#### Abstract

A novel lead compound, $N$-\{3-[4-(4-fluorobenzoyl)piperidin-1-yl]propyl\}-1-methyl-5-oxo- $N$-phenylpyrroli-dine-3-carboxamide (1), was identified as a CCR5 antagonist by high-throughput screening using [ ${ }^{125}$ I]RANTES and CCR5-expressing CHO cells. The $\mathbf{I C}_{50}$ value of 1 was $1.9 \mu \mathrm{M}$. In an effort to improve the binding affinity of 1 , a series of 5-oxopyrrolidine-3-carboxamides was synthesized. Introduction of 3,4-dichloro substituents to the central phenyl ring ( $10 \mathrm{i}, \mathrm{IC}_{50}=0.057 \mu_{\mathrm{M}} ; 11 \mathrm{~b}, \mathrm{IC}_{50}=0.050 \mu_{\mathrm{M}}$ ) or replacing the 1-methyl group of the $\mathbf{5}$-oxopyrrolidine moiety with a 1-benzyl group ( $12 \mathrm{e}, \mathrm{IC}_{50}=0.038 \mu \mathrm{M}$ ) was found to be effective for improving CCR5 affinity. Compound 10i, 11b, and 12e also inhibited CCR5-using HIV-1 envelope-mediated membrane fusion with $\mathbf{I C}_{50}$ values of $0.44,0.19$, and $0.49 \mu_{\mathrm{m}}$, respectively.

Key words CCR5 antagonist; chemokine; human immunodeficiency virus type 1 (HIV-1); 5-oxopyrrolidine-3-carboxamide

The development of combination antiretroviral therapy with human immunodeficiency virus type 1 (HIV-1) reverse transcriptase inhibitors and protease inhibitors has provided a clinically effective method of suppressing viral load in HIV1 -infected individuals, and has resulted in dramatic reductions in HIV-associated morbidity and mortality. ${ }^{1)}$ However, no current therapies are curative, ${ }^{2,}$ and HIV-1 replicates again rapidly when treatment ceases. ${ }^{3)}$ The complexity of the dosing regimens and the toxicity of the current anti-HIV-1 therapy make it difficult to maintain patient compliance. ${ }^{4}$ In addition, resistance to the currently available drugs is increasing. ${ }^{5)}$ Therefore, there remains a need to identify new classes of agents with improved efficacy and less toxicity.

The process of HIV-1 entry into host cells is one of the attractive targets for inhibition of HIV-1 replication. ${ }^{6}$ Recent successful studies with enfuvirtide (T-20), a peptide inhibitor of gp41-mediated HIV-1 entry, have confirmed this process as a clinically relevant target. ${ }^{77}$ It has been reported that HIV1 strains that cause the initial infection predominantly utilize CC chemokine receptor 5 (CCR5) as a coreceptor. ${ }^{8)}$ CCR5using (R5) HIV-1 is isolated exclusively during the asymptomatic stage, which usually persists for 5 to 10 years. ${ }^{9}$ CCR5 is a member of the seven-transmembrane G protein-coupled receptor superfamily. ${ }^{10)}$ The natural ligands for CCR5 are the CC chemokines [regulated on activation, normal T cell expressed and secreted (RANTES), macrophage inflammatory protein $1 \alpha(\mathrm{MIP}-1 \alpha)$, and MIP- $1 \beta$ ], which have been reported to inhibit R5 HIV-1 infection in vitro. ${ }^{11)}$ Individuals homozygous for a defect in CCR5 expression have been identified as being highly resistant to HIV-1 infection, while this defect does not cause a significant health problem. ${ }^{12-14)}$ In addition, infected individuals heterozygous for the defective gene appear to exhibit delayed disease progression. ${ }^{15)}$ These observations suggest that appropriate, small-molecule CCR5 antagonists functioning as HIV-1 entry inhibitors could be promising anti-HIV-1 therapeutic agents.

Several research groups have reported structurally diverse CCR5 antagonists. ${ }^{16-22)}$ Our laboratories have previously described the discovery of TAK-779, an anilide derivative with
a quaternary ammonium moiety, as a small-molecule CCR5 antagonist. ${ }^{23,24)}$ Continued screening of Takeda compound libraries using [ ${ }^{125}$ I]RANTES and Chinese hamster ovary (CHO) cells expressing human CCR5 has now identified a novel lead compound, $N$-\{3-[4-(4-fluorobenzoyl)piperidin-1yl]propyl $\}$-1-methyl-5-oxo- $N$-phenylpyrrolidine-3-carboxamide (1), as a CCR5 antagonist (Fig. 1). In this paper, we describe the discovery of the lead compound and the subsequent optimization, focused on a series of 5-oxopyrrolidine-3-carboxamides, to obtain potent CCR5 antagonists which can inhibit the HIV-1 cell entry.

## Chemistry

Target compounds were prepared by two general methods as outlined in Charts 2 and 3. The first method (Chart 2) was utilized to investigate structure-activity relationships (SARs) of alkyl linker length (Fig. 1, C) and piperidine moiety modifications (Fig. 1, D). The starting carboxylic acid 2a was prepared by condensation of itaconic acid and methylamine (Chart 1). ${ }^{25)}$ Coupling of the carboxylic acid 2a with aniline using 1-[3-(dimethylamino)propyl]-3-ethylcarbodiimide hydrochloride (EDC) and 1-hydroxybenzotriazole (HOBt) gave anilide 3. Treatment of $\mathbf{3}$ with sodium hydride followed by the appropriate bromochloroalkane produced chlorides $\mathbf{4 a}$ c. The 2 -chloroethyl derivative $\mathbf{4 d}$ was prepared in a different manner as follows. $N$-Alkylation of the anilide 3 with ethyl bromoacetate followed by hydrolysis gave the carboxylic acid. The reduction of the mixed anhydride of the acid gave the alcohol, which on reaction with carbon tetrachloride and triphenylphosphine yielded $\mathbf{4 d}$. The obtained chlorides $\mathbf{4 a}$ d were coupled with a variety of amines in the presence of

1
Fig. 1. Lead Compound
potassium iodide and potassium carbonate to provide the target compounds 5a-i. Alternatively, compounds 7a-e were obtained by reductive amination of aldehyde 6 with amines using sodium triacetoxyborohydride. The aldehyde $\mathbf{6}$ was prepared from the anilide 3 by N -alkylation with 2-(2-bro-moethyl)-1,3-dioxolane followed by hydrolysis with hydrochloric acid. Benzoylpiperazine derivative 5j was prepared by hydrogenolysis of benzylpiperazine $\mathbf{5 i}$ followed by benzoylation.

