#### Abstract

Phenyl-2-aza-3-trimethylsilyloxy-1,3-butadiene reacts with aliphatic, aromatic and cyclic ketones to give in good to excellent yields 6,6 -disubstituted-1,3-perhydro-oxazin-4-ones which, in turn, have been readily converted into $\beta$-hydroxy carboxylic acids.

Key words: Diels-Alder reactions, carboxylic acids, heterocycles, azo compounds

The hetero Diels-Alder reaction using carbonyl compounds as dienophiles is a very useful method to construct heterocyclic rings and is widely used as a key step in the synthesis of natural products. ${ }^{1}$
In conjunction with our current efforts on the use of 2-aza3 -silyloxy-1,3-dienes, ${ }^{2}$ derived from $N$-trialkylsilylimines ${ }^{3}$ and acyl chloride (Scheme 1), as useful tools in organic synthesis for the preparation of nitrogen containing heterocycles, we have demonstrated the utility of a stable 2-aza-3-trialkylsilyloxy-1,3-butadiene in selectively generating cis-, ${ }^{4}$ trans- $\beta$-lactams, ${ }^{5}$ 5-amido-perhy-dro-oxazinones, precursors of $\alpha$-amino- $\beta$-hydroxy acids ${ }^{6}$ and tetramic acids analogues. ${ }^{7}$
In this paper we report our preliminary results on the synthesis of 6,6 -disubstituted perhydro-oxazinones using the same approach.

Reagents and Conditions: $i$ : $\mathrm{NEt}_{3}$, heptane: ii: $\mathrm{BF}_{3}, \mathrm{Et}_{2} \mathrm{O},-78^{\circ} \mathrm{C}$, $\mathrm{CH}_{2} \mathrm{Cl}_{2}$.
Scheme 1

Treatment of the intermediate 3 (Scheme 1), obtained from N -trimethylsilylbenzaldimine $\mathbf{1}$ and acetyl chloride 2, with ketones $4 \mathbf{a}-\mathbf{i}$ in the presence of $\mathrm{BF}_{3}$ etherate in dichloromethane at $-78^{\circ} \mathrm{C}$ for 3 h , followed by stirring overnight at r.t., afforded the corresponding 6,6 -disubsti-tuted-tetrahydro-1,3-oxazin-4-ones 5a-i and $\mathbf{6 b}$-f in yields ranging from 45 to $90 \%$ (Table 1). ${ }^{8,9}$ No reaction occurred
on mixing the azadiene $\mathbf{3}$ with ketone $\mathbf{4 a}$ in dichloromethane at room temperature. This new strategy allows the preparation of perhydro-oxazinones and their transformation into an important class of biologically interesting compounds: the 3,3-disubstituted- $\beta$-hydroxy acids. ${ }^{10}$ As a matter of fact, elaboration of the diastereomeric mixture of the perhydro-oxazinones $\mathbf{5 a}$-i and $\mathbf{6 b}$-f into Boc derivatives $\mathbf{7 a}$-i and 8b-f (di-t-butylpyrocarbonate, TEA, $\mathrm{DMAP}_{\mathrm{cat}}$ ) and treatment of such compounds with LiOH in $\mathrm{EtOH} / \mathrm{H}_{2} \mathrm{O}$ solution, afforded the $\beta$-hydroxy-acids $9 \mathrm{a}-\mathrm{i}$ in almost quantitative yields as a racemic mixture (Scheme 2). ${ }^{11,9}$

Reagents and Conditions. $i$ : $\mathrm{O}\left[\mathrm{CO}_{2} \mathrm{C}\left(\mathrm{CH}_{3}\right)_{3}\right]_{2}, \mathrm{NEt}_{3}$, $\mathrm{DMAP}_{\mathrm{cat}}, \mathrm{CH}_{2} \mathrm{Cl}_{2}$; ii : $\mathrm{LiOH}, \mathrm{EtOH} / \mathrm{H}_{2} \mathrm{O}$.
Scheme 2

Reagents and Conditions: $i$ : $\mathrm{NEt}_{3}$, heptane: ii: $\mathrm{BF}_{3}, \mathrm{Et}_{2} \mathrm{O},-78^{\circ} \mathrm{C}$, $\mathrm{CH}_{2} \mathrm{Cl}_{2}$.
11a/12a: $\mathrm{R}=\mathrm{R}^{1}=\mathrm{CH}_{3}$ : Diastereomeric ratio 48/52; $53 \%$ yield
11b/12b: R-R ${ }^{1}=$ Cyclohexyl: Diastereomeric ratio 50/50; 63\% yield 11c: $\mathrm{R}=\mathrm{Me} ; \mathrm{R}^{1}=\mathrm{Ph}$ : Inseparable mixture of stereoisomers; $40 \%$ yield

Scheme 3

Table 1 3,3-Disubstituted-3-hydroxy-acids from 1-phenyl- 2-aza-3-trimethylsilyloxy-1,3-butadiene

