#### Abstract

The species $\left[(\mathrm{Cp} * \mathrm{Cr})_{2}(\mu-\mathrm{Cl})_{3}\right] \mathrm{X}\left(\mathrm{X}=\left[\mathrm{AlCl}_{4}\right](3),\left[\mathrm{GaCl}_{4}\right](4),\left[\mathrm{B}\left(\mathrm{C}_{6} \mathrm{~F}_{5}\right)_{4}\right](5)\right)$ were generated from $\left(\mathrm{Cp}^{*} \mathrm{CrCl}(\mu-\mathrm{Cl})\right)_{2}(\mathbf{1})$ via reaction with a chloride abstraction reagent. Using a similar synthetic route, the reaction of $\mathbf{1}$, generated in situ, with MeLi and the borane $\mathrm{B}\left(\mathrm{C}_{6} \mathrm{~F}_{5}\right)_{3}$ gave crystals of the salt $\left[(\mathrm{Cp} * \mathrm{Cr})_{2}(u-\mathrm{Cl})_{3}\right]\left[\mathrm{MeB}\left(\mathrm{C}_{6} \mathrm{~F}_{5}\right)_{3}\right](6)$, while the complex $\left[\left(\mathrm{Cp} * \mathrm{Cr}_{2}(\mu-\right.\right.$ $\left.\mathrm{Cl})_{3}\right]\left[\mathrm{Me}_{2} \mathrm{~B}\left(\mathrm{C}_{6} \mathrm{~F}_{5}\right)_{2}\right]$ (7) was obtained, al beit in low yield, from the reaction of $[\mathrm{Cp} * \mathrm{CrMe}(\mu-$ $\mathrm{CI})]_{2}$ with $\mathrm{HB}\left(\mathrm{C}_{6} \mathrm{~F}_{5}\right)_{2}$. M onoal kylation of $\mathbf{5}$ with MeLi gave $\left[(\operatorname{Cp*} \operatorname{Cr}(\mu-\mathrm{CI}))_{2}(\mu-\mathrm{Me})\right]\left[\mathrm{B}\left(\mathrm{C}_{6} \mathrm{~F}_{5}\right)_{4}\right]$ (8), while the related mono(phosphide)-bridged cationic species [(Cp*Cr) $\left.2\left(\mu-\mathrm{PPh}_{2}\right)(\mu-\mathrm{Cl})_{2}\right]-$ [ $\left.\mathrm{B}\left(\mathrm{C}_{6} \mathrm{~F}_{5}\right)_{4}\right]$ (9) was derived from 5 via reaction with $\mathrm{Ph}_{2} \mathrm{PLi}$. The bis(phosphide)-bridged species [(Cp*Cr $\left.\left.\left(\mu-\mathrm{PPh}_{2}\right)\right)_{2}(\mu-\mathrm{Cl})\right]\left[\mathrm{AlMe}_{3} \mathrm{Cl}\right]$ (10) was derived from reaction mixtures of $\mathbf{1}, \mathrm{Ph}_{2} \mathrm{PLi}$, and AIM $e_{3}$, while monoalkylation of $\mathbf{1}$ with MeLi followed by treatment with $\mathrm{Ph}_{2} \mathrm{PLi}$ and $\mathrm{AlMe}_{3}$ yielded $\left[\left(C p^{*} \mathrm{Cr}\left(u-\mathrm{PPh}_{2}\right)\right)_{2}(u-\mathrm{Me})\right]\left[\left(\mathrm{Me} \mathrm{e}_{3} \mathrm{Al}\right)_{2}(u-\mathrm{Cl})\right]$ (11). The neutral phosphide-bridged species $\left(\mathrm{Cp}^{*} \mathrm{Cr}\left(\mu-\mathrm{PPh}_{2}\right)\right)_{2}\left(\mu-\mathrm{CH}_{2}\right)(\mathbf{1 2})$ and $\left(\mathrm{Cp}^{*} \mathrm{Cr}\right)_{2}\left(\mu-\mathrm{PPh}_{2}\right)(\mu-\mathrm{Cl})\left(\mu-\mathrm{CH}_{2}\right)$ (13) were obtained from reactions of $\mathbf{1}$, MeLi, and $\mathrm{Ph}_{2} \mathrm{PLi}$. X-ray structural data are reported from compounds 5-13. The synthetic routes and the structural data are discussed.

## Introduction

The chemistry of $\mathrm{Cr}(\mathrm{III})$ is particularly difficult to study, as a result of its paramagnetic nature. Nonetheless, the research groups of Theopold, ${ }^{1-4}$ and more recently Poli ${ }^{5-7}$ and others, ${ }^{8-11}$ have made extensive progress in developing an understanding of the structure, magnetic properties, ${ }^{12-14}$ and reactivity of $\mathrm{Cr}(\mathrm{III})$. While much of this work has been focused on the organometallic chemistry of Cr alkyls with olefin polymerization catalysis as the principal motivation, $2,3,11,13,15-22$ other work has focused on the fundamental structural and reactivity questions around Cr

[^0]oxo and sulfido complexes. ${ }^{23-29}$ In exploring alternative ligand sets for Cr , amido derivatives have garnered recent attention. $9,18,30,31$ While constrained-geometry ${ }^{18}$ and diimine ${ }^{30} \mathrm{Cr}$ complexes have been shown to offer new polymerization catalysts, the variety of structural types of $\mathrm{Cp}{ }^{*} \mathrm{Cr}^{\prime \prime \prime}$ amides has been explored and shown to depend on the nature of the amido substituents. ${ }^{9}$ In seeking development of $\mathrm{Cr}(\mathrm{III})$ chemistry employing phosphido ligands, we report herein a series of diphen-ylphosphido-bridged dinuclear Cr (III) salts. The nature of these species is described, and the implications of this chemistry are considered.

[^1]
## Experimental Section

General Data. All preparations were done under an atmosphere of dry, $\mathrm{O}_{2}$-free $\mathrm{N}_{2}$ employing both Schlenk line techniques and Innovative Technologies, MBraun, or Vacuum Atmospheres inert-atmosphere gloveboxes. Solvents were purified employing Grubbs' type column systems manufactured by Innovative Technology. All organic reagents were purified by conventional methods. ${ }^{1} \mathrm{H},{ }^{31} \mathrm{P}\left\{{ }^{1} \mathrm{H}\right\},{ }^{11} \mathrm{~B}\left\{{ }^{1} \mathrm{H}\right\}$, and ${ }^{19} \mathrm{~F}$ NMR spectra were recorded on Bruker Avance 300 or 500 spectrometers. All NMR spectra were recorded in $\mathrm{CDCl}_{3}$. Trace amounts of protonated solvents were used as references for the ${ }^{1} \mathrm{H}$ NMR data, and chemical shifts are reported relative to SiMe4. ${ }^{31} \mathrm{P},{ }^{19} \mathrm{~F}$, and ${ }^{11} \mathrm{~B}$ NMR spectra are referenced to $85 \%$ $\mathrm{H}_{3} \mathrm{PO}_{4}, \mathrm{CFCl}_{3}$, and $\mathrm{NaBH}_{4}$, respectively. Magnetic susceptibility was determined by the Evans method. ${ }^{32}$ Guelph Chemical Laboratories or in-house elemental analysis services were employed to perform combustion analyses. The species $\left(\mathrm{Cp}^{*} \mathrm{CrCl}(\mu-\mathrm{Cl})\right)_{2}(\mathbf{1})$ and $\left(\mathrm{Cp}^{*} \mathrm{CrMe}(\mu-\mathrm{Cl})\right)_{2}$ (2) were generated as previously described in the literature. ${ }^{15,33}$