In order to explore the effect of substitutions on the central

phenyl ring (Fig. 1, B) and 5-oxopyrrolidine moiety (Fig. 1, A), we investigated an alternate method starting from piperidines 8a,b (Chart 3). The piperidines 8a,b were treated with acrolein in the presence of a catalytic amount of 1,8-diazabicyclo[5.4.0]undec-7-ene (DBU) in tetrahydrofuran (THF) to afford $\beta$-aminoaldehydes in situ, ${ }^{26)}$ which were converted to amine derivatives $\mathbf{9 a}$ - $\mathbf{t}$ by reductive amination with various aryl or aralkyl amines using sodium triacetoxyborohydride. Coupling reactions of the amines $\mathbf{9 a}-\mathbf{q}, \mathbf{s}, \mathbf{t}$ with 5-oxopyrrolidine-3-carboxylic acids $\mathbf{2 a}-\mathbf{n}$ were carried out via the corresponding acid chlorides to afford the targets 10a-p, 11a, b, 12a-m, 15a, b. Compound 10q was prepared by the carbodiimide-mediated coupling of the amine $\mathbf{9 r}$ with the acid $\mathbf{2 a}$. The carboxylic acids $\mathbf{2 b}$ - $\mathbf{n}$ were prepared by literature methods ${ }^{25)}$ from the corresponding amines (Chart 1). Removal of the 2,4-dimethoxybenzyl group of compound $\mathbf{1 2 m}$ with trifluoroacetic acid (TFA) gave compound 13, which on $N$-alkylation led to compound $14 \mathbf{a}, \mathbf{b}$.

All compounds described were prepared and tested as racemates.

## Results and Discussion

The lead compound 1 was discovered by high-throughput screening of Takeda compound libraries using a binding assay based on [ ${ }^{125}$ I]RANTES and CHO cells expressing human CCR5. This compound was shown to have moderate affinity for CCR5 with an $\mathrm{IC}_{50}$ value of $1.9 \mu \mathrm{~m}$. Our initial goal was to improve the CCR5 binding affinity. The structural feature of the lead compound 1 is 5-oxopyrrolidine-3carboxamide moiety. Deletion of the entire 5-oxopyrrolidin-3-ylcarbonyl group, as in the intermediates 9 , resulted in complete loss of activity, suggesting that this moiety was required for interaction with CCR5. Therefore, our initial SAR studies were focused on a series of 5-oxopyrrolidine-3-carboxamides.

The lead compound 1 could be divided into four subunits (Fig. 1): 5-oxopyrrolidine substituent (A), central phenyl ring (B), alkyl linker (C), and piperidine moiety (D). We first modified the alkyl linker (C) length in order to optimize the spacing between the two halves of the molecule. As shown in Table 1, the lead compound $\mathbf{1}$ with a three-carbon chain showed the best activity. Shortening the chain of 1 to two carbons caused a marked decrease in potency (5c), while lengthening it led to a more gradual loss of affinity, compound $\mathbf{5 a}$ and $\mathbf{5 b}$ being $c a .2$ and 3 times less potent than $\mathbf{1}$, respectively.

With the SAR on the chain established, we then varied the piperidine moiety $(\mathrm{D})$ to investigate the role of the piperidine ring and the substituent at the 4 -position of the piperidine (Table 2). Replacement of the 4-fluorobenzoyl group in $\mathbf{1}$ with a 4-fluorobenzyl group showed a 6-fold enhancement in potency (11a, $\mathrm{IC}_{50}=0.31 \mu \mathrm{M}$ ), suggesting that the carbonyl group in the lead compound 1 was not necessary for CCR5 binding. The compound $\mathbf{5 h}\left(\mathrm{IC}_{50}=0.48 \mu \mathrm{M}\right)$ having a benzyl group also exhibited improved activity comparable to 11a. Removal of the benzyl group in $\mathbf{5 h}$ resulted in a large decrease in potency ( $\mathbf{5 d}$ ), indicating that the benzene ring was essential for potent CCR5 binding affinity. Decreasing the distance from the piperidine ring to the benzene ring (5e) resulted in a loss of potency, as did increasing the distance (7c). Constraint of the benzene ring by introduction of a double bond (7a) or a spiro structure (5g) did not improve activity. Substitution with other groups such as a phenoxy (7d) or benzyloxy (7e) provided no improvement in binding affinity. Replacement of the basic piperidine with a less basic piperazine failed to maintain activity ( $\mathbf{5 i}, \mathbf{j}$ ). Since the 4-benzylpiperidine derivatives $(\mathbf{5 h}, \mathbf{1 1 a})$ had an improved potency compared to the lead $\mathbf{1}$, this component was utilized for further exploration.

We next turned our attention to modification of the central phenyl ring (B) (Table 3). Introduction of a methyl group at the 3- or 4-position of the phenyl ring resulted in a 3- or 5fold improvement in the binding potency ( $\mathbf{1 0 b}, \mathbf{1 0 c}$ ), while the 2-methyl derivative 10 a showed lower potency than the unsubstituted compound $\mathbf{5 h}$. The activity of 4-tert-butyl compound $\mathbf{1 0 d}$ was better than $\mathbf{5 h}$. 3,4-Disubstitution as in indan-5-yl derivative $\mathbf{1 0 e}$ also increased affinity compared to 5h. When the electron-donating methoxy group was introduced at the 4-position of the phenyl ring (10f), 3-fold reduction in potency was observed. Substitution at the 4-position of the phenyl ring with electron-withdrawing groups such as trifluoromethyl ( $\mathbf{1 0 m}$ ) and cyano ( $\mathbf{1 0 p}$ ) also lowered potency.

