# Palladium-Catalyzed Domino Coupling Reactions of Aryl Halides with Norbornene and Norbornene Derivatives - A Simple Route to Polycyclic Aromatic Compounds 

Karsten Albrecht ${ }^{\mathbf{a}}$, Oliver Reiser ${ }^{\mathbf{a}}$, Martin Weber ${ }^{\mathbf{b}}$, Burkhard Knieriem ${ }^{\mathbf{a}}$, and Armin de Meijere ${ }^{\mathbf{a}}{ }^{\text {* }}$<br>Institut fur Organische Chemie der Georg-August-Universität Göttingen ${ }^{\text {a }}$, Tammannstrasse 2, D-37077 Göttingen, Germany Institut für Organische Chemie der Universität Hamburg ${ }^{\text {b }}$, Martin-Luther-King-Platz 6, D-20146 Hamburg, Germany

#### Abstract

Under palladium-catalysis, norbornene 1, dicyclopentadiene 10, norbornenol 13, and norbornenone 15 react with unsubstituted as well as substituted bromo- and iodobenzenes to give $1: 3$ coupling products with 4 -aryl-9,10dihydrophenanthrene units with up to $70 \%$ isolated yields. The structures of two such products $4 \mathbf{a}$ and 4 c were proved by X -ray crystal structure analysis. 2-Bromothiophene 17 reacts with 1 and 10 to yield a mixture of $2: 1$ and $3: 1$ coupling products, while 3-iodopyridine 22a, 3-iodo-6-methylpyridine 22b and 4-iodopyridine 25 give only $2: 1$ coupling products with 5,6 -dihydro- 3,8 -phenanthroline and 5,6 -dihydro- 2,9 -phenanthroline units, respectively. Some new mechanistic insights into this interesting four-component domino coupling reaction are presented. The products can easily be transformed by photocyclization/dehydrogenation and/or flash vacuum pyrolysis to a variety of cyclopentadiene-anellated polycyclic aromatic compounds in very high yields. The reported sequence also presents the easiest access to benzolelpyrene.

## INTRODUCTION

Palladium-catalyzed sequential transformations, ${ }^{1}$ in which several new C,C bonds are formed in a single operation, have become a rapidly growing area of research, in which many imaginative new ideas have been tested and realized. ${ }^{2-7}$ Such transformations work particularly well for multifold alkene-alkene and alkenealkyne coupling reactions, in which all the sequential steps occur in an intramolecular fashion, but have also been reported for special intra-inter-intramolecular ${ }^{8 \mathrm{a}}$ and even inter-inter-intramolecular sequences. ${ }^{8 b, 9}$ In most of the latter examples, norbormene $\mathbf{1}$ has been the olefinic reaction partner, onto which alkynes as well as alkenyl and aryl halides have been coupled. ${ }^{8-10}$ Early on, Chiusoli et al. reported a sequential coupling of norbornene with two molecules of iodobenzene $\mathbf{2 a - I}$ (or bromobenzene $\mathbf{2 a - B r}$ ) to yield the norborneneanellated 9,10 -dihydrophenanthrene derivative $3 \mathrm{a} .{ }^{9}$ As we found later, 1 can also sequentially react with three molecules of an aryl halide 2-X to give norbornene-anellated 4 -phenyl-9,10-dihydrophenanthrene derivatives. ${ }^{10}$ We now report on the scope of this interesting four-component domino coupling reaction and some new mechanistic insights.

## SCOPE AND LIMITATIONS OF THE FOUR-COMPONENT DOMINO COUPLING

The apparent difference for the two reported coupling modes of norbornene with aryl halides lies in the reaction conditions. While Chiusoli et al. used $\mathrm{Pd}\left(\mathrm{PPh}_{3}\right)_{4}$ as a catalyst, and potassium $t$-butoxide as the base in anisole at $130^{\circ} \mathrm{C}, 9$ we applied the protocol developed by Jeffery ${ }^{11}$ with $\mathrm{Pd}(\mathrm{OAc})_{2}$ as the catalyst precursor,
potassium carbonate as the base in dimethylformamide (DMF) or $N$-methylpyrrolidone (NMP) at $60-100^{\circ} \mathrm{C}$, and with tetra- $n$-butylammonium bromide ${ }^{12}$ as a phase transfer catalyst. ${ }^{10}$ Under these conditions, bromo- 2 a $\mathbf{B r}$ and iodobenzene $\mathbf{2 a}$-I as well as the para-substituted aryl iodides $2 \mathbf{b}, \mathbf{c}, \mathrm{~d}, \mathrm{e}-\mathrm{I}$ with methoxy, fluoro, methyl and chloro substituents gave only the $3: 1$ coupling products $4 \mathrm{a}-\mathrm{e}$ (Scheme 1 and Table 1) except for biaryls as by-products in some cases. ${ }^{13}$ The exo-orientation of the 9,10 -dihydrophenanthrene units and the positions