Synthesis of $\left[(\mathbf{C p} * \mathbf{C r})_{2}(\mu-\mathrm{Cl})_{3}\right] X\left(X=\left[\mathrm{AlCl}_{4}\right](3),\left[\mathrm{GaCl}_{4}\right]\right.$ (4), $\left.\left[\mathbf{B}\left(\mathbf{C}_{6} \mathbf{F}_{5}\right)_{4}\right](5)\right)$. These compounds were prepared in a similar manner using $\mathrm{AlCl}_{3}, \mathrm{GaCl}_{3}$, and $\left[\mathrm{Ph}_{3} \mathrm{C}\right]\left[\mathrm{B}\left(\mathrm{C}_{6} \mathrm{~F}_{5}\right)_{4}\right]$, respectively. To a stirred THF suspension of $\mathrm{CrCl}_{3} \cdot 3 \mathrm{THF}$ ( $0.108 \mathrm{~g}, 0.29 \mathrm{mmol}$ ) was added Cp*Li ( $0.041 \mathrm{~g}, 0.29 \mathrm{mmol}$ ) in THF. The mixture was stirred for 1 h at $25^{\circ} \mathrm{C}$, and the volatiles were removed under vacuum. To the residue was added $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ followed by $\mathrm{AlCl}_{3}(0.020 \mathrm{~g}, 0.145 \mathrm{mmol})$. The solution was stirred for 2 days and filtered through Celite. The addition of hexane gave dark blue crystals. 3: yield 0.040 g , $43 \%$. Anal. Calcd (found) for $\mathrm{C}_{20} \mathrm{H}_{30} \mathrm{Cr}_{2} \mathrm{AlCl}_{7}: \mathrm{C}, 36.98$ (37.20); H, 4.65 (5.12). ${ }^{1} \mathrm{H}$ NMR: $\delta-12.10$ (br, Cp*). X-ray unit cell data: orthorhombic, $a=12.630$ (7) $\AA, b=20.85(1) \AA, c=23.07-$ (1) $\AA, V=6078(1) \AA^{3}, 4$ : yield $0.045 \mathrm{~g}, 46 \%$. Anal. Calcd (found) for $\mathrm{C}_{20} \mathrm{H}_{30} \mathrm{Cr}_{2} \mathrm{GaCl}_{7}: \mathrm{C}, 34.70$ (34.50); $\mathrm{H}, 4.37$ (3.61). ${ }^{1} \mathrm{H}$ NMR: $\delta-12.30$ (br, Cp*). X-ray unit cell data: orthorhombic, $\mathrm{a}=$ 20.81(1) $\AA, b=12.661(7) \AA, c=23.08(1) \AA, V=6082(1) \AA^{3} .5$ : yield $0.066 \mathrm{~g}, 40 \%$. Anal. Calcd (found) for $\mathrm{C}_{44} \mathrm{H}_{30} \mathrm{~F}_{20} \mathrm{Cr}_{2} \mathrm{BCl}_{3}$ : C, 45.57 ( 45.80 ); H, 2.61 (2.49). ${ }^{1} \mathrm{H}$ NMR: $\delta-12.0$ (br, Cp*). ${ }^{11}$ B NMR: $\delta-20.7$. ${ }^{19}$ F NMR: $\delta-132.8,-163.3,-167.0$.

Synthesis of $\left[(\mathbf{C p} * \mathbf{C r})_{2}(\mu-\mathrm{Cl})_{3}\right]\left[\mathrm{MeB}\left(\mathrm{C}_{6} \mathrm{~F}_{5}\right)_{3}\right]$ (6). To a stirred THF suspension of $\mathrm{CrCl}_{3} \cdot 3 \mathrm{THF}(0.094 \mathrm{~g}, 0.25 \mathrm{mmol})$ was added Cp*Li ( $0.036 \mathrm{~g}, 0.25 \mathrm{mmol}$ ) in THF. The mixture was stirred for 1 h at $25^{\circ} \mathrm{C}$. MeLi ( $1.4 \mathrm{M} ; 0.080 \mathrm{~mL}, 0.125$ mmol ) was added. After the volatiles were removed under vacuum, to the residue was added $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ followed by $\mathrm{B}\left(\mathrm{C}_{6} \mathrm{~F}_{5}\right)_{3}$ ( $0.064 \mathrm{~g}, 0.125 \mathrm{mmol}$ ). The sol ution was stirred for 2 days and filtered through Celite. The addition of hexane gave dark blue crystals. Yield: $0.045 \mathrm{~g}, 37 \%$. Anal. Calcd (found) for $\mathrm{C}_{39} \mathrm{H}_{33^{-}}$ $\mathrm{F}_{15} \mathrm{Cr}_{2} \mathrm{BCl}_{3} \cdot 0.5 \mathrm{C}_{6} \mathrm{H}_{6}:$ C, 48.19 (47.78); $\mathrm{H}, 3.47$ (3.31). ${ }^{1} \mathrm{H}$ NMR: $\delta 0.5$ (br, Me-B), -12.03 (br, Cp*). ${ }^{11}$ B NMR: $\delta-19.0$. ${ }^{19}$ F NMR: $\delta-133.2,-165.2,-167.6$.

Synthesis of $\left[\left(\mathbf{C p}{ }^{*} \mathbf{C r}\right)_{2}(\mu-\mathrm{Cl})_{3}\right]\left[\mathrm{Me}_{2} \mathrm{~B}\left(\mathrm{C}_{6} \mathrm{~F}_{5}\right)_{2}\right]$ (7). To a stirred $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ solution of $\mathbf{2}(0.035 \mathrm{~g}, 0.147 \mathrm{mmol})$ was added $\mathrm{HB}\left(\mathrm{C}_{6} \mathrm{~F}_{5}\right)_{2}(0.051 \mathrm{~g}, 0.147 \mathrm{mmol})$ in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$. The resulting solution was stirred for 2 days at room temperature. Crystallization from benzene/hexane gave dark crystals. Yield: 0.020 g, $16 \%$. Anal. Calcd (found) for $\mathrm{C}_{34} \mathrm{H}_{36} \mathrm{~F}_{10} \mathrm{BCr}_{2} \mathrm{Cl}_{3}$ : C, 47.72 (47.28); H, 4.24 (3.87). ${ }^{1} \mathrm{H}$ NMR: $\delta-12.10$ (br, $\mathrm{Cp}^{*}$ ). ${ }^{11} \mathrm{~B}$ NMR: $\delta-19.1 .{ }^{19} \mathrm{~F}$ NMR: $\delta-132.4,-164.2,-167.1$.

