#### Abstract

Treatment of the $\alpha, \beta$-unsaturated esters 1,6 and 8 with trialkylsilyl trifluoromethanesulfonate in the presence of a tertiary amine gave, via silyl dienol ethers, the corresponding deconjugated esters 3, 7 and 9 as the major products, respectively. Reaction of bis- $\alpha, \beta$-unsaturated esters 12a and 12 b with a trialkylsilyl trifluoromethansulfonate in the presence of a tertiary amine caused an intramolecular Michael reaction to produce the cyclopentanes 14a and 20a and the cyclohexanes 14b and 20b. Bicyclic compounds 21a and 21b formed by tandem Michael-Dieckmann or intramolecular Diels-Alder reaction were concurrently obtained. The cyclohexane derivative 14b was converted into the racemate of a sesquiterpene, ( $\pm$ )-ricciocarpin A 22.

#### Abstract

Formation of enolates and their selective reactions are among the most important processes in organic synthesis. ${ }^{1}$ Stereoselective aldol and Michael reactions have been developed utilizing several metal enolates, such as lithium, boron, aluminium, silicon, titanium, tin and zinc. Among them, silyl enolates are superior to other metal enolates in isolation, regioselective formation, and inherent reactivities under mild conditions. ${ }^{2}$ Trialkylsilyl trifluoromethanesulfonates are known as the most potent silylating agent, smoothly converting a wide range of ketones, diketones and esters directly into their silyl enol ethers or silyl ketene acetals. ${ }^{2,3}$ In the course of our studies of tandem reactions using trialkylsilyl trifluoromethanesulfonates, ${ }^{4-6}$ the ready formation of silyl dienol ethers from $\alpha, \beta$-unsaturated esters was observed. We here report the deconjugation of $\alpha, \beta$-unsaturated esters and an intramolecular Michael reaction of bis- $\alpha, \beta$-unsaturated esters based on the creation of the silyl dienol ethers together with an application of the method to a synthesis of a natural product. ${ }^{7}$

## Results and Discussion

Deconjugation Reaction of $\alpha, \beta$-Unsaturated Esters.-Treatment of the ( $E$ )-unsaturated ester 1 , which was prepared by benzoylation of methyl ( $E$ )-7-hydroxyhept-2-enoate, ${ }^{8}$ with an excess of tert-butyldimethylsilyl trifluoromethanesulfonate (TBDMSOTf) in the presence of triethylamine in dichloromethane at room temperature followed by work-up provided the deconjugated esters $\mathbf{3}$ as major products. It was revealed from $500 \mathrm{MHz}^{1} \mathrm{H}$ NMR spectrum that the deconjugated esters 3 were composed of two isomers in a 1:1.3 ratio. When the reaction mixture of 1 with TBDMSOTf and triethylamine was quenched with deuterium oxide, the $\alpha$-deuteriated esters 4 were obtained. The fact was supported by spectroscopic evidence: reduction of the integration of the resonance due to the $\alpha$ hydrogens in the $500 \mathrm{MHz}{ }^{1} \mathrm{H}$ NMR spectrum and the molecular ion peak observed at $m / z 263$. The result indicates a formation of the silyl dienol ether 2. The deconjugated ester 3 must be formed by a kinetic protonation of 2 (Scheme 1 ).