9

Scheme 1
of substituents in these products were corroborated by the NMR spectroscopic data and rigorously proved by Xray crystal structure analyses for compounds $\mathbf{4 a}$ and $\mathbf{4 c}$ (see Figure 1). ${ }^{14}$

4c

Figure 1. Molecular structures of 4 a and 4 c in the crystals. ${ }^{14} 4 \mathrm{a}$ : Triclinic crystals of space group $P \overline{1}, Z=2$, unit cell dimensions $a=9.676(2), b=9.858(2), c=10.653(3) \AA, \alpha=117.46(1), \beta=95.73(2), \gamma=101.65(1)^{\circ}$, $V=861.1(3) \AA^{3}$. Crystal size $0.2 \times 0.5 \times 0.8 \mathrm{~mm}, T=293 \mathrm{~K}, 2353$ reflections collected, final $R_{w}=5.5 \%$. -4 c : Triclinic crystals of space group $P \overline{1}, Z=2$, unit cell dimensions $a=9.714(6), b=10.199(6)$, $c=10.809(10) \AA, \quad \alpha=117.47(6), \quad \beta=95.62(7), \quad \gamma=101.06(0)^{\circ}, \quad V=910.9(11) \AA^{3} . \quad$ Crystal $\quad$ size $1.0 \times 1.0 \times 1.0 \mathrm{~mm}, T=293 \mathrm{~K}, 2657$ reflections collected, final $R_{w}=4.8 \%$.

Aryl halides with unsaturated substituents in the para-position gave different results. ${ }^{16}$ While $p$-bromobenzonitrile $\mathbf{2 f}-\mathbf{B r}$ led to both the $2: 1$ and $\mathbf{3 : 1}$ coupling products $\mathbf{3 f}$ and $\mathbf{4 f}$, respectively, in poor yields, methyl $p$-iodobenzoate $\mathbf{2 g}$-I and $p$-iodonitrobenzene $\mathbf{2 h}-\mathrm{I}$ gave only the $2: 1$ coupling products $\mathbf{3 g}$ and $\mathbf{3 h}$, the latter was actually isolated as the dehydrogenated $2: 1$ product 5 , apparently due to the oxidizing ability of $p$ iodonitrobenzene.

With an ortho or meta methyl substituent on the aryl iodide as in $\mathbf{6 a}, \mathbf{6 b}$, the $3: 1$ domino products were mixtures of isomers and obtained in only 5 and $33 \%$ yield, respectively. Even 2-bromonaphthalene 7 could be coupled with norbornene, albeit the $3: 1$ product 9 was obtained in only $2 \%$ yield and the $2 ; 1$ product 8 in $6 \%$.

Table 1. Norbornene-Anellated 9,10-Dihydrophenanthrenes 3, 4-Phenyl-9,10-dihydrophenanthrenes 4, and Analogous Derivatives (for Details see Scheme 1).

a Yields based on the difference between employed and recovered starting material 2-X. - ${ }^{\text {b }}$ The NMR data of $4 d$ appear not be consistent with the positions of the methyl groups as indicated in the formula, but the structure was proved unambigously by X-ray structure analysis. - ${ }^{\mathrm{c}}$ 4-Chloro-3,5-dideuterioiodobenzene was used. - ${ }^{\mathrm{d}}$ Mixture of double bond isomers. - e Triphenylphosphine ( 4 equiv. with respect to $\mathrm{Pd}(\mathrm{OAc})_{2}$ ) was added. -f Mixture of endo- and exo-isomers ( $3.5: 1$ ). g Sodium bicarbonate instead of potassium carbonate was used in this case. ${ }^{-h}$ An unidentified second $1: 3$ coupling product was isolated in $5 \%$ yield.