Moving the trifluoromethyl group to the 3-position of the phenyl ring (101) restored binding potency comparable to that of $\mathbf{5 h}$, while the bis-trifluoromethyl derivative $\mathbf{1 0 n}$ showed lower potency. The 3 -cyano compound $\mathbf{1 0 0}$ was a poorer inhibitor, indicating that this moiety does not prefer polar substituents.

When a chlorine atom was introduced at the 4-position of the phenyl (10h), lower potency than the unsubstituted compound $\mathbf{5 h}$ was observed, but the 3 -chloro derivative 10 g exhibited 4 -fold improvement in the binding affinity over $\mathbf{5 h}$. Furthermore, the 3,4-dichlorinated derivative $\mathbf{1 0 i}$ was found to show 8 -fold enhancement in inhibitory effect compared to $\mathbf{5 h}$ with an $\mathrm{IC}_{50}$ value of $0.057 \mu \mathrm{~m}$. Fluorinated $\left(\mathrm{R}^{4}=\mathrm{F}\right)$ analogue of 10 i also showed good activity (11b, $\mathrm{IC}_{50}=$ $0.050 \mu \mathrm{~m})$. Replacement of the 3,4-dichloro group by 3-chloro-4-fluoro ( $\mathbf{1 0 j}$ ) or 3,4-difluoro ( $\mathbf{1 0 k}$ ) group decreased the activity. Extension of the phenyl ring by a methylene unit

was tolerated as seen with the benzyl derivative $\mathbf{1 0 q}$.
While studying the central phenyl fragment, we simultaneously investigated substitutions at the 1-position of the 5-oxopyrrolidine moiety (A) (Table 4). Removal of the 1-methyl group led to compound 13, which was equipotent with the 1methyl derivative $\mathbf{5 h}$. Replacing the methyl group by a butyl (12a) provided a 4 -fold increase in potency, and replacing by a 2,2,2-trifluoroethyl group (14a) showed a 6-fold improvement. These results led us to explore introduction of more bulky substituents to increase potency. The 1-benzyl derivative $\mathbf{1 2 e}\left(\mathrm{IC}_{50}=0.038 \mu_{\mathrm{M}}\right)$ showed $>10$-fold enhancement in potency, whereas the 1-phenyl derivative 12d exhibited comparable activity to the 1 -methyl derivative (5h). Extension of the benzyl as a phenylethyl ( $\mathbf{1 2} \mathbf{j}$ ) showed similar potency compared to phenyl (12d), indicating the benzyl substituent (12e) was optimal for CCR5 binding. Saturation of the benzene ring in 12e affording 12c resulted in a loss of potency, suggesting that the aromatic ring was necessary for potent activity.

Substitution on the benzyl group was then investigated. Introduction of a chlorine atom at the 2-position of the benzyl was found to be tolerated (12f), while 3- or 4-chloro derivatives $(\mathbf{1 2 g}, \mathbf{h})$ showed lower potency than the unsubstituted compound 12e. A similar trend was observed for methyl substituted analogues (12i, 14b). Replacement of the benzyl with a furan-2-ylmethyl ( $\mathbf{1 2 k}$ ) led to a moderate loss in binding, while the pyridin-4-ylmethyl analogue (121) resulted in 6 -fold reduction of activity.

The previously discussed SAR of substitutions on the central phenyl ring of the 1-methyl-5-oxopyrrolidine derivatives (Table 3) was then applied to the 1-benzyl analogues. In the case of the 1-benzyl-5-oxopyrrolidine derivatives, introduc-

Fig. 2. NOESY Correlations of $\mathbf{1 0 i}$
tion of 3-chloro (15a) or 3,4-dichloro (15b) substituents did not significantly change the activity.

On the basis of NMR analysis, we speculated about the required conformation of the 5-oxopyrrolidine-3-carboxamide derivatives for CCR5 binding. The synthesized compounds have a central $N, N$-disubstituted amide moiety as a structural feature. It has been known that $N$-methylanilides prefer the $E$ form in which the phenyl ring is trans to the amide oxygen. ${ }^{27,28)}$ In the $E$ form, the plane of the phenyl ring is almost perpendicular to the amide plane. The ${ }^{1} \mathrm{H}-\mathrm{NMR}$ analysis of the $N$-phenyl derivatives in this study revealed that most of the derivatives exist as an almost single rotameric form in solution at room temperature. The conformation of $\mathbf{1 0 i}$ (free base) was determined by a NOESY experiment in $\mathrm{CDCl}_{3}$ at 300 K (Fig. 2). H-a ( $\delta 3.04$ ) was found to correlate with H-b ( $\delta 7.30$ ) and H-c ( $\delta 7.02$ ) in the NOESY spectrum, whereas no cross peak was observed between $\mathrm{H}-\mathrm{a}$ and $\mathrm{H}-\mathrm{d}(\delta 3.69)$. These results suggested that $\mathbf{1 0 i}$ and probably other $N$-phenyl derivatives have an $E$ form in solution. The preference of the $E$ form in this series might contribute to the receptor binding.