The deconjugation of $\alpha, \beta$-unsaturated esters was examined under various conditions and the results are shown in Table 1. The reaction proceeded in the presence of a tertiary amine such as triethylamine or diisopropylethylamine (Entries 1 and 2), but the use of 1,8-diazabicyclo[5.4.0]undec-7-ene (DBU),
pyridine and hexamethyldisilazane as a base did not give the deconjugated product 3 (Entries 3-5). Among the solvents tested, the silyl dienol ether 2 was quickly formed in dichloromethane (Entry 1) and dichloroethane (Entry 6). Considerable exchange of methyl group of the ester function with the tert-butyldimethylsilyl group was observed during the reaction in dichloroethane over 1 h (Entry 6). The reaction was sluggish in chloroform (Entry 7), carbon tetrachloride (Entry 8), tetrahydrofuran (THF) (Entry 9), benzene (Entry 11) and hexane (Entry 12), and in diethyl ether for 1 h , no deconjugation was detected (Entry 10).
Treatment of the ester 6 with both TBDMSOTf and triisopropylsilyl trifluoromethanesulfonate (TIPSOTf) in the presence of triethylamine produced mainly the deconjugated products 7 (Entries 13 and 14). The silyl dienol ether formed by the reaction with TIPSOTf was rather stable and the product was decomposed by the acetic acid (Entries 14 and 16). The deconjugated ester 9 was exclusively produced from the conjugated ester 8 although the yield was low (Entry 15). It was interesting that the formation of the deconjugated ester $\mathbf{1 1}$ from the conjugated ester 10 possessing a substituent at the $\gamma$ position was poor (Entry 16).

Intramolecular Michael Reaction of Bis- $\alpha, \beta$-unsaturated Esters.-The intramolecular Michael reaction provides a powerful tool for the construction of ring systems. ${ }^{9}$ The above observation about the facile formation of silyl dienol ethers from $\alpha, \beta$-unsaturated esters led us to investigate a novel intramolecular Michael reaction of bis $-\alpha, \beta$-unsaturated esters. The intramolecular conjugate addition of the bis- $\alpha, \beta$-unsaturated esters $\mathbf{1 2}$ to form the cyclic compound 14 would take place through the silyl dienol ethers 13 under the given reaction conditions (Scheme 2). It was further expected that the bicyclic compounds 15 would be assembled by the tandem MichaelDieckmann reaction ${ }^{10}$ or by the intramolecular Diels-Alder reaction of 13.
Two substrates 12a and 12b for the key reaction were effectively prepared starting from 2 -methylpropanal dimethylhydrazone. The reaction of the hydrazone with the alkyl bromides $16 \mathbf{a}^{11}$ and $\mathbf{1 6 b}$, in the presence of lithium diisopropylamide (LDA) proceeded through elimination ${ }^{12}$ to afford the nitriles 17a and 17b (Scheme 3). Reduction of the latter with diisobutylaluminium hydride (DIBALH), followed by treatment of the products with silica gel provided the

Scheme 2
aldehydes 18a and 18b. These reacted with trimethyl phosphonoacetate in the presence of sodium hydride to yield the ( $E$ )-unsaturated esters 19a and 19b. After deprotection of the acetal groups of 19a and 19b using pyridinium toluene-psulfonate (PPTS), condensation with methyl triphenylphosphoranylideneacetate in acetonitrile gave the required bis( $E, E$ )-unsaturated esters 12a and 12b.

The outcome of the reaction of the bis- $(E, E)$-unsaturated esters 12a and 12b with various trialkylsilyl trifluoromethanesulfonates in the presence of triethylamine in dichloromethane is summarised in Table 2. An inseparable mixture of the cyclopentane derivatives 14 a and 20a and cyclohexane derivatives 14b and 20b were obtained from 12a and 12b, respectively. The cyclopentane 14 a having the ( $E$ )-conjugated ester was obtained as a single stereoisomer, while two isomeric cyclohexanes 14b were obtained. It was later established by the equilibration of the aldehydes 24 derived from 14b that the major isomer was the trans-substituted cyclohexane and the minor was the $c i s$-substituted one. The ( $E$ )-structures of the deconjugated esters 20a and 20b were tentatively assigned, mainly on the basis of their thermodynamic stability. It was noteworthy that the bicyclic compounds 21a and 21b were obtained only by the reactions carried out with TBDMSOTf (Entries 1 and 3), although it is difficult to determine the precise mechanism: the tandem Michael-Dieckmann or the intramolecular cycloaddition process. The products 21a and 21b were each formed as a single stereoisomer. The stereostructure of 21a was uncertain, but the trans-fused structure of 21b was established by the coupling constants of the signal due to the angular 4a-H observed as a doublet, $J 12.8$ and 11.4 Hz .
On the other hand, it was observed that treatment of bis( $E, E$ )-unsaturated esters 12a and 12b with various bases did not effectively induce the desired intramolecular Michael reaction. Thus, compounds 14a and 14b were obtained in very poor yield by the reaction with a base such as LDA or sodium hydride.