On the other hand, substituents on the norbornene skeleton had no influence on the reaction mode. The less strained double bond in the anellated five-membered ring of dicyclopentadiene 10 remained untouched while three molecules of iodobenzene $2 \mathrm{a}-1$ were attached to the other double bond. The product 12 was a mixture of isomers with different positions of the double bond in the endo-cyclopentene unit. When triphenylphosphine was added to the catalyst cocktail, both the $2: 111$ and $3: 1$ domino products 12 were obtained ( 15 and $36 \%$, respectively). Norbornenol 13 and norbornenone 15 also gave the corresponding $1: 3$ coupling products 14 and 16 , respectively, in good yields. In order to avoid enolate formation in the case of 15, the weaker base sodium bicarbonate $\left(\mathrm{NaHCO}_{3}\right)$ was used instead of potassium carbonate. Because of the better solubility of $\mathrm{NaHCO}_{3}$ in DMF, no phase transfer catalyst $\mathrm{Bu}_{4} \mathrm{NBr}$ had to be added.

Heterocyclic aryl halides also underwent domino coupling reactions with norbornene 1 and dicyclopentadiene 10. 2-Bromothiophene 17 gave both the $2: 1$ and $3: 1$ products $\mathbf{1 8 / 2 0}$ and $19 / 21$, respectively, in

10

11

12

13

14

15

16
nearly equal yields (see Scheme 2); the conversion of 17 (or 2-iodothiophene) was only $50 \%$ even after 20 h at $90^{\circ} \mathrm{C}$. The composition of the product mixture was the same, when the coupling reaction was carried out in the presence of triphenylphosphine.

Scheme 2

The domino coupling of iodopyridines $22 \mathrm{a}, \mathrm{b}$ and 25 onto norbornene 1 and dicyclopentadiene 10 required even higher temperatures $\left(120^{\circ} \mathrm{C}\right)$ and the presence of triphenylphophine. In all cases, only $2: 1$ coupling products were obtained in up to $56 \%$ yield (Scheme 3).

26

Scheme 3

Unfortunately, the main products from 3-iodopyridines $22 a, b$ and 1 or 10 were not the ring-anellated 5,6 -dihydro-1,10-phenanthrolines, but the 3,8 -isomers 23a,b and 24a, respectively, with a trace ( $1 \%$ ) of the 1,8 -isomer being isolated from the reaction of 10 with 22a. Dicyclopentadiene 10 and 4 -iodopyridine 25 gave a single product, namely the ring-anellated 5,6-dihydro-2,9-phenanthroline 26 , but only in $25 \%$ yield. The positions of the nitrogen atoms in 24a and the exo-orientation of its dihydrophenanthroline unit were proved by an X-ray crystal structure analysis (see Figure 2). ${ }^{14}$

Crystal size $0.3 \times 0.6 \times 0.1 \mathrm{~mm}, T=293 \mathrm{~K}, 4336$ reflections collected, final $R_{w}=9.7 \%$.

## MECHANISTIC ASPECTS OF THE FOUR-COMPONENT DOMINO COUPLING

The previously proposed mechanism ${ }^{10 a}$ does not account for the positions of the three substituents in $1: 3$ coupling products from norbornene 1 and $p$-substituted aryl iodides, as revealed by the X-ray crystal structure analysis of $\mathbf{4 c}$ (see Figure 1). It is now generally accepted that the catalytic cycle of both the $1: 2$ and 1:3 domino coupling reactions involves alternately squaric $\operatorname{Pd}(I I)$ and octahedral $\operatorname{Pd}(\mathrm{IV})$ intermediates. ${ }^{17,18}$ But the sequence and regioselectivity of oxidative addition and C,C bond forming (reductive elimination) steps has to be consistent with the structure of $\mathbf{4 c}$, and the new experimental observation that the doubly labelled 4-chloro-3,5-dideuterioiodobenzene $2 \mathrm{e}-\mathrm{I}$ gives a $3: 1$ adduct 4 e with only five deuterium labels remaining in the molecule (see Scheme 4). This indicates that the 4 -aryl substituent in the resulting 4-aryl9,10 -dihydrophenanthrene derivative is being attached as the last group onto one of the former deuterium labelled positions meta to the iodine and ortho to the chlorine in $\mathbf{2 e}-\mathrm{I}$. The whole sequence undoubtedly begins with an exo-syn-addition of arylpalladium halide to norbornene, ${ }^{19}$ the resulting Pd(II) complex 27 cyclizes by elimination of hydrogen iodide to give the palladacycle $28,{ }^{20}$ which reacts in another oxidative addition step with 2e-I to yield the octahedral Pd(IV) complex 29. The subsequent elimination of hydrogen iodide, in which the proton comes from one of the ortho-positions of the aryl ligand, can lead to the aryne-Pd(IV) complex $30,{ }^{21}$ which can undergo reductive elimination to form the seven-membered palladacycle 31. In the presence of a triphenylphosphine ligand, the complex of type 31 can apparently undergo further reductive elimination to yield the corresponding norbornene-anellated 9,10 -dihydrophenanthrene derivative, as observed for the reaction of dicyclopentadiene 10 with 2a-I (see above). Eventually, the palladium(II) in 31 can undergo a third oxidative addition of aryl iodide, and the resulting Pd(IV) complex 32, in a sequence of hydrogen iodide