Finally, the activities of selected compounds for inhibition of HIV-1 cell entry were examined by a HIV-1 envelope-mediated membrane fusion assay using R5 HIV-1 (JR-FL strain) envelope-expressing COS-7 cells and CCR5-expressing MOLT-4 cells. The most potent CCR5 antagonists 10i, 11b,
and 12e inhibited the membrane fusion with $\mathrm{IC}_{50}$ values of $0.44,0.19$, and $0.49 \mu_{\mathrm{M}}$, respectively. These results demonstrated that the 5-oxopyrrolidine-3-carboxamide derivatives could block R5 HIV-1 cell entry by preventing the binding of the R5 HIV-1 envelope to CCR5. The selectivity profile of compound 11b for other chemokine receptors was evaluated using a binding assay. The $\mathrm{IC}_{50}$ values for CCR1, CCR2, CCR4, and CCR7 were all greater than $3 \mu \mathrm{~m}$.

## Conclusion

We have succeeded in the identification of a novel lead compound as a small-molecule CCR5 antagonist through high-throughput screening. The original lead 1 inhibited the binding of [ ${ }^{125}$ I]RANTES to CCR5 with an $\mathrm{IC}_{50}$ value of $1.9 \mu \mathrm{M}$. Systematic modification of the lead $\mathbf{1}$, focused on a series of 5-oxopyrrolidine-3-carboxamides, resulted in the identification of compounds with improved binding affinity. The most potent CCR5 antagonists $\mathbf{1 0 i}\left(\mathrm{IC}_{50}=0.057 \mu \mathrm{~m}\right)$, 11b $\left(\mathrm{IC}_{50}=0.050 \mu \mathrm{M}\right)$, and 12e $\left(\mathrm{IC}_{50}=0.038 \mu_{\mathrm{M}}\right)$ inhibited HIV-1 envelope-mediated membrane fusion with $\mathrm{IC}_{50}$ values of $0.44,0.19$, and $0.49 \mu \mathrm{M}$, respectively. Further efforts directed toward additional improvement of potency will be reported in due course.

## Experimental

Reagents and solvents were used as obtained from commercial suppliers without further purification. Column chromatography was carried out on Merck silica gel 60 (230-400 mesh) or ICN basic alumina (activity III). The yields reported were not optimized. Melting points were determined on a Yanagimoto micro melting point apparatus and are uncorrected. ${ }^{1} \mathrm{H}-\mathrm{NMR}$ spectra were recorded on a Varian Gemini $200(200 \mathrm{MHz})$ spectrometer. Two-dimensional NOESY spectra were recorded on a Bruker DMX 600 $(600 \mathrm{MHz})$ spectrometer. Chemical shifts are given in ppm with tetramethylsilane (organic solvents) or 3-(trimethylsilyl)propionic-2,2,3,3- $d_{4}$ acid, sodium salt $\left(\mathrm{D}_{2} \mathrm{O}\right)$ as an internal standard, and coupling constants $(J)$ are given in hertz (Hz). Mass spectra were recorded using an LC/MS system consisting of a Hewlett-Packard 1100 HPLC instrument and a Waters ZMD mass detector (ESI positive). Compound purity was checked by elemental analysis or analytical HPLC. Elemental analyses were carried out by Takeda Analytical Laboratories Ltd. Analytical HPLC was performed on a Shimadzu LC-10A system using a Shiseido CAPCELL PAK C18 UG120 column $(2.0 \times 50 \mathrm{~mm}, 3 \mu \mathrm{M})$. Chromatographic conditions were as follows: mobile phases, $\mathrm{A}=0.1 \% \mathrm{TFA} / \mathrm{H}_{2} \mathrm{O}, \mathrm{B}=0.1 \% \mathrm{TFA} / \mathrm{MeCN}$; gradient ( $\mathrm{A} / \mathrm{B}$ ), $0 \mathrm{~min}(90 / 10), 4 \mathrm{~min}(5 / 95), 5.5 \mathrm{~min}(5 / 95), 5.51 \mathrm{~min}(90 / 10), 8 \mathrm{~min}(90 / 10)$; flow rate, $0.5 \mathrm{ml} / \mathrm{min}$; detection, UV 220 nm . Retention times $\left(t_{\mathrm{R}}\right)$ and purity (area percent) are reported.

N -(3-Chloropropyl)-1-methyl-5-oxo- N -phenylpyrrolidine-3-carboxamide (4a) To an ice-cooled stirred solution of $\mathbf{3}(2.00 \mathrm{~g}, 9.2 \mathrm{mmol})$ in DMF $(20 \mathrm{ml})$ was added $\mathrm{NaH}(60 \%$ in oil, $733 \mathrm{mg}, 18 \mathrm{mmol})$. After 1 h the mixture was treated with 1-bromo-3-chloropropane $(1.81 \mathrm{ml}, 18 \mathrm{mmol})$, stirred for 30 min , removed from the ice bath, and stirred for an additional 1 h . The mixture was diluted with water $(100 \mathrm{ml})$ and extracted with EtOAc $(3 \times 50 \mathrm{ml})$. The organic layer was dried $\left(\mathrm{MgSO}_{4}\right)$, filtered, and concentrated in vacuo. The residue was purified by column chromatography on silica gel (EtOAc/MeOH 1/0 to 9/1) to afford $\mathbf{4 a}(2.43 \mathrm{~g}$, yield $90 \%$ ) as a colorless oil. ${ }^{1} \mathrm{H}-\mathrm{NMR}\left(\mathrm{CDCl}_{3}\right) \delta 1.95-2.15(2 \mathrm{H}, \mathrm{m}), 2.24(1 \mathrm{H}, \mathrm{dd}, J=17.0,9.3 \mathrm{~Hz})$, $2.68(1 \mathrm{H}, \mathrm{dd}, J=17.0,8.5 \mathrm{~Hz}), 2.77(3 \mathrm{H}, \mathrm{s}), 2.95-3.25(1 \mathrm{H}, \mathrm{m}), 3.19(1 \mathrm{H}, \mathrm{t}$, $J=8.8 \mathrm{~Hz}), 3.56(2 \mathrm{H}, \mathrm{t}, J=6.6 \mathrm{~Hz}), 3.65(1 \mathrm{H}, \mathrm{dd}, J=8.8,7.0 \mathrm{~Hz}), 3.80-3.90$ $(2 \mathrm{H}, \mathrm{m}), 7.10-7.25(2 \mathrm{H}, \mathrm{m}), 7.35-7.55(3 \mathrm{H}, \mathrm{m})$.