Synthesis of $\left[\left(\mathrm{Cp}^{*} \operatorname{Cr}(\mu-\mathrm{Cl})\right)_{2}(\mu-\mathrm{Me})\right]\left[\mathrm{B}\left(\mathrm{C}_{6} \mathrm{~F}_{5}\right)_{4}\right]$ (8). To a stirred THF solution of $\mathbf{5}(0.125 \mathrm{mmol})$ which was prepared in situ was added MeLi ( 1.4 M ; $0.267 \mathrm{~mL}, 0.375 \mathrm{mmol}$ ). The solution was stirred for 2 days and filtered through Celite. Crystallization from $\mathrm{CH}_{2} \mathrm{Cl}_{2} /$ hexane gave dark purplecrystals. Yield: $0.040 \mathrm{~g}, 30 \%$. Anal. Calcd (found) for $\mathrm{C}_{45} \mathrm{H}_{33} \mathrm{~F}_{20} \mathrm{BCr}_{2}-$ $\mathrm{Cl}_{2}: \mathrm{C}, 47.44$ (47.90); H, 2.92 (3.20). ${ }^{1} \mathrm{H}$ NMR: $\delta-12.01$ (br,

[^2]Cp*). ${ }^{11}$ B NMR: $\delta-20.7$. ${ }^{19}$ F NMR: $\delta-132.7,-162.7,-166.4$. X-ray unit cell data: monodinic, $a=18.93(1) \AA, b=34.05(2)$ $\AA, \mathrm{c}=14.970(8) \AA, \beta=99.76(1)^{\circ}, \mathrm{V}=9507(1) \AA^{3}$.

Synthesis of $\left[\left(\mathbf{C p} * \mathbf{C r}_{2}\right)_{2}\left(\mu-\mathrm{PPh}_{2}\right)(\mu-\mathrm{Cl})_{2}\right]\left[\mathrm{B}\left(\mathrm{C}_{6} \mathrm{~F}_{5}\right)_{4}\right]$ (9). To a stirred toluene solution of $5(0.125 \mathrm{mmol})$ which was prepared in situ was added $\mathrm{Ph}_{2} \mathrm{PLi}(0.024 \mathrm{~g}, 0.125 \mathrm{mmol})$. The solution was stirred for 2 days and filtered through Celite. Crystallization from toluene/ $\mathrm{CH}_{2} \mathrm{Cl}_{2} /$ hexane gave dark crystals. Yield: $0.055 \mathrm{~g}, 34 \%$. Anal. Calcd (found) for $\mathrm{C}_{56} \mathrm{H}_{40} \mathrm{~F}_{20} \mathrm{PBCr}_{2-}$ $\mathrm{Cl}_{2}: ~ \mathrm{C}, 51.36$ (50.89); H, 3.08 (2.71). ${ }^{1} \mathrm{H}$ NMR: $\delta 7.72,7.37$, 7.19, 7.12 (br, Ph H), -5.00 (br, Cp*). ${ }^{31}$ P NMR: silent. ${ }^{11} \mathrm{~B}$ NMR: $\delta-21.0 .{ }^{19} \mathrm{~F}$ NMR: $\delta-132.3,-163.1,-166.7$.

Synthesis of $\left[\left(\mathrm{Cp}^{*} \mathrm{Cr}\left(\mu-\mathrm{PPh}_{2}\right)\right)_{2}(\mu-\mathrm{Cl})\right]\left[\mathrm{AlMe}_{3} \mathrm{CI}\right]$ (10). To a stirred THF suspension of $\mathrm{CrCl}_{3} \cdot 3 \mathrm{THF}(0.094 \mathrm{~g}, 0.25 \mathrm{mmol})$ was added Cp*Li ( $0.036 \mathrm{~g}, 0.25 \mathrm{mmol}$ ) in THF. The mixture was stirred for 1 h at room temperature. To the solution was added $\mathrm{Ph}_{2} \mathrm{PLi}(0.048 \mathrm{~g}, 0.25 \mathrm{mmol})$ in THF. The resulting solution was stirred for 2 days. After the volatiles were removed under vacuum, to the residue was added benzene following $\mathrm{AlMe}_{3}(0.045 \mathrm{~g}, 0.626 \mathrm{mmol})$. The resulting sol ution was stirred for 2 days and filtered through Celite. Crystallization from benzene/hexane gave dark crystals, Yield: 0.015 $\mathrm{g}, 13 \%$. Anal. Calcd (found) for $\mathrm{C}_{47} \mathrm{H}_{59} \mathrm{P}_{2} \mathrm{Cr}_{2} \mathrm{AlCl}_{2} \cdot 0.5 \mathrm{C}_{6} \mathrm{H}_{6}$ : C, 64.79 (64.32); H, 6.74 (6.45). ${ }^{1} \mathrm{H}$ NMR: $\delta 7.63,7.45,7.14,7.07$ (br, Ph H), Cp* not observed. ${ }^{31}$ P NMR: silent.

Synthesis of [(Cp* $\left.\left.\operatorname{Cr}\left(\mu-\mathrm{PPh}_{2}\right)\right)_{2}(\mu-\mathrm{Me})\right]\left[\left(\mathrm{Me}_{3} \mathrm{Al}\right)_{2}(\mu-\mathrm{Cl})\right]$ (11). To a stirred THF suspension of $\mathrm{CrCl}_{3}(0.040 \mathrm{~g}, 0.25 \mathrm{mmol})$ was added Cp*Li ( $0.036 \mathrm{~g}, 0.25 \mathrm{mmol}$ ) in THF. The mixture was stirred overnight at room temperature. To the solution was added MeLi ( $1.4 \mathrm{M} ; 0.09 \mathrm{~mL}, 0.125 \mathrm{mmol}$ ) followed by $\mathrm{Ph}_{2^{-}}$ PLi $(0.048 \mathrm{~g}, 0.25 \mathrm{mmol})$ in THF. The resulting solution was stirred for 2 days. After the volatiles were removed under vacuum, $\mathrm{AlMe}_{3}(0.054 \mathrm{~g}, 0.750 \mathrm{mmol})$ was added to the residue. Theresulting solution was stirred a further 2 days and filtered through Celite. Removal of the solvent and recrystallization of the residue from benzene/hexane gave dark crystals of $\mathbf{1 1}$. Yield: $0.030 \mathrm{~g}, 25 \%$. Anal. Calcd (found) for $\mathrm{C}_{51} \mathrm{H}_{71} \mathrm{P}_{2} \mathrm{Cr}_{2} \mathrm{Al}_{2}-$ CI: C, 65.20 (64.78); H, 7.62 (7.15). $\mu=3.42 \mu_{\mathrm{B}} .{ }^{1} \mathrm{H}$ NMR: $\delta$ 7.64, 7.37, 7.16, 6.92 (br, Ph H), Cp* not observed. ${ }^{31}$ P NMR: silent.

