Received 24 November 1998; accepted 7 January 1999

#### Abstract

Three new oligostilbenes having a benzofuran moiety, viniferifuran, $(+)$-vitisifuran A and $(-)$-vitisifuran B , were isolated from Viiis vinifera 'Kyohou'. The structures of these oligostilbenes including the absolute configuration were elucidated by spectroscopic and chemical methods. Furthermore, these were chemically transformed from ( + )- $\mathrm{\varepsilon}$-viniferin, ( + )-vitisin A and (-)-vitisin B, respectively, whose absolute configurations are known. © 1999 Elsevier Science Ltd. Keywords: Benzofurans; Natural products; Oligomers; Dehydrogenation.

## INTRODUCTION

In previous papers, ${ }^{14}$ we reported the isolation and structures of oligostilbenes having dihydrobenzofuran moieties isolated from the corks of Vitis vinifera 'Kyohou' cultivated in Wakayama Prefecture. Continuous study of the constituents of the above plant led to the isolation of three novel oligostilbenes, viniferifuran (1), ( + )vitisifuran A (2) and ( - -vitisifuran B(3) having a benzofuran moiety, respectively. These compounds 1,2 and 3 fluoresce a light-blue color when exposed to ultraviolet light. The structures, including their absolute configurations, were determined on the basis of the spectroscopic and chemical evidence. Furthermore, viniferifuran (1), ( + )-vitisifuran A(2) and ( - -vitisifuran B (3) were successfully transformed from ( + )- $\varepsilon$ viniferin (4), (+)-vitisin $A(5)$ and ( - )-vitisin $B(6)$, respectively.

## RESULTS AND DISCUSSION

Structure of viniferifuran (1) Viniferifuran (1) showed a quasimolecular ion peak at $m / z 453.1341$ [ $\mathrm{MH}^{+}$] $\left(m / z 453.1338\right.$ calcd. for $\left.\mathrm{C}_{28} \mathrm{H}_{21} \mathrm{O}_{6}\right)$ in the high resolution FAB-MS. As shown in Tables 1 and 2 , the ${ }^{1} \mathrm{H}-$ and ${ }^{13} \mathrm{C}$-NMR spectral data of viniferifuran (1) resembled very closely those of ( + )- $\varepsilon$-viniferin (4) ${ }^{5}$ except for the olefinic signals ( $1 ; \delta_{\mathrm{c}} 150.6$ (C-7a), 117.4 (C-8a), $4 ; \delta_{\mathrm{H}} 5.36$ (d, $J=6.6 \mathrm{~Hz}, \mathrm{H}-7 \mathrm{a}$ ), 4.34 (d, $J=6.6 \mathrm{~Hz}, \mathrm{H}-8 \mathrm{a}$ ), $\delta_{\mathrm{c}} 94.8$ (C-7a), 58.3 (C-8a)). In the HMBC spectrum of 1 , cross peaks between $\mathrm{C}-7 \mathrm{a}$ and $\mathrm{H}-2 \mathrm{a}$ ( 6 a ) and between $\mathrm{C}-8 \mathrm{a}$ and $\mathrm{H}-10 \mathrm{a}$ (14a) were observed. These indicated viniferifuran (1) to be a dehydro- $\mathrm{\varepsilon}$-viniferin and this was unambiguously substantiated by the following evidence. The methylation of 1 with methyl iodide and potassium carbonate in acetone gave a pentamethyl ether (7) ( $\mathrm{m} / \mathrm{z} 523\left[\mathrm{MH}^{+}\right]$). The ether 7 was oxidized with ozone followed by treatment with dimethyl sulfide to give three degradative products 8, 9 and 10 in 40.9, 39.1