co-workers synthesised the racemate of $22 .{ }^{15}$ Therefore, we were interested in the conversion of the above Michael product 14b into the natural product $\mathbf{2 2}$. The mixture of the cyclohexanes $\mathbf{1 4 b}$ and 20b, obtained by the above method (Entry 3) was subjected to ozonolysis to give the ketone 23 and the aldehydes 24, which were composed of two isomers in a 1.5:1 ratio. The ratio of two isomers of 24 was changed to $7.5: 1$ by their treatment with DBU in dichloromethane at room temperature. Reduction of the equilibrated products with sodium borohydride produced the cyclic hemiacetals 25 , which consisted of the trans- and cis-fused isomers in a $7.5: 1$ ratio. Since the coupling reaction of the hemiacetals 25 with 3 -furyllithium gave a poor result, they were transformed into the thioacetals 26 by the action of propane-1,3-dithiol in the presence of boron
trifluoride-diethyl ether. After the protection of the hydroxy group with the tert-butyldimethylsilyl group, deprotection of the thioacetal group of 27, followed by the reaction of the resulting aldehyde with 3 -furyllithium smoothly produced the epimeric mixture of the alcohols 28 . Removal of the protecting group of 28 provided a 1.3:1 mixture of the diols 29 . It was interesting that oxidation of the mixture of diols 29 with pyridinium dichromate (PDC) in dimethylformamide (DMF)

## Experimental

General Methods.-M.p.s were determined on a Yanako micromelting point apparatus and are uncorrected. IR spectra were recorded on a JASCO-IR-Report-100 spectrophotometer, with the sample prepared as a neat film or in chloroform solution. The assignable absorptions are reported. ${ }^{1} \mathrm{H}$ NMR spectra were recorded on the following instruments: Hitachi R-1200 ( 60 MHz ), Hitachi R-3000 ( 300 MHz ) and JEOL GX$500(500 \mathrm{MHz})$. Chemical shifts ( $\delta$ ) are measured relative to tetramethylsilane, using either $\mathrm{SiMe}_{4}$ or the solvent as internal reference. All $J$ values are given in Hz and only characteristic signals are recorded. The ratio of products was determined by integrations in the 500 MHz NMR spectra. Mass spectra were recorded on either a JEOL DX-300 or a JEOL DX-303 instrument. Ordinary chromatography was performed on Merck Kieselgel 60 Art 7734, while flash chromatography was carried out using Merck Kieselgel 60 Art 9385. HPLC was carried out with a Gilson HPLC system Model 320/303 and monitored by UV absorption and refractive-index measurements. All reactions were carried out under $\mathrm{N}_{2}$ or Ar atmospheres. Solvents were distilled prior to use: THF, $\mathrm{Et}_{2} \mathrm{O}$ and benzene were distilled from sodium-benzophenone, $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ and DME were distilled from $\mathrm{CaH}_{2}$ and stored over molecular sieves $4 \AA$. All extracts were dried over $\mathrm{MgSO}_{4}$ unless otherwise stated, and solvents were removed on a rotary evaporator at $30-40^{\circ} \mathrm{C}$. Oily NaH was washed with dry hexane three times prior to use. All new compounds described in this Experimental section were homogeneous on TLC and HPLC.