Synthesis of $\left(\mathrm{Cp}^{*} \mathrm{Cr}\left(\mu-\mathrm{PPh}_{2}\right)\right)_{2}\left(\mu-\mathrm{CH}_{2}\right)$ (12) and $\left(\mathrm{Cp}^{*} \mathrm{Cr}\right)_{2-}$ $\left(\mu-\mathrm{PPh}_{2}\right)(\mu-\mathrm{Cl})\left(\mu-\mathrm{CH}_{2}\right)(13)$. To a stirred THF suspension of $\mathrm{CrCl}_{3} \cdot 3 \mathrm{THF}(0.108 \mathrm{~g}, 0.29 \mathrm{mmol})$ was added Cp*Li $(0.041 \mathrm{~g}$, 0.29 mmol ) in THF. The mixture was stirred for 1 h at room temperature. To the solution was added MeLi ( 1.4 M ; 0.207 $\mathrm{mL}, 0.29 \mathrm{mmol})$ followed by $\mathrm{Ph}_{2} \mathrm{PLi}(0.056 \mathrm{~g}, 0.29 \mathrm{mmol})$ in THF. The resulting solution was stirred for 2 days and then filtered through Celite. Crystallization from benzene gave dark crystals of 12. Yield: $0.055 \mathrm{~g}, 50 \%$. Upon standing for extended period of time, 13 was obtained in very low yield ( $<6 \%$ ). 12: $\mu=4.09 \mu_{\mathrm{B}} ;{ }^{1} \mathrm{H}$ NMR $\delta 7.90,7.57,6.89,6.76$ (br, Ph H), Cp* silent; ${ }^{31}$ P NMR silent. Anal. Calcd (found) for $\mathrm{C}_{45} \mathrm{H}_{52} \mathrm{Cr}_{2} \mathrm{P}_{2}$ : C, 71.23 (70.80); H, 6.91 (7.15). 13: yield $0.006 \mathrm{~g}, 6 \%$; ${ }^{12} \mathrm{H}$ NMR $\delta 7.61,7.43,7.17,6.92$ (br, Ph H), Cp* silent; ${ }^{31}$ P NMR silent. Anal. Calcd (found) for $\mathrm{C}_{33} \mathrm{H}_{42} \mathrm{Cr}_{2} \mathrm{PCl}$ : C, 65.07 (64.59); H, 6.95 (6.47).

X-ray Data Collection and Reduction. The crystals were manipulated and mounted in capillaries in a glovebox, thus maintaining a dry, $\mathrm{O}_{2}$-free environment for each crystal. Diffraction experiments were performed on a Siemens SMART System CCD diffractometer. The data were collected for a hemisphere of data in 1329 frames with 10 s exposure times. Crystal data are summarized in Table 1. The observed extinctions were consistent with the space groups in each case. A measure of decay was obtained by re-collecting the first 50 frames of each data set. The intensities of reflections within these frames showed no statistically significant change over the duration of the data collections. An empirical absorption correction based on redundant data was applied to each data

${ }^{\text {a }}$ All data collected at $24{ }^{\circ} \mathrm{C}$ with Mo K $\alpha$ radiation $(\lambda=0.71069 \AA), R=\Sigma| | F_{o}\left|-\left|F_{d}\right|\right| \Sigma\left|F_{0}\right|, R_{w}=\left[\Sigma\left[w\left(F_{0}{ }^{2}-F_{c}^{2}\right)^{2}\right] / \sum\left[w\left(F_{0}{ }^{2}\right)^{2}\right]\right]^{0.5}$.
set. Subsequent solution and refinement was performed using the SHELXTL solution package.

Structure Solution and Refinement. Non-hydrogen atomic scattering factors were taken from the literature tabulations. ${ }^{34}$ The heavy-atom positions were determined using direct methods. The remaining non-hydrogen atoms were located from successive difference Fourier map calculations. The refinements were carried out by using full-matrix leastsquares techniques on $F$, minimizing the function $w\left(\left|F_{0}\right|-\right.$ $\left.\mid \mathrm{F}_{\mathrm{c}}\right)^{2}$ where the weight w is defined as $4 \mathrm{~F}_{0}{ }^{2} / 2 \sigma\left(\mathrm{~F}_{0}{ }^{2}\right)$ and $\mathrm{F}_{\mathrm{o}}$ and $F_{c}$ are the observed and calculated structure factor amplitudes. In the final cycles of each refinement, all non-hydrogen atoms were assigned ani sotropic temperature factors. In cases where disorder was implied by the difference maps or the thermal parameters, attempts to model the disorder were undertaken. Such a model was deemed acceptable if the thermal parameters were typical and the geometry was chemically reasonable. In such cases the disordered atoms were treated isotropically. Carbon-bound hydrogen atom positions were calculated and allowed to ride on the carbon to which they are bonded, assuming a $\mathrm{C}-\mathrm{H}$ bond length of $0.95 \AA \AA$. Hydrogen atom temperature factors were fixed at 1.10 times the isotropic temperature factor of the carbon atom to which they are bonded. The hydrogen atom contributions were calculated but not refined.

## Results and Discussion

The species $\left(\mathrm{Cp}^{*} \mathrm{CrCl}(\mu-\mathrm{Cl})\right)_{2}$ was generated and reacted with a chloride abstraction reagent such as $\mathrm{AlCl}_{3}, \mathrm{GaCl}_{3}$, or $\left[\mathrm{Ph}_{3} \mathrm{C}\right]\left[\mathrm{B}\left(\mathrm{C}_{6} \mathrm{~F}_{5}\right)_{4}\right]$. Subsequent workup and recrystallization gave the salts formulated as $\left[(\mathrm{Cp} * \mathrm{Cr})_{2}(\mu-\mathrm{Cl})_{3}\right] \mathrm{X}\left(\mathrm{X}=\left[\mathrm{AICl}_{4}\right](3),\left[\mathrm{GaCl}_{4}\right](4),\left[\mathrm{B}\left(\mathrm{C}_{6} \mathrm{~F}_{5}\right)_{4}\right]\right.$ (5)). The formulations of these compounds were consistent with the observation of a single resonance in the ${ }^{1} \mathrm{H}$ NMR spectra. In the last case, ${ }^{11} \mathrm{~B}$ and ${ }^{19} \mathrm{~F}$ NMR confirmed the presence of the perfluorinated borate anion. Recrystallization of these species gave dark blue crystals in each case. Crystallographic data were obtained for each of these species. In the case of $\mathbf{3}$ and 4, initial solutions were consistent with the formulations; however, disorder issues wereevident in both the anions and cations. Extensive attempts to model the disorders were problematic. In the case of 5, a satisfactory solution was obtained and refined where the asymmetric unit contained two anions and cations. The borate anions were as expected. The cations were formulated as $\left[\left(C p^{*} \mathrm{Cr}\right)_{2}(\mu-\mathrm{Cl})_{3}\right]^{+}$with the two $\mathrm{Cp}^{*}$ rings oriented in a parallel fashion perpendicular to the $\mathrm{Cr}-\mathrm{Cr}$ vector (Figure 1). For one of the cations in the asymmetric unit it was necessary to model a 4-fold disorder of the bridging chloride atoms. On the other hand, the second