$2 \mathrm{e}-\mathrm{I}$

Scheme 4. Proposed mechanism for the four-component domino coupling of norbornene 1 and aryl iodides 2$\mathbf{X}$ as corroborated by an experiment with doubly labelled 4-chloro-3,5-dideuterioiodobenzene $\mathbf{2 e - I}$ (* indicates the position of deuterium labels in the intermediates).
elimination (deuterium iodide in this particular case) and two subsequent reductive elimination steps with $\mathrm{C}, \mathrm{C}$ bond formation via the aryne $\mathrm{Pd}(\mathrm{IV})$ complex $\mathbf{3 3}^{21}$ and the $\mathrm{Pd}(I I)$ complex 34, reconstitutes the catalytically active $\operatorname{Pd}(0)$ species to yield the observed $1: 3$ domino coupling product of type $\mathbf{4 e}$.

## TRANSFORMATIONS OF THE FOUR-COMPONENT DOMINO COUPLING PRODUCTS

The domino coupling products of type $\mathbf{3}$ and $\mathbf{4}$ offer an easy approach to a variety of other polycyclic aromatic compounds. ${ }^{10}$ As exemplified for 4 a , irradiation in cyclohexane in the presence of iodine results in cyclization with dehydrogenation of the 4 -phenyl-9,10-dihydrophenanthrene unit leading smoothly to the norbornene-anellated 4,5 -dihydrobenzo[e]pyrene derivative 35 ( $83 \%$, Scheme 5). Further dehydrogenation with dichlorodicyanobenzoquinone (DDQ) leads to the norbornene-anellated benzo[e]pyrene 38 ( $85 \%$ ). If instead, $\mathbf{4 a}$ is first dehydrogenated with DDQ to compound $37(67 \%)$, the photocyclization/dehydrogenation no longer takes place.

Upon flash vacuum pyrolysis (FVP, sublimation at 0.05 Torr through a $800^{\circ} \mathrm{C}$ hot quartz tube) ${ }^{22} 35$ cleanly cleaves off cyclopentene to give benzo[e]pyrene 36 ( $69 \%$ ). The dehydrogenated compound 38 , under the same pyrolysis conditions, yields $95 \%$ cyclopentadieno(l]benzo[e]pyrene 39 (Scheme 5). A better overall

43
Scheme 5
yield of this interesting ligand 39 for metal complexes ${ }^{10 b}, 23$ is obtained by photocyclization/dehydrogenation of $\mathbf{1 2}$, the $3: 1$ coupling product of iodobenzene $\mathbf{2 a} \mathbf{I}$ with dicyclopentadiene $\mathbf{1 0}$, and subsequent pyrolysis of $40(60 \%$ overall from 10), mainly because the dehydrogenation with DDQ is spared. The retro-Diels-Alder reaction ${ }^{24}$ of 40 is preceded by an intramolecular transfer of the two bridgehead hydrogens onto the double bond in the endo-oriented cyclopentene ring, 25 transforming 40 to 41 , which then easily cleaves off cyclopentene. In fact, cyclopentene was detected as the major volatile by-product in this and analogous pyrolyses, and ( $\mathrm{M}^{+}-\mathrm{C}_{5} \mathrm{H}_{8}$ ) was also the major fragment ion in all of the mass spectra of 11, 12, 20, 21, 24a, 26 and 40.26 In a control experiment, 40 was first hydrogenated over palladium on charcoal and the resulting 43 then pyrolyzed, but no retro-Diels-Alder product could be observed.