[^0]and 9.7 \% yields, respectively. The product 8 was identical with 4 -methoxybenzaldehyde by comparison with an authentic sample. The product $9\left(\mathrm{~m} / \mathrm{z} 419\left[\mathrm{MH}^{+}\right], \delta_{\mathrm{H}} 3.78(3 \mathrm{H}, \mathrm{s}, \mathrm{MeO}-4 \mathrm{a}), 3.77(6 \mathrm{H}, \mathrm{s}, \mathrm{MeO}-11 \mathrm{a}, 13 \mathrm{a}), 3.90\right.$ (3H, s, MeO-13b), 9.75 (1H, s, H-8b), $\delta_{\text {c }} 152.2$ (C-7a), 114.9 (C-8a), 189.7 (C-8b)) was characterized as 2-(4-methoxyphenyl)-3-(3,5-dimethoxyphenyl)-4-formyl-6-methoxybenzofuran. The product $10\left(\mathrm{~m} / \mathrm{z} 451\left[\mathrm{MH}^{+}\right], \delta_{\mathrm{H}}\right.$ $3.82(3 \mathrm{H}, \mathrm{s}, \mathrm{MeO}-4 \mathrm{a}), 3.71(6 \mathrm{H}, \mathrm{s}, \mathrm{MeO}-11 \mathrm{a}, 13 \mathrm{a}), 3.93(3 \mathrm{H}, \mathrm{s}, \mathrm{MeO}-13 \mathrm{~b}), 9.88(1 \mathrm{H}, \mathrm{s}, \mathrm{H}-8 \mathrm{~b}), \delta_{\mathrm{c}} 163.7$ (C7a), 193.5 (C-8a), 189.4 (C-8b)) was characterized as 2-(3,5-dimethoxybenzoyl)-3-(4-methoxybenzoyloxy)-5methoxybenzaldehyde, which was apparently produced by further oxidation of 9 with ozone. Thus, the structure of viniferifuran is represented as 1 . Finally, ( + )- $\varepsilon$-viniferin (4) was successfully converted into viniferifuran (1), as follows. ( + )-e-Viniferin (4) was acetylated with acetic anhydride and pyridine to give ( + )-e-viniferin pentaacetate (11) ( $\mathrm{m} / \mathrm{z} 665\left[\mathrm{MH}^{+}\right], \delta_{\mathrm{c}} 92.7(\mathrm{C}-7 \mathrm{a}), 56.6(\mathrm{C}-8 \mathrm{a})$ ). The acetate (11) was oxidized with 2,3-dichloro-5,6-dicyano-1,4-benzoquinone (DDO) in toluene to give a dehydrogenated ester (12) ( $\mathrm{m} / \mathrm{z} 663\left[\mathrm{MH}^{+}\right]$, $\delta_{c} 151.1$ (C-7a), 116.0 (C-8a)). The ester (12) was treated with potassium hydroxide in methanol to give a phenol, which was completely identical with natural viniferifuran (1).

Structure of (+)-vitisifuran A(2) (+)-Vitisifuran A(2), $[\alpha]_{\mathrm{D}}+236.1^{\circ}$ (c 0.44, MeOH), showed a quasimolecular ion peak at $m / z 905.2593\left[\mathrm{MH}^{+}\right]\left(m / z 905.2598\right.$ calcd. for $\left.\mathrm{C}_{56} \mathrm{H}_{41} \mathrm{O}_{12}\right)$ in the high resolution FABMS. As shown in Tables 1 and 2 , the ${ }^{1} \mathrm{H}$ - and ${ }^{13} \mathrm{C}$-NMR spectral data of ( + )-vitisifuran $\mathrm{A}(2)$ resembled very closely those of ( + )-vitisin A (5) ${ }^{4}$ except for the olefinic signals ( $2 ; \delta_{c} 150.5$ (C-7a), 117.4 (C-8a), $5 ; \delta_{H} 5.31$ (d, $J=6.3 \mathrm{~Hz}, \mathrm{H}-7 \mathrm{a}), 4.26$ (d, $J=6.3 \mathrm{~Hz}, \mathrm{H}-8 \mathrm{a}$ ), $\delta_{\mathrm{c}} 94.7$ (C-7a), 58.2 (C-8a)). Furthermore, the NMR data of the partial structure corresponding to viniferifuran (1) in (+)-vitisifuran $A(2)$ were very similar to those of 1 . In the HMBC spectrum of 2 , cross peaks between $\mathrm{C}-7 \mathrm{a}$ and $\mathrm{H}-2 \mathrm{a}$ (6a), between $\mathrm{C}-8 \mathrm{a}$ and $\mathrm{H}-10 \mathrm{a}$ (14a), between C 7 d and $\mathrm{H}-2 \mathrm{~d}(6 \mathrm{~d})$ and between $\mathrm{C}-8 \mathrm{~d}$ and $\mathrm{H}-14 \mathrm{~d}$ were observed. These indicated (+)-vitisifuran $\mathrm{A}(2)$ to be a structure dehydrogenated between $\mathrm{H}-7 \mathrm{a}$ and $\mathrm{H}-8 \mathrm{a}$ of $(+)$-vitisin $\mathrm{A}(5)$. This was further supported by the following chemical evidence. The methylation of 2 with methyl iodide and potassium carbonate in acetone gave a decamethyl ether (13) $\left(m / z 1045\left[\mathrm{MH}^{+}\right]\right)$. The ether (13) was oxidized with ozone followed by treatment with dimethyl sulfide to give three degradative products 9,10 and 14 in $47.5,15.1$ and $53.2 \%$ yields, respectively. The product 14 was identical with an aldehyde derived from (+)-vitisin A (5), including the sign of the optical rotation. Finally, (+)-vitisifuran A (2) was successfully converted from (+)-vitisin A(5) as follows. (+)-Vitisin A (5) was acetylated with acetic anhydride and pyridine to give decaacetyl (+)-vitisin A(15)(m/z $1327\left[\mathrm{MH}^{+}\right], \delta_{\mathrm{C}}$ 92.6 (C-7a), 56.5 (C-8a)). The acetate (15) was oxidized with DDQ in toluene to give a dehydrogenated ester (16) ( $\mathrm{m} / \mathrm{z} 1325\left[\mathrm{MH}^{+}\right], \delta_{\mathrm{c}} 150.7(\mathrm{C}-7 \mathrm{a}), 116.0(\mathrm{C}-8 \mathrm{a})$ ). The ester (16) was treated with potassium hydroxide in methanol to give a phenol, which was completely identical with natural (+)-vitisifuran $A(2)$, including the sign of the optical rotation. Thus, the absolute structure of (+)-vitisifuran A is represented as 2.