Figure 1. ORTEP drawing of one of the two cations of 5 in the asymmetric unit. Thermal ellipsoids are shown at the $30 \%$ level. Hydrogen atoms have been omitted for clarity. Selected bond distances ( $\AA$ ) and angles (deg): $\mathrm{Cr}(1)-\mathrm{Cl}(2)=2.3392$ (18), $\mathrm{Cr}(1)-\mathrm{Cl}(1)=2.3526(18), \mathrm{Cr}(1)-$ $\mathrm{Cl}(3)=2.3563(17), \mathrm{Cr}(2)-\mathrm{Cl}(1)=2.3534(18), \mathrm{Cr}(2)-$ $\mathrm{Cl}(2)=2.3550(17), \mathrm{Cr}(2)-\mathrm{Cl}(3)=2.3582(19), \mathrm{Cr}(1)-$ $\mathrm{Cr}(2)=2.8157(13) ; \mathrm{Cl}(1)-\mathrm{Cr}(2)-\mathrm{Cl}(2)=87.41(7), \mathrm{Cl}(1)-$ $\mathrm{Cr}(2)-\mathrm{Cl}(3)=88.37(6), \mathrm{Cl}(2)-\mathrm{Cr}(2)-\mathrm{Cl}(3)=87.38(7)$, $\mathrm{Cr}(1)-\mathrm{Cl}(1)-\mathrm{Cr}(2)=73.50(5), \mathrm{Cr}(1)-\mathrm{Cl}(2)-\mathrm{Cr}(2)=73.71-$ (5), $\mathrm{Cr}(1)-\mathrm{Cl}(3)-\mathrm{Cr}(2)=73.35(5)$.

Figure 2. ORTEP drawing of 7. Thermal ellipsoids are shown at the 30\% level. Hydrogen atoms have been omitted for clarity.
cation was refined without such a disorder. The latter case offers a more reliable metric of the $\mathrm{Cr}-\mathrm{Cl}$ distances, which was found to be $2.3524(20) \AA$. On the other hand, the $\mathrm{Cr}-\mathrm{Cr}$ separations are very similar in the two models (ordered cation, 2.8157(13) $\AA$; disordered cation, 2.825(2) Å).

Using a similar synthetic route, the reaction of $\mathbf{1}$ generated in situ with MeLi and the borane $\mathrm{B}\left(\mathrm{C}_{6} \mathrm{~F}_{5}\right)_{3}$ gave crystals of the salt $\left[(\mathrm{Cp} * \mathrm{Cr})_{2}(\mu-\mathrm{Cl})_{3}\right]\left[\mathrm{MeB}\left(\mathrm{C}_{6} \mathrm{~F}_{5}\right)_{3}\right]$ (6). X-ray crystallography reveal ed that this species also crystallized in a disordered fashion. This disorder involved a 4-fold disorder of the Cl . This was satisfactorily modeled with 12 partial Cl positions located in the plane bisecting the $\mathrm{Cr}-\mathrm{Cr}$ vector. The $\mathrm{Cr}-\mathrm{Cr}$ separation was found to be similar to that in 5 (2.820(5) Å). A compl etely ordered structure was obtained for the complex $\left[(\mathrm{Cp} * \mathrm{Cr})_{2}(\mu-\mathrm{Cl})_{3}\right]\left[\mathrm{Me}_{2} \mathrm{~B}\left(\mathrm{C}_{6} \mathrm{~F}_{5}\right)_{2}\right]$ (7) (Figure 2). This species was derived, albeit in low yield, from the reaction of $\left[\mathrm{Cp}^{*} \mathrm{CrMe}(\mu-\mathrm{Cl})\right]_{2}$ with $\mathrm{HB}\left(\mathrm{C}_{6} \mathrm{~F}_{5}\right)_{2}$ in $\mathrm{CH}_{2^{-}}$ $\mathrm{Cl}_{2}$. In this case, the $\mathrm{Cr}-\mathrm{Cl}$ distances and the $\mathrm{Cl}-\mathrm{Cr}-$ Cl angles averaged $2.363(4) \AA$ and $74.4(1)^{\circ}$, respectively, while the $\mathrm{Cr}-\mathrm{Cr}$ separation was found to be 2.859(2) $\AA$, a metric similar to those seen in the previous salts.

The compound $\left[\left(C p^{*} \mathrm{Cr}\right)_{2}(\mu-\mathrm{Me})_{3}\right]\left[B F_{4}\right],{ }^{12}$ which represents the only previously known triply bridged dinuclear Cr salt, was generated via protonation of $(\mathrm{Cp} * \mathrm{Cr}(\mu-\mathrm{Me}))_{2}\left(\mu-\mathrm{CH}_{2}\right)$. Although crystallographic data have not been published to our knowledge, the $\mathrm{Cr}-\mathrm{Cr}$ distance is described as $2.42 \AA$, significantly shorter than those found in 5-7.