Reagents and Conditions: $i$ : $\mathrm{BF}_{3}\left(\mathrm{Et}_{2} \mathrm{O},-78^{\circ} \mathrm{C}, \mathrm{CH}_{2} \mathrm{Cl}_{2}\right.$ (Overall yield $54 \%$; Ratio 14a/14b=91/9); ii: $\mathrm{O}\left[\mathrm{CO}_{2} \mathrm{C}\left(\mathrm{CH}_{3}\right)_{3}\right]_{2}, \mathrm{NEt}_{3}, \mathrm{DMAP}_{\text {cat }}$, $\mathrm{CH}_{2} \mathrm{Cl}_{2}$; iiii: $\mathrm{LiOH}, \mathrm{EtOH} / \mathrm{H}_{2} \mathrm{O}$.
Scheme 4

The possibility of preparing, by this route, optically pure $\beta$-hydroxy perhydro-oxazinones and, therefore, $\beta$-hydroxy acids has been tested using optically pure starting material as diene or dienophile. Preliminary results obtained using the homochiral azadiene 10, derived from ( $S$ )-triisopropylsilyloxy- $N$-trimethylsilylimine 1a and acetyl chloride, have not shown any appreciable diastereoselectivity (Scheme 3 ) since the corresponding 1/1 diastereomeric mixtures of 1,3-oxazine-4-ones 11a-b and 12a-b have been obtained.

In contrast the use of the optically pure (-)-menthone $\mathbf{1 3}$ as dienophile achieved a very high diastereoselectivity (Scheme 4). ${ }^{12}$ The perhydro-oxazinones $\mathbf{1 4 a}$ and $\mathbf{1 4 b}$ thus obtained have been converted into optically pure $\beta$-hy-droxy-acids 16a and 16b (Scheme 4).
Work is in progress in this vein as well as on the use of chiral catalysts, targeting the synthesis of optically pure 3,3-disubstituted-3-hydroxy acids.

(8) Synthesis of Perhydro-oxazin-4-ones: General procedure To a solution of LiHMDSA ( 1 ml of 1 M solution in THF) at $0^{\circ} \mathrm{C}$ benzaldehyde or (S)-triisopropylsilyloxy lactaldehyde ( 1 mmol ) in heptane ( 5 ml ) was added. The reaction mixture was allowed to reach r.t. spontaneously while the stirring was continued for 1 h . $\mathrm{TMSCl}(1.1 \mathrm{mmol})$ was added in one portion at $0^{\circ} \mathrm{C}$ and the reaction mixture further stirred for 1 h . A white precipitate formed. The solution was cooled at $0^{\circ} \mathrm{C}$ and $\mathrm{NEt}_{3}$ ( 2 mmol ) was added in one portion. The acetyl chloride 3 (1 mmol ) was added dropwise. Stirring was maintained for $1 / 2 \mathrm{~h}$ at $0^{\circ} \mathrm{C}$ and $1 / 2 \mathrm{~h}$ at r.t. while a new copious precipitate appeared. The precipitate was filtered under argon, the solvent removed in vacuo and to the resulting oily residue $\mathrm{CH}_{2} \mathrm{Cl}_{2}(10$ ml ) was added and the solution cooled at $-78^{\circ} \mathrm{C}$. Ketone 4 in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(2 \mathrm{ml})$ was added followed by $\mathrm{BF}_{3} \mathrm{Et}_{2} \mathrm{O}(1.1 \mathrm{mmol})$ in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(5 \mathrm{ml})$. The solution was stirred overnight while the temperature was allowed to reach r.t.. The mixture was poured into $5 \% \mathrm{NaHCO}_{3}$ aqueous solution and extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ . The organic layers were dried and the solvent removed in vacuo. Flash chromatography of the residue $\left(\mathrm{CH}_{2} \mathrm{Cl}_{2}\right.$ /acetone 9/1) yielded pure isolated perhydro-oxazin-4-ones.
(9) All compounds, identified as pure isolated compound, gave analytical data (I.R., ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR, MS and E.A.) consistent with the assigned structures and literature data. The configuration of each isomer has been determined by means of NOE experiments. (11) Synthesis of N-Boc-Perhydro-oxazin-4-ones. General procedure: Perhydro-oxazinone ( 1 mmol ) was dissolved in anhydrous $\mathrm{CH}_{2} \mathrm{Cl}_{2}(10 \mathrm{ml}), \mathrm{NEt}_{3}(1 \mathrm{mmol})$, DMAP (cat) and di-tert-butyldicarbonate were added. The mixture was stirred at r.t. (3h), the solvent was removed in vacuo and the residue filtered on a short silica gel column.
Synthesis of 3,3-dialkyl- $\beta$-hydroxy acids. General
Procedure: $N$-Boc derivative of perhydro-oxazinone (1
mmol ) was dissolved in a $1 / 1$ solution of $\mathrm{EtOH} / \mathrm{H}_{2} \mathrm{O} . \mathrm{LiOH}(5$ mmol ) was added and the mixture stirred at r.t. until t.l.c. spot test showed the disappearance of the starting material ( 3 hrs ) The solution was concentrated at half the starting volume, the crude mixture was extracted with ethyl acetate and the aqueous layers made acidic by HCl 1 N . Work-up by ethyl acetate and removal of the solvent yielded the $\beta$-hydroxy acid in almost quantitative yields. Any attempt to hydrolyze the unprotected perydro-oxazinone, so far, failed.
(12) The reported structures have been determined by NOE experiments irradiating the methyl group.