Structure of (-)-vitisifuran B (3) (-)-Vitisifuran B (3), $[\alpha]_{\mathrm{D}}-133.7^{\circ}$ (c $\left.0.12, \mathrm{MeOH}\right)$, showed a quasimolecular ion peak at $m / z 905.2618\left[\mathrm{MH}^{+}\right]\left(m / z 905.2598\right.$ calcd. for $\left.\mathrm{C}_{56} \mathrm{H}_{41} \mathrm{O}_{12}\right)$ in the high resolution FAB MS. As shown in Tables 1 and 2, the ${ }^{1} \mathrm{H}$ - and ${ }^{13} \mathrm{C}$-NMR spectral data of ( - )-vitisifuran B (3) resembled very closely those of $(-)$-vitisin $B(6)^{6}$ except for the olefinic signals ( $3 ; \delta_{C} 150.6(\mathrm{C}-7 \mathrm{a}), 117.4(\mathrm{C}-8 \mathrm{a}), 6 ; \delta_{\mathrm{H}} 5.33$ (d, $J=4.8 \mathrm{~Hz}, \mathrm{H}-7 \mathrm{a}), 4.36(\mathrm{~d}, J=4.8 \mathrm{~Hz}, \mathrm{H}-8 \mathrm{a}), \delta_{\mathrm{c}} 94.7$ (C-7a), 57.9 (C-8a)). Furthermore, the NMR data of the partial structure corresponding to viniferifuran (1) in (-)-vitisifuran $B$ (3) were very similar to those of 3 . In the HMBC spectrum of 3 , cross peaks between $\mathrm{C}-7 \mathrm{a}$ and $\mathrm{H}-2 \mathrm{a}(6 \mathrm{a})$, between $\mathrm{C}-8 \mathrm{a}$ and $\mathrm{H}-10 \mathrm{a}(14 \mathrm{a})$, between $\mathrm{C}-7 \mathrm{~d}$

and $\mathrm{H}-2 \mathrm{~d}$ ( 6 d ) and between $\mathrm{C}-8 \mathrm{~d}$ and $\mathrm{H}-10 \mathrm{~d}(14 \mathrm{~d})$ were observed. These indicated $(-)$-vitisifuran $\mathrm{B}(3)$ to be a structure dehydrogenated between $\mathrm{H}-7 \mathrm{a}$ and $\mathrm{H}-8 \mathrm{a}$ of $(-)$-vitisin B (6). ${ }^{6}$ This was further supported by the following chemical evidence. The methylation of 3 with methyl iodide and potassium carbonate in acetone gave a nonamethyl ether (17) ( $\mathrm{m} / \mathrm{z} 1031\left[\mathrm{MH}^{+}\right]$). The ether (17) was oxidized with ozone followed by treatment with dimethyl sulfide to give three degradative products 9,10 and 18 in $33.6 \%, 22.9 \%$ and $59.6 \%$ yields, respectively. The product 18 was identical with an aldehyde derived from (-)-vitisin B(6). ${ }^{6}$ Finally, ( - )vitisifuran B (3) was successfully converted from (-)-vitisin B (6) as follows. (-)-Vitisin B (6) was acetylated with acetic anhydride and pyridine to give ( - )-vitisin B nonaacetate (19) ( $\mathrm{m} / \mathrm{z} 1285\left[\mathrm{MH}^{+}\right], \delta_{\mathrm{c}} 92.59$ (C-7a), 56.0 , (C-8a), 90.7 (C-7c), 52.1 (C-8c), 92.62 (C-7d), $56.6(\mathrm{C}-8 \mathrm{~d})$ ). The nonaacetate (19) was oxidized with DDQ in toluene to give three dehydrogenated esters $20\left(\mathrm{~m} / \mathrm{z} 1283\left[\mathrm{MH}^{+}\right], \delta_{\mathrm{c}} 92.6(\mathrm{C}-7 \mathrm{a}), 56.3(\mathrm{C}-8 \mathrm{a}), 150.4\right.$ (C-7c), 114.2 (C-8c), 92.4 (C-7d), 56.0 (C-8d)), 21 ( $\mathrm{m} / \mathrm{z} 1283$ [MH $\left.{ }^{+}\right], \delta_{\mathrm{c}} 150.6$ (C-7a), 116.1 (C-8a), 90.6 (C-7c), 51.6 (C-8c), 92.6 (C-7d), 56.1 (C-8d)) and $22\left(\mathrm{~m} / \mathrm{z} 1281\left[\mathrm{MH}^{+}\right], \delta_{\mathrm{C}} 150.6(\mathrm{C}-7 \mathrm{a}), 116.1\right.$ (C-8a), 150.3 (C-7c), 114.3 (C-8c), 92.4 (C-7d), 56.2 (C-8d)) in $8.4 \%, 9.5 \%$ and $1.5 \%$ yields, respectively.