Attempts to alkylate $\mathbf{5}$ with MeLi afforded the species formulated as $\left[\left(\mathrm{Cp}^{*} \mathrm{Cr}(\mu-\mathrm{Cl})\right)_{2}(\mu-\mathrm{Me})\right]\left[\mathrm{B}\left(\mathrm{C}_{6} \mathrm{~F}_{5}\right)_{4}\right](8)$, which

Figure 3. ORTEP drawing of the cation of 9. Thermal ellipsoids are shown at the $30 \%$ level. Selected bond distances $(\AA \AA)$ and angles (deg): $\mathrm{Cr}(1)-\mathrm{Cl}(2)=2.323(4)$, $\mathrm{Cr}(1)-\mathrm{Cl}(1)=2.340(4), \mathrm{Cr}(1)-\mathrm{P}(1)=2.390(5), \mathrm{Cr}(1)-$ $\mathrm{Cr}(2)=2.802(4), \mathrm{Cr}(2)-\mathrm{Cl}(1)=2.324(4), \mathrm{Cr}(2)-\mathrm{Cl}(2)=$ $2.340(4), \mathrm{Cr}(2)-\mathrm{P}(1)=2.404(4) ; \mathrm{Cl}(2)-\mathrm{Cr}(1)-\mathrm{Cl}(1)=88.74-$ (15), $\mathrm{Cl}(2)-\mathrm{Cr}(1)-\mathrm{P}(1)=87.90(11), \mathrm{Cl}(1)-\mathrm{Cr}(1)-\mathrm{P}(1)=$ 88.16(11), $\mathrm{Cl}(1)-\mathrm{Cr}(2)-\mathrm{Cl}(2)=88.74(16), \mathrm{Cl}(1)-\mathrm{Cr}(2)-$ $\mathrm{P}(1)=88.24(12), \mathrm{Cl}(2)-\mathrm{Cr}(2)-\mathrm{P}(1)=87.20(10), \mathrm{Cr}(2)-$ $\mathrm{Cl}(1)-\mathrm{Cr}(1)=73.86(14), \mathrm{Cr}(1)-\mathrm{Cl}(2)-\mathrm{Cr}(2)=73.88(10)$, $\mathrm{Cr}(1)-\mathrm{P}(1)-\mathrm{Cr}(2)=71.55(8)$.
was isolated as dark, purple crystals in $30 \%$ yield. The bridging methyl resonances were not observed in the ${ }^{1}$ H NMR spectrum. Although crystallographic data were obtained, a complete and satisfactory solution was not. Nonetheless, the data appeared consistent with the presence of the $\mathrm{Cp}^{*} \mathrm{Cr}$ fragments and the anion, although the nature and positions of the bridging atoms could not unambiguously be determined, as a result of disorder. Nonetheless, one piece of preliminary metric information that supports the above formulation was the observed $\mathrm{Cr}-\mathrm{Cr}$ distance of 2.59(1) $\AA$. This distance is markedly shorter than that seen in 5-7, while being longer than that alluded to by Theopold et al. for $\left[\left(C p^{*} C r\right)_{2}(u-M e)_{3}\right]\left[\mathrm{BF}_{4}\right](2.42 \AA) .{ }^{12}$ This, together with elemental analyses, was consistent with monomethylation of the bridging positions.

Related phosphide-bridged cationic species were derived from the reaction of 5 with the phosphide $\mathrm{Ph}_{2^{-}}$ PLi. Following workup the species formulated as $\left[\left(\mathrm{Cp} * \mathrm{Cr}_{2}\left(\mu-\mathrm{PPh}_{2}\right)(\mu-\mathrm{Cl})_{2}\right]\left[\mathrm{B}\left(\mathrm{C}_{6} \mathrm{~F}_{5}\right)_{4}\right](9)\right.$ was isolated in 34\% yield. The X-ray structure (Figure 3) of 9 confirmed the formulation, revealing a structure of the cation that is analogous to that seen in 5-7, with a phosphide replacing one of the bridging chloride atoms. The bridging $\mathrm{Cr}-\mathrm{Cl}$ and $\mathrm{Cr}-\mathrm{P}$ distances averaged 2.332(5) and 2.397 (5) $\AA$, respectively, while the $\mathrm{Cr}-\mathrm{Cl}-\mathrm{Cr}$ and $\mathrm{Cr}-\mathrm{P}-\mathrm{Cr}$ angles at the bridging atoms were found to be 73.87(14) and 71.55(8) ${ }^{\circ}$, respectively. The $\mathrm{Cr}-\mathrm{Cr}$ distance of 2.802(1) $\AA$ was slightly shorter than those found in 5-7.

In attempts to isolate related neutral phosphidebridged species, the reaction of $\mathbf{1}$ with $\mathrm{Ph}_{2} \mathrm{PLi}$ was undertaken. Although reaction was evident from the observed col or change, repeated attempts under various

Figure 4. ORTEP drawing of the cation of 10. Thermal ellipsoids are shown at the $30 \%$ level. Hydrogen atoms have been omitted for clarity. Selected bond distances $(\AA)$ and angles (deg): $\mathrm{Cr}(1)-\mathrm{Cl}(1)=2.353(2), \mathrm{Cr}(1)-\mathrm{P}(1)=2.392-$ (2), $\mathrm{Cr}(1)-\mathrm{P}(2)=2.393(3), \mathrm{Cr}(1)-\mathrm{Cr}(2)=2.7984(19)$, $\mathrm{Cr}(2)-\mathrm{Cl}(1)=2.346(3), \mathrm{Cr}(2)-\mathrm{P}(1)=2.385(2), \mathrm{Cr}(2)-$ $\mathrm{P}(2)=2.398(2) ; \mathrm{Cl}(1)-\mathrm{Cr}(1)-\mathrm{P}(1)=86.14(8), \mathrm{Cl}(1)-\mathrm{Cr}(1)-$ $\mathrm{P}(2)=86.24(8), \mathrm{P}(1)-\mathrm{Cr}(1)-\mathrm{P}(2)=93.78(7), \mathrm{Cl}(1)-\mathrm{Cr}(2)-$ $P(1)=86.45(9), \mathrm{Cl}(1)-\mathrm{Cr}(2)-\mathrm{P}(2)=86.30(8), \mathrm{P}(1)-\mathrm{Cr}(2)-$ $\mathrm{P}(2)=93.84(8), \mathrm{Cr}(2)-\mathrm{Cl}(1)-\mathrm{Cr}(1)=73.09(7), \mathrm{Cr}(2)-\mathrm{P}(1)-$ $\operatorname{Cr}(1)=71.73(7), \operatorname{Cr}(1)-\mathrm{P}(2)-\mathrm{Cr}(2)=71.48(7)$.

Scheme 1

conditions to isolate clean product from this reaction were unsuccessful. N onetheless, subsequent reaction of what is presumed to be $\left(\mathrm{Cp}^{*} \mathrm{Cr}\left(\mu-\mathrm{PPh}_{2}\right) \mathrm{Cl}\right)_{2}$ with $\mathrm{AlMe}_{3}$ afforded the isolation of the bis(phosphide)-bridged salt $\left[\left(\mathrm{Cp}^{*} \mathrm{Cr}\left(\mu-\mathrm{PPh}_{2}\right)\right)_{2}(\mu-\mathrm{Cl})\right]\left[\mathrm{AlM} \mathrm{e}_{3} \mathrm{Cl}\right]$ (10) (Figure 4, Scheme 1). The anion was unexceptional, while the average $\mathrm{Cr}-\mathrm{P}$ and $\mathrm{Cr}-\mathrm{Cl}$ distances in the cation of $\mathbf{1 0}$ were found to be 2.392(2) and 2.350(2) $\AA$, respectively. The $\mathrm{Cr}-\mathrm{Cr}$ distance in $\mathbf{1 0}$ is $2.7984(19) \AA$, slightly less than that seen in 9, while the $\mathrm{Cr}-\mathrm{P}-\mathrm{Cr}$ angle of $71.50(9)^{\circ}$ is similar to that seen in 9.