Consequently, all the domino coupling products obtained from dicyclopentadiene 10 and aryl halides cleanly cleaved to the corresponding cyclopentadiene-anellated oligocyclic arenes. Compound 12 gave a mixture of the two double bond regioisomers $(E)$ - and ( $Z$ )-42 in $85 \%$ yield (Scheme 5 ). The norbornene-

Scheme 6
annellated 4-phenylphenanthrene 37, which was obtained by dehydrogenation of 4a, could also be pyrolyzed to ( $E / Z$ )-42, but aside from the additional step, the overall yield was significantly lower ( 47 versus $59 \%$ ). Flash vacuum pyrolysis of dicyclopentadiene derived products 11, 20, 24a and 26 to 9:10-cyclopentadienophenanthrene 45, 4:5-cyclopentadienobenzo[1,2-b:4,3-b]dithiophene 46, 5:6-cyclopentadieno-3,8-phenanthroline 47 and 5:6-cyclopentadieno-2,9-phenanthroline 48 all proceeded with high yields ( $77-94 \%$, see Scheme 6).

## ACKNOWLEDGEMENTS

This work was supported by the "Volkswagen-Stiftung" and the "Fonds der Chemischen Industrie" as well as the Degussa AG, Hoechst AG and Hüls AG through generous gifts of chemicals. O. R. thanks the "Studienstiftung des deutschen Volkes" for a graduate fellowship. We are indebted to Dr. M. Noltemeyer, Institut für Anorganische Chemie, Georg-August-Universität Gö̈ttingen, for carrying out the reported crystal structure analyses, and to S . Beußhausen for his technical assistance.

## Domino Coupling of Aryl Halides and Norbornene

General Procedure 1 (GP 1): To a mixture of 3 mmol of aryl halide, 6 mmol of $\mathrm{K}_{2} \mathrm{CO}_{3}, 3 \mathrm{mmol}$ of tetrabutylammonium bromide, and 0.03 mmol of palladium acetate in anhydrous NMP was added at $65-85^{\circ} \mathrm{C}$ simultaneously via a syringe pump a solution of 1 mmol of alkene in NMP and a solution of 0.06 mmol of palladium acetate in NMP at a rate of $2-3 \mathrm{mmol}$ of alkene per hour. The reaction mixture was further stirred at this temperature for the stated length of time. The reaction mixture was diluted with 100 ml of dichloromethane and extracted with 5 portions of water ( 100 ml each), the organic layer was dried over $\mathrm{MgSO}_{4}$, then the solvents were evaporated, and the residue was purified by chromatography and/or recrystallisation.
exo-(4-Phenyl-9,10-dihydrophenanthreno)-2':3',9:10-norbornane (4a): According to GP 1 , to a mixture of $6.50 \mathrm{~g}(31.8 \mathrm{mmol})$ of $2 \mathrm{a}-\mathrm{I}, 10.27 \mathrm{~g}(31.9 \mathrm{mmol})$ of $\mathrm{Bu}_{4} \mathrm{NBr}, 8.82 \mathrm{~g}(63.8 \mathrm{mmol})$ of $\mathrm{K}_{2} \mathrm{CO}_{3}$ and 24 mg ( 0.11 mmol ) of $\mathrm{Pd}(\mathrm{OAc})_{2}$ in 30 ml of NMP was added at $65^{\circ} \mathrm{C}$ during 4.5 h a solution of $1.00 \mathrm{~g}(10.6 \mathrm{mmol})$ of 1 in 5 ml of NMP and a solution of $48 \mathrm{mg}(0.21 \mathrm{mmol})$ of $\mathrm{Pd}(\mathrm{OAc})_{2}$ in 5 ml of NMP. The mixture was further heated for 2 d at $65^{\circ} \mathrm{C}$. ## Palladium-Catalyzed Coupling of Norbornene (1) or Dicyclopentadiene (10) with N-Heterocycles