The first compound was assigned to a benzofuran (20) dehydrogenated between $\mathrm{H}-7 \mathrm{c}$ and $\mathrm{H}-8 \mathrm{c}$ of (-)vitisin B nonaacetate (19) on the basis of the HMBC spectral analysis. ${ }^{7}$ The second compound was assigned to a benzofuran (21) dehydrogenated between $\mathrm{H}-7 \mathrm{a}$ and $\mathrm{H}-8 \mathrm{a}$ of ( - --vitisin B nonaacetate (19) on the basis of the HMBC spectral analysis. ${ }^{8}$ Compound 21 was treated with potassium hydroxide in methanol to give a phenol, which was completely identical with natural ( - )-vitisifuran B(3), including the sign of the optical rotation. Thus, the absolute structure of $(-)$-vitisifuran B is represented as 3 . The third compound was assigned to a benzofuran (22) further dehydrogenated between $\mathrm{H}-7 \mathrm{a}$ and $\mathrm{H}-8 \mathrm{a}$ of 20 and between $\mathrm{H}-7 \mathrm{c}$ and $\mathrm{H}-8 \mathrm{c}$ of 21 on the basis of the spectral and chemical evidence. ${ }^{9}$ Both compounds $\mathbf{2 0}$ and 21 were treated with DDQ in toluene to give the same product 22, respectively.

## EXPERIMENTAL

General procedure. IR spectra were recorded on JASCO FT/RR-5000 and FT/IR-410 infrared spectrophotometers. UV spectra were recorded on a JASCO Ubest V-560 spectrophotometer (cell length 10 mm , unless otherwise indicated). Optical rotations were determined on a JASCO P-1020 polarimeter (cell length 100 mm , unless otherwise indicated). CD spectra were taken on JASCO J-600 and J-720 spectropolarimeters (cell length 10 mm , unless otherwise indicated). FABMS were measured with a JEOL HX- 110 using $m$-nitrobenzyl alcohol as a matrix unless otherwise indicated. ${ }^{1} \mathrm{H}$ - and ${ }^{13} \mathrm{C}$-NMR spectra were recorded on a JEOL A-600 spectrometer.

Isolation of viniferifuran and ( - )-vitisifuran B. The newly prepared ethyl acetate soluble fraction (414 mg ) corresponding to the third fraction of the acetone extract of the cork of the plant Vitis vinifera 'Kyohou' described previously ${ }^{2}$ was subjected to reversed-phase MPCC (Nomura Chemical Co. Ldd., Develosil Lop C8$45 S$ ( $\phi 4.5 \times 45 \mathrm{~cm}$, methanol - water ( $6: 4$ ), flow rate: $2 \mathrm{ml} / \mathrm{min}$ ) ) to give 10 fractions ( $9 \mathrm{mg}, 61 \mathrm{mg}, 61 \mathrm{mg}, 177$ $\mathrm{mg}, 59 \mathrm{mg}, 9 \mathrm{mg}, 4 \mathrm{mg}, 2 \mathrm{mg}, 9 \mathrm{mg}$ and 15 mg , respectively). The fifth fraction ( 59 mg ) was mainly composed of ( - )-vitisin B. The sixth fraction ( 9 mg ) was further subjected to preparative TLC [Merck, $1.05715(0.25 \mathrm{~mm}$, $20 \times 20 \mathrm{~cm}$ ), chloroform - methanol (5:1)] to give viniferifuran (1) and (-)-vitisifuran B(3) in yields of 1.3 mg and 1.9 mg , respectively.

Isolation of ( + )-vitisifuran $A$ and (-)-vitisifuran $B$. The eluting fraction ( 580 mg ) after ( + )-vitisin C and (-)-vitisin B from the ethyl acetate soluble fraction of the methanol extract of the cork of the plant Vitis vinifera 'Kyohou' described previously' was subjected to reversed phase MPCC (Nomura Chemical Co. Ltd., Develosil Lop C8-45S ( $\phi 4.5 \times 45 \mathrm{~cm}$, methanol - water ( $6: 4$ ), flow rate: $3 \mathrm{ml} / \mathrm{min}$ )) to give 5 fractions ( 442 mg , $20 \mathrm{mg}, 5 \mathrm{mg}, 3 \mathrm{mg}$ and 11 mg , respectively). The first fraction ( 442 mg ) was mainly composed of (-)-vitisin B. The second fraction ( 20 mg ) was further subjected to preparative TLC [Merck, $1.05715(0.25 \mathrm{~mm}, 20 \times 20 \mathrm{~cm}$ ), chloroform - methanol (4:1)] to give (-)-vitisifuran B(3) and (+)-vitisifuran A(2) in yields of 14 mg and 0.3 mg , respectively.