Figure 5. ORTEP drawing of 11. Thermal ellipsoids are shown at the 30\% level. Hydrogen atoms have been omitted for clarity. Selected bond distances ( $\AA$ ) and angles (deg): $\mathrm{Cr}(1)-\mathrm{C}(45)=2.215(5), \mathrm{Cr}(1)-\mathrm{P}(2)=2.3559(14), \mathrm{Cr}(1)-$ $\mathrm{P}(1)=2.3672(14), \mathrm{Cr}(1)-\mathrm{Cr}(2)=2.6392(12), \mathrm{Cr}(2)-$ $\mathrm{C}(45)=2.238(5), \mathrm{Cr}(2)-\mathrm{P}(1)=2.3516(13), \mathrm{Cr}(2)-\mathrm{P}(2)=$ $2.3739(15), \mathrm{Al}(1)-\mathrm{Cl}(1)=2.382(2), \mathrm{Al}(2)-\mathrm{Cl}(1)=2.378-$ (2); $\mathrm{C}(45)-\mathrm{Cr}(1)-\mathrm{P}(2)=87.25(14), \mathrm{C}(45)-\mathrm{Cr}(1)-\mathrm{P}(1)=$ 87.99(16), $\mathrm{P}(2)-\mathrm{Cr}(1)-\mathrm{P}(1)=97.28(4), \mathrm{C}(45)-\mathrm{Cr}(2)-$ $\mathrm{P}(1)=87.84(15), \mathrm{C}(45)-\mathrm{Cr}(2)-\mathrm{P}(2)=86.28(15), \mathrm{P}(1)-$ $\mathrm{Cr}(2)-\mathrm{P}(2)=97.21(4), \mathrm{P}(1)-\mathrm{Cr}(2)-\mathrm{Cr}(1)=56.27(3), \mathrm{P}(2)-$ $\mathrm{Cr}(2)-\mathrm{Cr}(1)=55.76(4), \mathrm{Al}(2)-\mathrm{Cl}(1)-\mathrm{Al}(1)=116.02(7)$, $\mathrm{Cr}(2)-\mathrm{P}(1)-\mathrm{Cr}(1)=68.01(4), \mathrm{Cr}(1)-\mathrm{P}(2)-\mathrm{Cr}(2)=67.83-$ (3), $\mathrm{Cr}(1)-\mathrm{C}(45)-\mathrm{Cr}(2)=72.68(12)$.

Alkylation of $\mathbf{1}$ with MeLi in situ followed by treatment with 2 equiv of $\mathrm{Ph}_{2} \mathrm{PLi}$ and subsequent excess AlMe3 yielded $\left[\left(\mathrm{Cp}^{*} \mathrm{Cr}\left(\mu-\mathrm{PPh}_{2}\right)\right)_{2}(\mu-\mathrm{Me})\right]\left[\left(\mathrm{Me}_{3} \mathrm{Al}\right)_{2}(\mu-\mathrm{Cl})\right]-$ (11) in $25 \%$ yield (Figure 5). The anion was found to contain a chloride ion bridging two $\mathrm{AlMe}_{3}$ fragments with an average $\mathrm{Al}-\mathrm{Cl}$ distance of $2.380(2) \AA \AA$. The cation of 11 was similar to that seen in 10, with a methyl group replacing the bridging chloride. The $\mathrm{Cr}-\mathrm{P}$ distances average $2.3586(16) \AA$, while the $\mathrm{Cr}-\mathrm{C}$ bond lengths to the bridging methyl group average $2.226(5) \AA$. The corresponding $\mathrm{Cr}-\mathrm{C}-\mathrm{Cr}$ angle is $72.68(12)^{\circ}$. The result of methyl replacing Cl appears to be a slightly shorter $\mathrm{Cr}-\mathrm{Cr}$ distance of 2.6392(12) $\AA$ in 11 and a decrease in the $\mathrm{Cr}-\mathrm{P}-\mathrm{Cr}$ angle to 67.92(4) ${ }^{\circ}$.

The neutral phosphide- and methylene-bridged species $\left(\mathrm{Cp}^{*} \mathrm{Cr}\left(\mu-\mathrm{PPh}_{2}\right)\right)_{2}\left(\mu-\mathrm{CH}_{2}\right)(\mathbf{1 2})$ was isol ated from the reaction of 2 with 2 equiv of $\mathrm{Ph}_{2} \mathrm{PLi}$ by elimination of LiCl and methane in $50 \%$ yield (Figure 6, Scheme 1). Although not determined quantitatively, a ${ }^{1} \mathrm{H}$ NMR resonance attributable to methane was observed. In addition, an extremely small yield of a few crystals of (Cp*Cr) $)_{2}\left(\mu-\mathrm{PPh}_{2}\right)(\mu-\mathrm{Cl})\left(\mu-\mathrm{CH}_{2}\right)$ (13) was also obtained (Figure 7). Crystallographic data confirmed the neutral formulations, although the data for 13 revealed a disorder of the bridging Cl and $\mathrm{CH}_{2}$ ligands. In 12 the bridging $\mathrm{Cr}-\mathrm{P}$ and $\mathrm{Cr}-\mathrm{C}$ distances were found to be 2.3148(13) and 2.253(3) $\AA$, respectively. The corresponding $\mathrm{Cr}-\mathrm{P}$ distances in 13, averaging 2.3613(15) $\AA$, are slightly longer than in 12. The presence of the bridging methylene group in these species resulted in relatively short $\mathrm{Cr}-\mathrm{Cr}$ separations of $2.5517(13) \AA$ in 12 and 2.6134(11) $\AA$ in 13. The angles at the bridging $P$ and Cr centers $\left(\mathrm{Cr}-\mathrm{P}-\mathrm{Cr}: 12,66.89(3)^{\circ} ; \mathbf{1 3}, 67.20(3)^{\circ}\right)$ are similar but smaller than those seen in 9 and 10.