The following compounds $\mathbf{4 b}, \mathbf{c}$ were prepared using a procedure similar to that described for $\mathbf{4 a}$ from the corresponding bromochloroalkanes.
$\boldsymbol{N}$-(4-Chlorobutyl)-1-methyl-5-oxo- N -phenylpyrrolidine-3-carboxamide (4b) Yield $96 \%$, oil. ${ }^{1} \mathrm{H}-\mathrm{NMR}\left(\mathrm{CDCl}_{3}\right) \delta 1.58-1.89(4 \mathrm{H}, \mathrm{m}), 2.23$ ( $1 \mathrm{H}, \mathrm{dd}, J=16.7,9.3 \mathrm{~Hz}$ ), $2.60-2.80(4 \mathrm{H}, \mathrm{m}), 2.97-3.25(2 \mathrm{H}, \mathrm{m}), 3.50-$ $3.81(5 \mathrm{H}, \mathrm{m}), 7.11-7.20(2 \mathrm{H}, \mathrm{m}), 7.36-7.53(3 \mathrm{H}, \mathrm{m})$.
$\mathbf{N}$-(5-Chloropentyl)-1-methyl-5-oxo- N -phenylpyrrolidine-3-carboxamide (4c) Yield $96 \%$, oil. ${ }^{1} \mathrm{H}-\mathrm{NMR}\left(\mathrm{CDCl}_{3}\right) \delta 1.35-1.87(6 \mathrm{H}, \mathrm{m}), 2.23$ ( $1 \mathrm{H}, \mathrm{dd}, J=16.3,9.3 \mathrm{~Hz}$ ), $2.60-2.80(4 \mathrm{H}, \mathrm{m}), 2.95-3.24(2 \mathrm{H}, \mathrm{m}), 3.52$ $(2 \mathrm{H}, \mathrm{t}, J=6.4 \mathrm{~Hz}), 3.59-3.77(3 \mathrm{H}, \mathrm{m}), 7.10-7.20(2 \mathrm{H}, \mathrm{m}), 7.38-7.53$ (3H, m).
$N$-(2-Chloroethyl)-1-methyl-5-oxo- $N$-phenylpyrrolidine-3-carboxamide (4d). Step 1: Ethyl 2-\{[(1-Methyl-5-oxopyrrolidin-3-yl)carbonyl]anilino\}acetate To an ice-cooled stirred solution of $\mathbf{3}(2.00 \mathrm{~g}, 9.2 \mathrm{mmol})$ in DMF ( 20 ml ) was added $\mathrm{NaH}(60 \%$ in oil, $916 \mathrm{mg}, 23 \mathrm{mmol})$. After 1 h the mixture was treated with ethyl bromoacetate ( $3.05 \mathrm{ml}, 28 \mathrm{mmol}$ ), stirred for 30 min , removed from the ice bath, and stirred for an additional 6 h . The mixture was poured into ice-cooled $0.5 \mathrm{~N} \mathrm{HCl}(100 \mathrm{ml})$ and extracted with EtOAc $(3 \times 50 \mathrm{ml})$. The organic layer was dried $\left(\mathrm{MgSO}_{4}\right)$, filtered, and concentrated in vacuo. The residue was purified by column chromatography on silica gel (EtOAc/MeOH $1 / 0$ to $95 / 5$ ) to afford the product $(2.43 \mathrm{~g}$, yield $87 \%)$ as a white solid, $\mathrm{mp} 72-74^{\circ} \mathrm{C} .{ }^{1} \mathrm{H}-\mathrm{NMR}\left(\mathrm{CDCl}_{3}\right) \delta 1.28(3 \mathrm{H}, \mathrm{t}$, $J=7.2 \mathrm{~Hz}), 2.28(1 \mathrm{H}, \mathrm{dd}, J=16.4,9.4 \mathrm{~Hz}), 2.75(1 \mathrm{H}, \mathrm{dd}, J=16.4,7.8 \mathrm{~Hz})$, $2.78(3 \mathrm{H}, \mathrm{s}), 3.10-3.35(2 \mathrm{H}, \mathrm{m}), 3.60-3.80(1 \mathrm{H}, \mathrm{m}), 4.22(2 \mathrm{H}, \mathrm{q}$, $J=7.2 \mathrm{~Hz}), 4.26(1 \mathrm{H}, \mathrm{d}, J=17.1 \mathrm{~Hz}), 4.45(1 \mathrm{H}, \mathrm{d}, J=17.1 \mathrm{~Hz}), 7.30-7.55$ ( $5 \mathrm{H}, \mathrm{m}$ ).

Step 2: 2-\{[(1-Methyl-5-oxopyrrolidin-3-yl)carbonyl]anilino\}acetic Acid To a stirred solution of the product from step $1(1.83 \mathrm{~g}, 6.0 \mathrm{mmol})$ in $\mathrm{MeOH}(20 \mathrm{ml})$ was added $8 \mathrm{~N} \mathrm{NaOH}(1.5 \mathrm{ml})$, and the mixture was stirred at room temperature for 10 h . The mixture was treated with $1 \mathrm{~N} \mathrm{HCl}(13 \mathrm{ml})$ and concentrated in vacuo. The residue was dissolved in EtOAc, dried $\left(\mathrm{MgSO}_{4}\right)$, filtered, and concentrated in vacuo to give the product $(1.54 \mathrm{~g}$, yield $93 \%)$. ${ }^{1} \mathrm{H}-\mathrm{NMR}\left(\mathrm{CDCl}_{3}\right) \delta 2.35(1 \mathrm{H}, \mathrm{dd}, J=17.0,9.0 \mathrm{~Hz}), 2.75-2.95$ $(1 \mathrm{H}, \mathrm{m}), 2.80(3 \mathrm{H}, \mathrm{s}), 3.10-3.35(2 \mathrm{H}, \mathrm{m}), 3.65-3.80(1 \mathrm{H}, \mathrm{m}), 4.31(1 \mathrm{H}, \mathrm{d}$, $J=17.4 \mathrm{~Hz}), 4.45(1 \mathrm{H}, \mathrm{d}, J=17.4 \mathrm{~Hz}), 7.30-7.55(5 \mathrm{H}, \mathrm{m})$.