## Physical properties of viniferifuran.

1: A colorless amorphous powder; Rf 0.31 [TLC (Merck, 1.05715 ( 0.25 mm )), chloroform - methanol (4:1)]; $\mathrm{UV}(\mathrm{MeOH}) \lambda_{\max } \mathrm{nm}(\log \varepsilon): 209(4.79), 227 \mathrm{sh}(4.62), 258(4.33), 289 \mathrm{sh}(4.44), 308(4.53), 317(4.54), 337$ (4.53), $350 \mathrm{sh}(4.52)$; IR $v_{\max }(\mathrm{KBr}) \mathrm{cm}^{-1}: 3400 \mathrm{br}, 1605$; HR-FABMS m/z: $453.1341\left(\mathrm{MH}^{+} ; \mathrm{C}_{28} \mathrm{H}_{21} \mathrm{O}_{6}\right)$, calcd. 453.1338; ${ }^{1} \mathrm{H}-\mathrm{NMR}\left(\mathrm{CD}_{3} \mathrm{OD}\right)$ given in Table $1 ;{ }^{13} \mathrm{C}-\mathrm{NMR}\left(\mathrm{CD}_{3} \mathrm{OD}\right)$ given in Table 2.

## Physical properties of (+)-vitisifuran A.

2: A colorless amorphous powder; Rf 0.11 [TLC (Merck, 1.05715 ( 0.25 mm )), chloroform - methanol (4:1)]; $[\alpha]_{\mathrm{D}}+236.1^{\circ}(c 0.44, \mathrm{MeOH}) ; \mathrm{UV}(\mathrm{MeOH}) \lambda_{\max } \mathrm{nm}(\log \varepsilon) ; 208(5.07), 232 \operatorname{sh}(4.82), 286(4.41), 313$ (4.39), 322 (4.39), $340 \mathrm{sh}(4.45), 356(4.50) ; \mathrm{CD}(\mathrm{MeOH}) \Delta \varepsilon(\mathrm{nm}) ;+19(292),+75(237),+70(209) ;$ IR $v_{\text {max }}(\mathrm{KBr})$ $\mathrm{cm}^{-1}: 3300 \mathrm{br}, 1610$; HR-FABMS $m / z: 905.2593\left(\mathrm{MH}^{+} ; \mathrm{C}_{56} \mathrm{H}_{41} \mathrm{O}_{12}\right.$ ), calcd. $905.2598 ;{ }^{1} \mathrm{H}-\mathrm{NMR}\left(\mathrm{CD}_{3} \mathrm{OD}\right)$ given in Table 1; ${ }^{13} \mathrm{C}-\mathrm{NMR}\left(\mathrm{CD}_{3} \mathrm{OD}\right)$ given in Table 2.

## Physical properties of (-)-vitisifuran B.

3: A colorless amorphous powder; Rf 0.30 [TLC (Merck, $1.05715(0.25 \mathrm{~mm})$ ), chloroform - methanol (4:1)]; $[\alpha]_{\mathrm{D}}-133.7^{\circ}(c 0.12, \mathrm{MeOH}) ; \mathrm{UV}(\mathrm{MeOH}) \lambda_{\text {max }} \mathrm{nm}(\log \varepsilon) ; 204$ (4.99), $228 \operatorname{sh}(4.75), 287(4.29), 297$ (4.28), 324 (4.31), $357 \mathrm{sh}(4.25) ; \mathrm{CD}(\mathrm{MeOH}) \Delta \varepsilon(\mathrm{nm}) ;+1.3$ (367), $-5.0(304),+7.3(252),+6.0(237),-16.0(220)$, +13.3 (208); IR $v_{\max }(\mathrm{KBr}) \mathrm{cm}^{-1}: 3400 \mathrm{br}, 1615$; HR-FABMS m$/ z: 905.2618\left(\mathrm{MH}^{+} ; \mathrm{C}_{56} \mathrm{H}_{41} \mathrm{O}_{12}\right)$, calcd. $905.2598 ;{ }^{1} \mathrm{H}-\mathrm{NMR}\left(\mathrm{CD}_{3} \mathrm{OD}\right)$ given in Table $1 ;{ }^{13} \mathrm{C}-\mathrm{NMR}\left(\mathrm{CD}_{3} \mathrm{OD}\right)$ given in Table 2.