The data presented above describe neutral and phos-phido-bridged Cr dimers. The $\mathrm{Cr}-\mathrm{P}$ bonds found in

Figure 6. ORTEP drawing of 12. Thermal ellipsoids are shown at the 30\% level. Hydrogen atoms have been omitted for clarity. Selected bond distances ( $\AA$ ) and angles (deg): $\mathrm{Cr}(1)-\mathrm{C}(1)=2.253(3), \mathrm{Cr}(1)-\mathrm{P}(1)=2.3130(13), \mathrm{Cr}(1)-$ $\mathrm{P}(1)=2.3167(13), \mathrm{Cr}(1)-\mathrm{Cr}(1)=2.5517(13) ; \mathrm{C}(1)-\mathrm{Cr}(1)-$ $P(1)=91.36(6), C(1)-C r(1)-P(1)=91.26(5), P(1)-C r(1)-$ $\mathrm{P}(1)=93.56(4), \mathrm{Cr}(1)-\mathrm{P}(1)-\mathrm{Cr}(1)=66.89(3), \mathrm{Cr}(1)-\mathrm{C}(1)-$ $\operatorname{Cr}(1)=68.98(12)$.

these dimers all fall in the narrow range between 2.3130 (13) and $2.393(3) \AA \AA$. Although no previous reports of $\mathrm{Cr}(\mathrm{III})$ phosphides have appeared, these values can be compared with the Cr-P distances of 2.389(1), 2.396(1), 2.343(1), and 2.449(2) $\AA$ found in the dialkylphos-phide-bridged heterobimetallics $\left.\left(\mathrm{Me}_{3} \mathrm{P}\right)(\mathrm{OC})_{4} \mathrm{Cr}(\mu-\mathrm{PtBu})_{2}\right)$ $\operatorname{Rh}(\mathrm{COD}),\left(\mathrm{Me}_{3} \mathrm{P}\right)(\mathrm{OC})_{4} \mathrm{Cr}\left(\mu-\mathrm{PtBu} \mathrm{u}_{2}\right) \mathrm{Co}(\mathrm{CO})\left(\mathrm{PM}_{3}\right),{ }^{35}\left(\mathrm{Me}_{3}-\right.$ $\left.\mathrm{P})(\mathrm{OC})_{4} \mathrm{Cr}(\mu-\mathrm{PtBu})_{2}\right) \mathrm{NiCl}\left(\mathrm{PMe}_{3}\right)$, and $\left(\mathrm{Me}_{3} \mathrm{P}\right)(\mathrm{OC})_{4} \mathrm{Cr}(\mu-$ $\left.\mathrm{PtBu}_{2}\right) \mathrm{Rh}(\mathrm{CO})\left(\mathrm{PMe}_{3}\right),{ }^{36}$ respectively. In addition, the structural data for dimeric Cr species show trends (Table 2) consistent with previous observations. ${ }^{12}$ The

Figure 7. ORTEP drawing of 13. Thermal ellipsoids are shown at the 30\% level. Hydrogen atoms have been omitted for clarity. Selected bond distances ( $\AA$ ) and angles (deg): $\mathrm{Cr}(1)-\mathrm{C}(33)=1.983(15), \mathrm{Cr}(1)-\mathrm{C}(33 \mathrm{~B})=2.11(3), \mathrm{Cr}(1)-$ $\mathrm{Cl}(1)=2.333(3), \mathrm{Cr}(1)-\mathrm{P}(1)=2.3620(12), \mathrm{Cr}(1)-\mathrm{Cl}(1 \mathrm{~A})=$ $2.393(7), \mathrm{Cr}(1)-\mathrm{Cr}(2)=2.6134(11), \mathrm{Cr}(2)-\mathrm{C}(33 \mathrm{~B})=2.01-$ (3), $\mathrm{Cr}(2)-\mathrm{C}(33)=2.08(2), \mathrm{Cr}(2)-\mathrm{Cl}(1)=2.350(3), \mathrm{Cr}(2)-$ $\mathrm{Cl}(1 \mathrm{~A})=2.353(9), \mathrm{Cr}(2)-\mathrm{P}(1)=2.3606(15) ; \mathrm{C}(33)-\mathrm{Cr}(1)-$ $\mathrm{C}(33 \mathrm{~B})=78.5(8), \mathrm{C}(33)-\mathrm{Cr}(1)-\mathrm{Cl}(1)=89.2(6), \mathrm{C}(33)-$ $\mathrm{Cr}(1)-\mathrm{P}(1)=91.1(5), \mathrm{C}(33 \mathrm{~B})-\mathrm{Cr}(1)-\mathrm{P}(1)=89.8(8), \mathrm{C}(33 \mathrm{~B})-$ $\mathrm{Cr}(1)-\mathrm{Cl}(1 \mathrm{~A})=82.7(6), \mathrm{Cl}(1)-\mathrm{Cr}(1)-\mathrm{Cl}(1 \mathrm{~A})=93.4(3)$, $\mathrm{P}(1)-\mathrm{Cr}(1)-\mathrm{Cl}(1 \mathrm{~A})=93.2(2), \mathrm{C}(33 \mathrm{~B})-\mathrm{Cr}(2)-\mathrm{Cl}(1)=8.6-$ (8), $\mathrm{C}(33)-\mathrm{Cr}(2)-\mathrm{Cl}(1)=86.6(5), \mathrm{C}(33 \mathrm{~B})-\mathrm{Cr}(2)-\mathrm{Cl}(1 \mathrm{~A})=$ 85.8(7), $\mathrm{Cl}(1)-\mathrm{Cr}(2)-\mathrm{Cl}(1 \mathrm{~A})=94.0(2), \mathrm{C}(33 \mathrm{~B})-\mathrm{Cr}(2)-$ $\mathrm{P}(1)=92.4(8), \mathrm{C}(33)-\mathrm{Cr}(2)-\mathrm{P}(1)=88.9(5), \mathrm{Cl}(1)-\mathrm{Cr}(2)-$ $\mathrm{P}(1)=89.12(7), \mathrm{Cl}(1 \mathrm{~A})-\mathrm{Cr}(2)-\mathrm{P}(1)=94.3(2), \mathrm{Cr}(2)-\mathrm{P}(1)-$ $\mathrm{Cr}(1)=67.20(3), \mathrm{Cr}(1)-\mathrm{Cl}(1)-\mathrm{Cr}(2)=67.84(8), \mathrm{Cr}(2)-$ $\mathrm{Cl}(1 \mathrm{~A})-\mathrm{Cr}(1)=66.81(17), \mathrm{Cr}(1)-\mathrm{C}(33)-\mathrm{Cr}(2)=80.1(5)$, $\mathrm{Cr}(2)-\mathrm{C}(33 \mathrm{~B})-\mathrm{Cr}(1)=78.7(9)$.
triply bridged neutral species, containing three-center-four-electron methylene donors, give rise to shorter $\mathrm{Cr}-$ Cr distances than in the cationic species. In addition, variation in the $\mathrm{Cr}-\mathrm{Cr}$ distances among the triply bridged cations appears to reflect the covalent radii of the bridging atoms ( $\mathrm{Cl}>\mathrm{P}>\mathrm{Me}$ ). While the general synthetic methods described herein provide only moderate to low yields, suggesting alternate reaction pathways may be operative, efforts are continuing to devel op new synthetic strategies and to explore the chemistry of Cr phosphide complexes.