General Procedure 3 (GP 3): Under nitrogen a mixture of $1.90 \mathrm{~g}(13.7 \mathrm{mmol})$ of $\mathrm{K}_{2} \mathrm{CO}_{3}, 2.20 \mathrm{~g}$ ( 6.8 mmol ) of $\mathrm{Bu}_{4} \mathrm{NBr}, 33.6 \mathrm{mg}(0.15 \mathrm{mmol})$ of $\mathrm{Pd}(\mathrm{OAc})_{2}$, and $157 \mathrm{mg}(0.6 \mathrm{mmol})$ of $\mathrm{PPh}_{3}$ in 20 ml of DMF was heated at $70^{\circ} \mathrm{C}$ for 30 min . Subsequently, a solution of 5.0 mmol of alkene and 10.0 mmol of pyridyl halide in 15 ml of DMF was added during 12 h . The temperature was raised to $120^{\circ} \mathrm{C}$, stirring continued for 24 h . After cooling to r. t. 150 ml of MTBE was added, the solids were removed by filtration, and the solution was extracted twice with 50 ml of 2 N HCl each. The combined aqueous layers were extracted with 50 ml of MTBE, and after addition of solid $\mathrm{NaOH}(\mathrm{pH}=12)$, extracted again with 4 portions of MTBE ( 50 ml each). The combined organic layers from the last extraction cycle were washed twice with 50 ml of water each, dried and concentrated. The residue was purified by chromatography on $\mathrm{Al}_{2} \mathrm{O}_{3}$ ( $\mathrm{PE} / \mathrm{MTBE} /$ pyridine $10: 10: 1$ ).

12. In most cases, the less expensive tetra- $n$-butylammonium bromide could be substituted for the chloride originally used by Jeffery, ${ }^{11}$ with as good results.
13. In the absence of norbornene, the palladium catalyzed aryl aryl coupling can be achieved with yields up to $87 \%$, by raising the reaction temperature to $150^{\circ} \mathrm{C} . \mathrm{Cf} . \mathrm{K}$. Albrecht, M. Weber, A. de Meijere, unpublished results. - M. Weber, Dissertation, Universität Hamburg, 1992; K. Albrecht, Dissertation, Universität Göttingen, 1993. - This is superior to a recently published palladium-catalyzed aryl aryl coupling which requires the presence of triphenylarsine: M. Brenda, A. Knebelkamp, A. Greiner, W. Heitz, Synlett 1991, 11, 809-810.
14. Siemens Stoe AED 2 diffractometer, Mo- $K_{\alpha}$ radiation, structures were solved with SHELXTL-PLUS. ${ }^{15}$ Further details of these crystal structure investigations are available on request from the Fachinformationszentrum Energie Physik Mathematik GmbH, D-76344 Eggenstein-Leopoldshafen, on quoting the depository number CSD-57602, the names of the authors, and the journal citation.
15. G. M. Sheldrick, SHELXTL-PLUS: Program for Crystal Structure Determination, Göttingen 1986.
16. A rate retarding effect of electron-withdrawing substituents in palladium catalyzed aryl halide coupling reactions has been noted. Cf. P. J. Harrington, K. A. DiFiore, Tetrahedron Lett. 1987, 28, 495-498.
17. M. Catellani, G. P. Chiusoli, C. Castagnoli, J. Organomet. Chem. 1991, 407, C30-C33; M. Catellani, G. P. Chiusoli, ibid. 1988, 346, C27-C30, and earlier references cited therein. - For a detailed mechanistic study see: J. M. Brown, N. A. Cooley, Organometallics 1990, 9, 353-359.
18. For a review on the role of Pd(IV) complexes see: A. J. Canty, Acc. Chem. Res. 1992, 25, 83-90.
19. The primary addition product of phenylpalladium iodide to norbornene, a complex of type 29 with $\mathrm{L}=\mathrm{PPh}_{3}$, has been isolated and fully characterized by X -ray crystal structure analysis. C .-S. Li, $\mathrm{C} . \mathrm{H}$. Cheng, F.-L. Liao, S.-L. Wang, J. Chem. Soc., Chem. Commun. 1991, 710-712.
20. M. Catellani, G. P. Chiusoli, J. Organomet. Chem. 1992, 425, 151-154, and earlier references cited therein.
21. This is conceived in close analogy to known aryne $\mathrm{Pt}(\mathrm{II})$ complexes. Cf. M. A. Bennett, H. P. Schwemlein, Angew. Chem. 1989, 101, 1349-1373; Angew. Chem. Int. Ed. Engl. 1989, 28, 1296. The frequently formulated possibility (cf. B. A. Markies, P. Wijkens, H. Kooijman, A. L. Spek, J. Boersma, G. van Koten, J. Chem. Soc., Chem. Commun. 1992, 1420-1423 and references cited therein) that the ortho $\mathrm{C}-\mathrm{H}$ activation occurs as a consequence of an electrophilic attack of $\mathrm{Pd}(\mathrm{II})$ or $\mathrm{Pd}(\mathrm{IV})$ on the adjacent arene unit appears to be less likely in this case, as it would bave to occur via a highly distorted $\sigma$-complex.