Methylation of viniferifuran. A mixture of viniferifuran (1) ( $3.0 \mathrm{mg}, 6.6 \mu \mathrm{~mol}$ ), methyl iodide ( 96 mg ) and potassium carbonate ( 94 mg ) in acetone ( 1 ml ) was stirred under nitrogen atmosphere at room temperature for 2 days. The reaction mixture was diluted by ethyl acetate ( 20 ml ), washed with brine and then dried over sodium sulfate. After evaporation of the solvent, the residue was subjected to preparative TLC [Merck, 1.05715 (0.25 $\mathrm{mm}, 20 \times 20 \mathrm{~cm}$ ), hexane - acetone ( $2: 1$ )] to give a pentamethyl derivative (7) in a yield of $2.4 \mathrm{mg}(69.3 \%$ ).
7: HR-FABMS m/z: $523.2124\left(\mathrm{MH}^{+} ; \mathrm{C}_{33} \mathrm{H}_{31} \mathrm{O}_{6}\right.$ ), calcd. 523.2121 ; IR $v_{\max }$ (film) $\mathrm{cm}^{-1}: 3020,1605 ;{ }^{1} \mathrm{H}-\mathrm{NMR}$ $\left(\mathrm{CDCl}_{3}\right) \delta_{\mathrm{H}} 7.52(2 \mathrm{H}, \mathrm{d}, J=9.2 \mathrm{~Hz}, \mathrm{H}-2 \mathrm{a}, 6 \mathrm{a}), 6.81(2 \mathrm{H}, \mathrm{d}, J=9.2 \mathrm{~Hz}, \mathrm{H}-3 \mathrm{a}, 5 \mathrm{a}), 6.65(2 \mathrm{H}, \mathrm{d}, J=2.2 \mathrm{~Hz}, \mathrm{H}-$ $10 \mathrm{a}, 14 \mathrm{a}), 6.62(1 \mathrm{H}, \mathrm{t}, J=2.2 \mathrm{~Hz}, \mathrm{H}-12 \mathrm{a}), 7.01(2 \mathrm{H}, \mathrm{d}, J=8.8 \mathrm{~Hz}, \mathrm{H}-2 \mathrm{~b}, 6 \mathrm{~b}), 6.77(2 \mathrm{H}, \mathrm{d}, J=8.8 \mathrm{~Hz}, \mathrm{H}-3 \mathrm{~b}, 5 \mathrm{~b})$, $6.87(1 \mathrm{H}, \mathrm{d}, J=16.1 \mathrm{~Hz}, \mathrm{H}-7 \mathrm{~b}), 6.84(1 \mathrm{H}, \mathrm{d}, J=16.1 \mathrm{~Hz}, \mathrm{H}-8 \mathrm{~b}), 6.99(1 \mathrm{H}, \mathrm{d}, J=2.2 \mathrm{~Hz}, \mathrm{H}-12 \mathrm{~b}), 7.09(1 \mathrm{H}, \mathrm{d}$, $J=2.2 \mathrm{~Hz}, \mathrm{H}-14 \mathrm{~b}), 3.78(3 \mathrm{H}, \mathrm{s}, \mathrm{MeO}-4 \mathrm{a}), 3.73(6 \mathrm{H}, \mathrm{s}, \mathrm{MeO}-1 \mathrm{a}, 13 \mathrm{a}), 3.79(3 \mathrm{H}, \mathrm{s}, \mathrm{MeO}-4 \mathrm{~b}), 3.90(3 \mathrm{H}, \mathrm{s}$, MeO-13b); ${ }^{13} \mathrm{C}-\mathrm{NMR}\left(\mathrm{CDCl}_{3}\right) \delta_{\mathrm{C}} 123.5$ (s, C-1a), 127.5 (d, C-2a,6a), 113.9 (d, C-3a,5a), 159.2 (s, C-4a), 149.7 (s, C-7a), 116.3 (s, C-8a), 136.9 (s, C-9a), 108.5 (d, C-10a, 14a), 161.4 (s, C-11a,13a), 100.4 (d, C-

Ozonolysis of decamethyl (+)-vitisifuran A. A solution of decamethyl-(+)-vitisifuran A (13) ( 20 mg , $19.2 \mu \mathrm{~mol}$ ) in ethyl acetate ( 15 ml ) was cooled at $-78^{\circ} \mathrm{C}$, treated with ozone for 1 min , and then worked up with dimethyl sulfide ( 0.5 ml ) to give a resulting mixture. The mixture was separated by preparative TLC (Merck $1.05715(0.25 \mathrm{~mm}, 20 \times 20 \mathrm{~cm})$, hexane - acetone ( $2: 1)$ ) to give three compounds ( 9,10 and 14 ) in yields of $3.8 \mathrm{mg}(47.5 \%), 1.3 \mathrm{mg}(15.1 \%)$ and $6.7 \mathrm{mg}(53.2 \%)$, respectively. 9 and 10 were completely identical with the above products derived from viniferifuran (1), respectively.