Step 3: $\boldsymbol{N}$-(2-Hydroxyethyl)-1-methyl-5-oxo- $N$-phenylpyrrolidine-3carboxamide To a stirred solution of the product from step $2(829 \mathrm{mg}$, $3.0 \mathrm{mmol})$ and $\mathrm{Et}_{3} \mathrm{~N}(627 \mu \mathrm{l}, 4.5 \mathrm{mmol})$ in THF $(15 \mathrm{ml})$ at $-15^{\circ} \mathrm{C}$ was added ethyl chloroformate ( $430 \mu \mathrm{l}, 4.5 \mathrm{mmol}$ ), and the mixture was stirred at from -15 to $-10^{\circ} \mathrm{C}$ for 30 min . Then, a solution of $\mathrm{NaBH}_{4}(227 \mathrm{mg}, 6.0 \mathrm{mmol})$ in water $(1.5 \mathrm{ml})$ was added at $-10^{\circ} \mathrm{C}$, and the mixture was stirred at from
-10 to $0^{\circ} \mathrm{C}$ for 1 h . The mixture was treated with 1 N HCl at $0^{\circ} \mathrm{C}$, and the organic solvent was removed in vacuo. The residue was extracted with DCM, and the organic layer was dried $\left(\mathrm{MgSO}_{4}\right)$, filtered, and concentrated in vacuo. The residue was purified by column chromatography on silica gel ( $\mathrm{EtOAc} / \mathrm{MeOH} 1 / 0$ to $95 / 5$ ) to afford the product ( 662 mg , yield $84 \%$ ) as a colorless oil. ${ }^{1} \mathrm{H}-\mathrm{NMR}\left(\mathrm{CDCl}_{3}\right) \delta 2.27(1 \mathrm{H}, \mathrm{dd}, J=16.9,9.5 \mathrm{~Hz}), 2.71(1 \mathrm{H}$, dd, $J=16.9,8.4 \mathrm{~Hz}), 2.78(3 \mathrm{H}, \mathrm{s}), 3.00-3.25(1 \mathrm{H}, \mathrm{m}), 3.22(1 \mathrm{H}, \mathrm{t}$, $J=8.9 \mathrm{~Hz}), 3.66(1 \mathrm{H}, \mathrm{dd}, J=8.9,6.6 \mathrm{~Hz}), 3.70-4.10(4 \mathrm{H}, \mathrm{m}), 7.15-7.30$ $(2 \mathrm{H}, \mathrm{m}), 7.30-7.55(3 \mathrm{H}, \mathrm{m})$.
Step 4: $N$-(2-Chloroethyl)- $N$-phenyl-1-methyl-5-oxo-3-pyrrolidinecarboxamide (4d) A mixture of the product from step 3 ( $659 \mathrm{mg}, 2.5 \mathrm{mmol}$ ), triphenylphosphine ( $857 \mathrm{mg}, 3.3 \mathrm{mmol}$ ), and carbon tetrachloride ( 10 ml ) was stirred at reflux for 1 h . After cooling, the insoluble materials were removed by filtration. The filtrate was concentrated in vacuo, and the residue was purified by column chromatography on silica gel ( $\mathrm{EtOAc} / \mathrm{MeOH} 1 / 0$ to $95 / 5$ ) to give an oil which solidified. The solid was triturated with $\mathrm{Et}_{2} \mathrm{O}$ and filtered to afford $\mathbf{4 d}(366 \mathrm{mg}$, yield $52 \%)$ as a slightly brown solid, which was used immediately in the subsequent reaction. ${ }^{1} \mathrm{H}-\mathrm{NMR}\left(\mathrm{CDCl}_{3}\right) \delta 2.25$ $(1 \mathrm{H}, \mathrm{dd}, J=16.9,9.3 \mathrm{~Hz}), 2.70(1 \mathrm{H}, \mathrm{dd}, J=16.9,8.2 \mathrm{~Hz}), 2.78(3 \mathrm{H}, \mathrm{s})$, $2.95-3.25(1 \mathrm{H}, \mathrm{m}), 3.21(1 \mathrm{H}, \mathrm{t}, J=8.9 \mathrm{~Hz}), 3.55-3.75(3 \mathrm{H}, \mathrm{m}), 4.00(1 \mathrm{H}$, $\mathrm{dt}, J=13.9,6.2 \mathrm{~Hz}), 4.11(1 \mathrm{H}, \mathrm{dt}, J=13.9,6.6 \mathrm{~Hz}), 7.20-7.30(2 \mathrm{H}, \mathrm{m})$, $7.35-7.55(3 \mathrm{H}, \mathrm{m})$.