Methyl (E)-7-Benzoyloxyhept-2-enoate 1.-To a solution of methyl ( $E$ - -7-hydroxyhept-2-enoate ${ }^{8}(500 \mathrm{mg}, 3.16 \mathrm{mmol})$ in dry pyridine ( $10 \mathrm{~cm}^{3}$ ) was added benzoyl chloride $\left(1.5 \mathrm{~cm}^{3}, 12.9\right.$ mmol ) at $0^{\circ} \mathrm{C}$ and the mixture was stirred for 2.5 h at room temp. After addition of $\mathrm{MeOH}\left(1 \mathrm{~cm}^{3}\right)$, the mixture was stirred for 10 min at the same temperature and then diluted with benzene. The resulting mixture was washed with $10 \% \mathrm{HCl}$, saturated aq. $\mathrm{NaHCO}_{3}$ and brine, dried, and evaporated to give a residue which was subjected to chromatography on silica gel. Elution with hexane- $\operatorname{EtOAc}(9: 1 \mathrm{v} / \mathrm{v})$ afforded the methyl ester $1(785 \mathrm{mg}, 95 \%)$ as an oil; $v_{\text {max }}($ neat $) / \mathrm{cm}^{-1} 1720-1715(\mathrm{C}=\mathrm{O})$ and $1655(\mathrm{C}=\mathrm{C}) ; \delta_{\mathrm{H}}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 1.60-1.69(2 \mathrm{H}, \mathrm{m})$, $1.76-1.86(2 \mathrm{H}, \mathrm{m}), 2.29\left(2 \mathrm{H}, \mathrm{ddt}, J 7.3,7.3\right.$ and $\left.1.5, \mathrm{CH}_{2} \mathrm{CH}=\right)$, $3.73(3 \mathrm{H}, \mathrm{s}, \mathrm{OMe}), 4.33\left(2 \mathrm{H}, \mathrm{t}, J 6.4, \mathrm{CH}_{2} \mathrm{O}\right), 5.86(1 \mathrm{H}, \mathrm{dt}, J$ 15.3 and $\left.1.5, \mathrm{CHCO}_{2} \mathrm{Me}\right), 6.98(1 \mathrm{H}, \mathrm{dt}, J 15.3$ and 7.3 , $\left.\mathrm{CH}=\mathrm{CHCO}_{2} \mathrm{Me}\right), 7.39-7.47(3 \mathrm{H}, \mathrm{m}, 3 \times \mathrm{ArH})$ and $7.52-7.58$ ( $2 \mathrm{H}, \mathrm{m}, 2 \times \mathrm{ArH}$ ) $; m / z 262\left(\mathrm{M}^{+}\right)$.

Methyl (E)-8-tert-Butyldiphenylsiloxy-4-methyloct-2-enoate
10.-According to the reported procedure, ${ }^{5}$ 2-methyl- $\varepsilon$-caprolactone ( $200 \mathrm{mg}, 1.56 \mathrm{mmol}$ ) was reduced with DIBALH in hexane $\left(0.93 \mathrm{~mol} \mathrm{dm}{ }^{-3} ; 1.84 \mathrm{~cm}^{3}, 1.71 \mathrm{mmol}\right)$ to give the aldehyde, which was used in the following reaction without purification. A mixture of the aldehyde and methyl triphenylphosphoranylideneacetate ( $782 \mathrm{mg}, 2.34 \mathrm{mmol}$ ) in dry MeCN $\left(6 \mathrm{~cm}^{3}\right)$ was stirred for 16 h at room temp. and heated for 5 h at $60^{\circ} \mathrm{C}$. Evaporation of the solvent gave a residue, which was subjected to chromatography on silica gel. Elution with hexaneEtOAc (3:1 v/v) provided methyl 8-hydroxy-4-methyloct-2enoate ( $225 \mathrm{mg}, 77 \%$ overall yield) as a mixture of two $(E)$ - and $(Z)$-isomers; $v_{\max }($ neat $) / \mathrm{cm}^{-1} 3380(\mathrm{OH})$ and $1710(\mathrm{C}=\mathrm{O})$ and $1645(\mathrm{C}=\mathrm{C}) ; \delta_{\mathrm{H}}\left(60 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 1.05(3 \mathrm{H}, \mathrm{d}, J 6.6, \mathrm{CHMe})$,