Acetylation of $(+)$-vitisin $A$. A solution of ( + )-vitisin A (5) ( $73.1 \mathrm{mg}, 80.7 \mu \mathrm{~mol}$ ) in acetic anhydride
$(1.0 \mathrm{ml})$ and pyridine ( 1.0 ml ) was stirred overnight at room temperature. After the concentration of the reaction mixture under reduced pressure, the residue was subjected to column chromatography over silica gel (Fuji silysia Chemical Co. Ltd., BW-820MH, 0.3 g ) using chloroform to give an acetate ( 15 ) in a yield of 103.5 mg ( $96.7 \%$ ).

Deacetylation of the dehydro product. A solution of the dehydro product ( $\mathbf{1 6}$ ) ( $15.2 \mathrm{mg}, 11.5 \mu \mathrm{~mol}$ ) and potassium hydroxide ( $109 \mathrm{mg}, 1.6 \mathrm{mmol}$ ) in methanol ( 15 ml ) was stirred at room temperature. After 1.5 hr , the solution was diluted with cooled water ( 15 ml ) and then neutralized with $1 \%$ cooled hydrochloric acid. The solution was extracted with ethyl acetate (each $20 \mathrm{ml}, 3$ times). The extract was washed with brine and then dried over sodium sulfate. After evaporation of the solvent, the residue was subjected to preparative TLC (Merck, $1.05715(0.25 \mathrm{~mm}, 20 \times 20 \mathrm{~cm}$ ), chloroform - methanol (4:1)) to give a product (2) in a yield of 6.2 mg $(59.7 \%)$. The product was completely identified with natural (+)-vitisifuran A (2) by comparison with the optical rotation as well as the ${ }^{1} \mathrm{H}$-NMR spectral data.

Methylation of $(-)$-vitisifuran B. A mixture of ( - --vitisifuran B(3) ( $14.8 \mathrm{mg}, 16.4 \mu \mathrm{~mol}$ ), methyl iodide ( $480 \mathrm{mg}, 3.4 \mathrm{mmol}$ ) and potassium carbonate ( $470 \mathrm{mg}, 3.4 \mathrm{mmol}$ ) in acetone ( 10 ml ) was stirred under nitrogen atmosphere at room temperature. After 22 hr , the reaction mixture was diluted by ethyl acetate ( 50 ml ), washed with brine and then dried over sodium sulfate. After evaporation of the solvent, the residue was subjected to preparative TLC [Merck, $1.05715(0.25 \mathrm{~mm}, 20 \times 20 \mathrm{~cm})$, chloroform] to give a nonamethyl derivative (17) in a yield of 13.8 mg ( $81.8 \%$ ).

Ozonolysis of nonamethyl (-)-vitisifuran B. A solution of nonamethyl-(-)-vitisifuran B (17) (11.0 mg, $10.7 \mu \mathrm{~mol}$ ) in ethyl acetate ( 7 ml ) was cooled at $-78^{\circ} \mathrm{C}$, treated with ozone for 1 min , and then worked up with dimethyl sulfide $(0.5 \mathrm{ml})$ to give a resulting mixture. The mixture was separated by preparative TLC (Merck $1.05715(0.25 \mathrm{~mm}, 20 \times 20 \mathrm{~cm})$, hexane - acetone (2:1)) to give three compounds ( 9,10 and 18 ) in yields of $1.5 \mathrm{mg}(33.6 \%), 1.1 \mathrm{mg}(22.9 \%)$ and $4.1 \mathrm{mg}(59.6 \%)$, respectively. 9 and 10 were completely identical with the above products derived from viniferifuran (1), respectively. 18 was also identified with an authentic sample derived from (-)-vitisin $B(6)$ including the sign of the optical rotation. ${ }^{6}$

Acetylation of (-)-vitisin B. A solution of (-)-vitisin B (6) ( $121.3 \mathrm{mg}, 133.9 \mu \mathrm{~mol})$ in acetic anhydride $(1.5 \mathrm{ml})$ and pyridine ( 1.5 ml ) was stirred overnight at room temperature. After the concentration of the reaction mixture under reduced pressure, the residue was subjected to column chromatography over silica gel (Fuji silysia Chemical Co. Lid., BW-820MH, 2 g ) using chloroform - methanol (10:1) to give an acetate (19) in a yield of 171.2 mg ( $99.6 \%$ ).

Deacetylation of compound 21. A solution of compound $21(6.2 \mathrm{mg}, 4.8 \mu \mathrm{~mol})$ and potassium hydroxide ( $112 \mathrm{mg}, 1.7 \mathrm{mmol}$ ) in methanol ( 10 ml ) was stirred at room temperature. After 1.5 hr , the solution was diluted with cooled water ( 10 ml ) and then neutralized with $1 \%$ cooled hydrochloric acid. The solution was extracted with ethyl acetate (each $20 \mathrm{ml}, 3$ times). The extract was washed with brine and then dried over sodium sulfate. After evaporation of the solvent, the residue was subjected to preparative TLC (Merck, 1.05715 ( 0.25 $\mathrm{mm}, 20 \times 20 \mathrm{~cm}$ ), chloroform - methanol ( $4: 1$ )) to give a product ( 3 ) in a yield of $2.8 \mathrm{mg}(64.0 \%)$. The product was completely identified with natural (-)-vitisifuran B (3) by comparison with the optical rotation as well as the ${ }^{1} \mathrm{H}$-NMR spectral data.