$N$-[3-(4-Benzylpiperidin-1-yl)propyl]-1-methyl-5-oxo- $N$-phenylpyrro-lidine-3-carboxamide Hydrochloride (5h) A mixture of $\mathbf{4 a}$ ( 400 mg , 1.4 mmol ), 4-benzylpiperidine ( $239 \mu \mathrm{l}, 1.4 \mathrm{mmol}$ ), KI ( $225 \mathrm{mg}, 1.4 \mathrm{mmol}$ ), $\mathrm{K}_{2} \mathrm{CO}_{3}(282 \mathrm{mg}, 2.0 \mathrm{mmol})$ in $\mathrm{MeCN}(20 \mathrm{ml})$ was stirred at reflux for 24 h . The mixture was concentrated in vacuo, diluted with water ( 15 ml ), and extracted with EtOAc $(3 \times 30 \mathrm{ml})$. The organic layer was dried $\left(\mathrm{MgSO}_{4}\right)$, filtered, and concentrated in vacuo. The residue was purified by column chromatography on silica gel (EtOAc/MeOH $1 / 0$ to $9 / 1$ ) to afford an oil $(344 \mathrm{mg})$. The oil was dissolved in $\mathrm{Et}_{2} \mathrm{O}$ and treated with $1 \mathrm{~N} \mathrm{HCl}\left(\mathrm{Et}_{2} \mathrm{O}\right.$ solution, 2 ml ). The resulting precipitate was filtrated, washed with $\mathrm{Et}_{2} \mathrm{O}$, and dried in vacuo over KOH to give $\mathbf{5 h}(282 \mathrm{mg}$, yield $44 \%)$ as an amorphous solid. ${ }^{1} \mathrm{H}-\mathrm{NMR}\left(\mathrm{D}_{2} \mathrm{O}\right) \delta 1.35-1.65(2 \mathrm{H}, \mathrm{m}), 1.75-2.10(5 \mathrm{H}, \mathrm{m}), 2.45(1 \mathrm{H}$, $\mathrm{dd}, J=17.7,8.7 \mathrm{~Hz}), 2.55-2.75(1 \mathrm{H}, \mathrm{m}), 2.63(2 \mathrm{H}, \mathrm{d}, J=6.8 \mathrm{~Hz}), 2.77(3 \mathrm{H}$, s), $2.80-3.00(2 \mathrm{H}, \mathrm{m}), 3.00-3.70(7 \mathrm{H}, \mathrm{m}), 3.75-3.90(2 \mathrm{H}, \mathrm{m}), 7.20-$ $7.45(7 \mathrm{H}, \mathrm{m})$, $7.45-7.65(3 \mathrm{H}, \mathrm{m})$. Anal. $N$-[3-(4-Benzylpiperidin-1-yl)propyl]-1-methyl- $N$-(4-methylphenyl)-5-oxopyrrolidine-3-carboxamide Hydrochloride (10c) To an ice-cooled stirred solution of $\mathbf{2 a}(358 \mathrm{mg}, 2.5 \mathrm{mmol})$ and DMF ( $23 \mu 1,0.3 \mathrm{mmol}$ ) in DCM $(10 \mathrm{ml})$ was added oxalyl chloride $(256 \mu \mathrm{l}, 3.0 \mathrm{mmol})$, and the mixture was stirred at $0^{\circ} \mathrm{C}$ for 15 min . The mixture was removed from the ice bath and stirred for an additional 1 h . The mixture was added dropwise to a stirred solution of $9 \mathbf{d}(395 \mathrm{mg}, 1.0 \mathrm{mmol})$ and $\mathrm{Et}_{3} \mathrm{~N}(1.39 \mathrm{ml}, 10 \mathrm{mmol})$ in $\mathrm{DCM}(15 \mathrm{ml})$ at $-20^{\circ} \mathrm{C}$. The resulting mixture was allowed to warm to $0^{\circ} \mathrm{C}$ and stirred for 1 h before being quenched with saturated aqueous $\mathrm{NaHCO}_{3}$ $(15 \mathrm{ml})$. The organic solvent was removed in vacuo, and the residue was extracted with EtOAc $(3 \times 15 \mathrm{ml})$. The organic layer was washed with saturated aqueous $\mathrm{NaHCO}_{3}(3 \times 5 \mathrm{ml})$ and brine $(5 \mathrm{ml})$, dried $\left(\mathrm{MgSO}_{4}\right)$, filtered, and concentrated in vacuo. The residue was purified by column chromatography on silica gel ( $\mathrm{EtOAc} / \mathrm{MeOH} 1 / 0$ to $9 / 1$ ) to afford the free base ( 442 mg ) as an oil. The oil was dissolved in MeOH and treated with $1 \mathrm{~N} \mathrm{HCl}\left(\mathrm{Et}_{2} \mathrm{O}\right.$ solution, 2 ml ). The solution was concentrated in vacuo to give a foam, which was triturated with $\mathrm{Et}_{2} \mathrm{O}$, filtered, and dried in vacuo over KOH yielding $\mathbf{1 0 c}$ ( 409 mg , yield $85 \%$ ) as an amorphous solid. ${ }^{1} \mathrm{H}-\mathrm{NMR}$ (DMSO- $d_{6}$ ) $\delta 1.30-$ $1.95(7 \mathrm{H}, \mathrm{m}), 2.11(1 \mathrm{H}, \mathrm{dd}, J=16.5,9.9 \mathrm{~Hz}), 2.30-2.60(3 \mathrm{H}, \mathrm{m}), 2.35(3 \mathrm{H}$, s), $2.60-3.50(9 \mathrm{H}, \mathrm{m}), 2.63(3 \mathrm{H}, \mathrm{s}), 3.50-3.75(2 \mathrm{H}, \mathrm{m}), 7.10-7.40(9 \mathrm{H}$, m). MS $m / z: 524\left(\mathrm{MH}^{+}\right)$. HPLC $t_{\mathrm{R}} 3.53 \mathrm{~min}$ ( $99 \%$ ).

The following compounds $\mathbf{1 5 a}, \mathbf{b}$ were prepared using a procedure similar to that described for $\mathbf{1 0} \mathbf{c}$ from the acid $\mathbf{2 f}$ and the anilines $\mathbf{9 h}, \mathbf{j}$.

1-Benzyl- $N$-[3-(4-benzylpiperidin-1-yl)propyl]- N -(3-chlorophenyl)-5-oxopyrrolidine-3-carboxamide (15a) Yield $39 \%$, oil. ${ }^{1} \mathrm{H}-\mathrm{NMR}\left(\mathrm{CDCl}_{3}\right) \delta$ $1.10-1.30(2 \mathrm{H}, \mathrm{m}), 1.30-1.85(7 \mathrm{H}, \mathrm{m}), 2.23-2.38(3 \mathrm{H}, \mathrm{m}), 2.50(2 \mathrm{H}, \mathrm{d}$, $J=6.6 \mathrm{~Hz}), 2.68-2.85(3 \mathrm{H}, \mathrm{m}), 2.96-3.13(2 \mathrm{H}, \mathrm{m}), 3.48-3.70(3 \mathrm{H}, \mathrm{m})$, $4.48(2 \mathrm{H}, \mathrm{s}), 7.08-7.60(14 \mathrm{H}, \mathrm{m})$. Anal. Calcd for $\mathrm{C}_{33} \mathrm{H}_{38} \mathrm{ClN}_{3} \mathrm{O}_{2} \cdot 0.6 \mathrm{H}_{2} \mathrm{O}$ : C, 71.42; H, 7.12; N, 7.57. Found: C, 71.36; H, 7.20; N, 7.51.

1-Benzyl- $N$-[3-(4-benzylpiperidin-1-yl)propyl]- $N$-(3,4-dichlorophenyl)-5-oxopyrrolidine-3-carboxamide (15b) Yield 58\%, oil. ${ }^{1} \mathrm{H}-\mathrm{NMR}\left(\mathrm{CDCl}_{3}\right)$ $\delta 1.10-1.38(2 \mathrm{H}, \mathrm{m}), 1.38-1.86(7 \mathrm{H}, \mathrm{m}), 2.22-2.40(3 \mathrm{H}, \mathrm{m}), 2.50(2 \mathrm{H}$, d, $J=6.6 \mathrm{~Hz}), 2.66-2.82(3 \mathrm{H}, \mathrm{m}), 2.90-3.15(2 \mathrm{H}, \mathrm{m}), 3.45-3.70(3 \mathrm{H}, \mathrm{m})$, $4.34(1 \mathrm{H}, \mathrm{d}, J=14.8 \mathrm{~Hz}), 4.46(1 \mathrm{H}, \mathrm{d}, J=14.8 \mathrm{~Hz}), 6.97(1 \mathrm{H}, \mathrm{dd}, J=8.6$, $2.6 \mathrm{~Hz}), 7.10-7.40(11 \mathrm{H}, \mathrm{m}), 7.49(1 \mathrm{H}, \mathrm{d}, J=8.6 \mathrm{~Hz})$. Anal. Calcd for $\mathrm{C}_{33} \mathrm{H}_{37} \mathrm{Cl}_{2} \mathrm{~N}_{3} \mathrm{O}_{2}$ : C, 68.51; H, 6.45; N, 7.26. Found: C, $68.36 ; \mathrm{H}, 6.49 ; \mathrm{N}$, 7.23.

Receptor Binding Assays CHO-K1 and CCR5-expressing CHO cells ${ }^{23)}$ were incubated with various concentrations of test compound in the binding buffer (Ham's F-12 medium containing 20 mm HEPES and $0.5 \%$ bovine serum albumin, pH 7.2 ) containing $200 \mathrm{pm}\left[{ }^{125} \mathrm{I}\right]$ RANTES. Binding reactions were performed at room temperature for 40 min . The binding reaction was terminated by washing out the free ligand with cold phosphate-buffered saline, and the cell-associated radioactivity was counted by TopCount scintillation counter (Packard). Binding assays for other chemokine receptors were carried out in a similar manner using the following ligands: CCR1 (RANTES), CCR2 (monocyte chemoattractant protein 1), CCR4 (thymusand activation-regulated chemokine), and CCR7 (MIP-3 $\beta$ ).

HIV-1 Envelope-mediated Membrane Fusion Assay COS-7 cells were maintained in Dulbecco's modified Eagle medium (D-MEM) supplemented with $10 \%$ FBS, $100 \mathrm{U} / \mathrm{ml}$ penicillin, and $100 \mu \mathrm{~g} / \mathrm{ml}$ streptomycin. MOLT-4/CCR5/Luc ${ }^{+}$cells, a lymphoblastoid cell line that expresses human CCR5 and that has an integrated copy of the HIV-1 long terminal repeat-driven luciferase reporter gene, were maintained in RPMI 1640 medium supplemented with $10 \%$ FBS, $100 \mathrm{U} / \mathrm{ml}$ penicillin, $100 \mu \mathrm{~g} / \mathrm{ml}$ streptomycin, and $500 \mu \mathrm{~g} / \mathrm{ml}$ geneticin. Tat, rev, and envelope cDNA were amplified from total RNA of R5 HIV-1 (JR-FL)-infected cells and cloned into an expression vector for mammalian cells. Those expression vectors were mixed with at a ratio of $3: 1: 5$ and co-transfected into COS-7 cells using Lipofectamine 2000 (Invitrogen). After 2 d incubation, transfected COS-7 cells and MOLT$4 / \mathrm{CCR} 5 / \mathrm{Luc}^{+}$cells were seeded in a 96 -well plate at $10^{4}$ cells each per well,
and various concentrations of the test compounds were added to the wells. The cell suspension was incubated at $37^{\circ} \mathrm{C}$. The mixture of D-MEM and RPMI 1640 medium supplemented with $10 \%$ FBS, $100 \mathrm{U} / \mathrm{ml}$ penicillin, and $100 \mu \mathrm{~g} / \mathrm{ml}$ streptomycin was used as medium for membrane fusion. After an overnight incubation, Luc-Screen (Tropix) was added to each well, and the mixtures were incubated at room temperature for 10 min . The luciferase activity was measured with a luminometer (Wallac 1420 ARVOsx).

Acknowledgments We would like to thank Mr. Kenichi Kuroshima for CCR5 binding assay; Mr. Katsunori Takashima, Dr. Hiroshi Miyake, and Ms. Shikiko Shiki for membrane fusion assay; and Ms. Mika Murabayashi for two-dimensional NMR measurement.