Oxidation of compound 20. A mixture of compound $20(5.0 \mathrm{mg}, 3.9 \mu \mathrm{~mol})$ and DDQ ( 1.5 mg ) in toluene ( 5 ml ) was stirred under reflux in a nitrogen atomosphere. Furthermore, each 1.5 mg of DDQ (totally 9.1 $\mathrm{mg}, 40.1 \mu \mathrm{~mol}, 10.3 \mathrm{eq}$ ) was added into the reaction mixture every 10 hr . After 62 hr , the reaction mixture was subjected to column chromatography over silica gel (Fuji silysia Chemical Co. Ltd., BW-820MH, 1.5 g ) using benzene - acetone ( $20: 1$ ) ) and then to preparative HPLC (YMC Co. Ltd., YMC-Pack C8 ( $\$ 20 \times 250 \mathrm{~mm}$ ),
acetonitrile - water ( $8: 2$ ), flow rate: $3.0 \mathrm{ml} / \mathrm{min}$ ) to give a dehydrogenated products ( 0.7 mg ) with the recovered starting material ( $\mathbf{2 0}, 3.0 \mathrm{mg}$ ). The product was completely identified with compound 22 by comparison with the IR and ${ }^{1} \mathrm{H}-\mathrm{NMR}$ spectral data.

Oxidation of compound 21. A mixture of compound $21(5.0 \mathrm{mg}, 3.9 \mu \mathrm{~mol})$ and DDQ ( 1.5 mg ) in toluene ( 5 ml ) was stirred under reflux in a nitrogen atomosphere. Furthermore, each 1.5 mg of DDQ (totally 9.2 $\mathrm{mg}, 40.5 \mu \mathrm{~mol}, 10.4 \mathrm{eq}$ ) was added into the reaction mixture every 10 hr . After 62 hr , the reaction mixture was subjected to column chromatography over silica gel (Fuji silysia Chemical Co. Ltd., BW-820MH, 1.5 g ) using benzene - acetone ( $20: 1$ ) and then to preparative HPLC (YMC Co. Ltd., YMC-Pack C8 ( $\phi 20 \times 250 \mathrm{~mm}$ ), acetonitrile - water ( $8: 2$ ), flow rate: $3.0 \mathrm{ml} / \mathrm{min}$ ) to give a dehydrogenated products $(0.3 \mathrm{mg})$ with the recovered starting material ( $21,3.3 \mathrm{mg}$ ). The product was completely identified with compound 22 by comparison with the IR and ${ }^{1} \mathrm{H}-\mathrm{NMR}$ spectral data.

Acknowledgments. This research was financially supported by Grants-in-Aid for Scientific Research (No. 09672174) and for High-Tech Research Center Project from the Ministry of Education, Science, Sports and Culture of Japan which are gratefully acknowledged. We also thank Mrs. F. Yamahata (Wakayama Prefecture) for collection of the plant material ('Kyohou'), Professor A. Nagatsu (Nagoya City University) for the CD spectra and Mr. K. Terashima (Meijo University) for the high resolution FAB-MS.

7. In the HMBC spectrum of 20 , cross peaks between $\mathrm{H}-14 \mathrm{c}$ and $\mathrm{C}-8 \mathrm{c}, \mathrm{H}-2 \mathrm{~b}$ and $\mathrm{C}-8 \mathrm{c}, \mathrm{H}-7 \mathrm{~d}$ and $\mathrm{C}-2 \mathrm{~d}$ ( 6 d ), and $\mathrm{H}-8 \mathrm{~d}$ and $\mathrm{C}-10 \mathrm{~d}$ (14d) were respectively observed.
8. In the HMBC spectrum of 21 , cross peaks between $\mathrm{H}-10 \mathrm{a}$ (14a) and $\mathrm{C}-8 \mathrm{a}, \mathrm{H}-2 \mathrm{a}$ (6a) and $\mathrm{C}-7 \mathrm{a}, \mathrm{H}-7 \mathrm{~d}$ and $\mathrm{C}-2 \mathrm{~d}$ ( 6 d ), and $\mathrm{H}-8 \mathrm{~d}$ and $\mathrm{C}-10 \mathrm{~d}$ (14d) were respectively observed.
9. In the HMBC spectrum of 22, cross peaks between $\mathrm{H}-7 \mathrm{~d}$ and $\mathrm{C}-2 \mathrm{~d}$ ( 6 d ), and $\mathrm{H}-8 \mathrm{~d}$ and $\mathrm{C}-10 \mathrm{~d}$ (14d) were respectively observed.
