Abstract: A facile and practical method for the deoxygenation of 4-alkoxy-2-butenoic acid moiety mediated by zinc is described to prepare multifunctional chiral building blocks from carbohydrates and tartaric acid.

INTRODUCTION

Though asymmetric synthesis began its domination in natural product synthesis, the relentless persuit of organic chemist for preparing optically pure building blocks via 'Chiron approach'^{1,2} still continues especially if these building blocks are obtained from naturally available carbohydrates, tartaric acid, amino acids, lactic acid etc., owing to abundance and cost efficiency. Our continued interest in the total synthesis of arachidonic acid lipoxygenation products such as leukotrienes^{3,4}, lipoxins^{3,4}, 5-HETE⁵, pheromones⁶ and others^{7,8} prompted us to study zinc mediated reductive deoxygenation of 4-alkoxy-2-butenoic acid moiety of the type 1a to yield deconjugated chiral allyl alcohol of the type 2a. A similar transformation was achieved by Kang *et al.*⁹ using more expensive and hazardous samarium diiodide, whereas a closely related work was also reported earlier using same reagent by Molander *et al.*¹⁰. The details of our findings are presented herein.

RESULTS AND DISCUSSION

At the first glance we intended to prepare a desired precursor starting from D-ribose. Accordingly Dribose on treatment with (carbethoxy methylene) triphenyl phosphorane in THF at reflux followed by acetonation (CuSO₄, H₂SO₄, Acetone) yielded the prerequisite γ -oxy, α , β unsaturated ester **1a** (scheme 1). This substrate underwent a very facile reductive elimination process (REP) in refluxing ethanolic Zn dust

(activated)¹¹ producing δ -hydroxy, β , γ unsaturated ester **2a** in 85% yield. The newly positioned olefin was found to have E-geometry based on ¹H NMR and ¹³C analysis (See experimental).

Reagents : (a) $Ph_{3}P = CH-COOEt$, $C_{6}H_{3}COOH$, THF, reflux¹²; (b) Acetone, $CuSO_{3}$, $H_{2}SO_{3}$; (c) Zn dust, EtOH, reflux. SCHEME 1

A plausible mechanism for the above reaction is shown in scheme 2. Accordingly^{10,13} metal (Zn) initially involves the supply of an electron to the double bond to generate radical anion which then undergoes concomitant reductive elimination of γ -oxy group via olefin migration. This then accepts another electron from Zn to give rise to enolate **6** which ultimately leads to desired product **2a**.

Taking advantage of the ready availability of sugars commercially, several substrates having γ , δ dioxy- α , β unsaturated esters were prepared using acetonation and Wittig olefination as primary reactions and subjected to the described transformation as shown in Table 1. The substrate 1c was prepared from D-xylose following the sequence described for D-ribose and 1b was prepared as delineated in Scheme 3.

Reagents : (a) Acetone, $CuSO_3$, H_2 , SO_3^{14} ; (b) $Ph_3P = CH-COOEt$, CH_3 , CN, $reflux^{15}$; (c) $(COCl)_2$, DMSO, Et_3N , $-78^{\circ}c$; (d) $Ph_3P = CH-COOEt$, C_6 , H_6 room temperature.

Reagents : (a) Acetone, $CuSO_4$, $H_2 SO_4^{(n)}$; (b) $Ph_3 P = CH-COOEt$, $C_6H_5 COOH$, THF, reflux. SCHEME 5

D-Glucose, the cheapest but the most important sugar, following literature procedure¹⁹ produced mixture of two compounds **12** and **13** which on separation followed by simple chemical transformations as represented in scheme 6 furnished **1f** and **1g** respectively.

Reagents: (a) $HgCl_2$, HgO, Acetone, H_1O_1 (b) $Ph_1P = CH-COOEt$, $C_{e}H_{e}$, room temperature; (c) Ac_2O_2 , $DMAP_2$, Et_1N_2 , DCM_2 : (d) NaH_2 , $C_{e}H_3$, CH_2 , Br_2 , THF_1 ; (e) $HgCl_2$, HgO_2 , Acetone, H_2O_2 ; (f) $Ph_2P = CH-COOEt$, $C_{e}H_{e}$, room temperature.

SCHEME 6

Alternatively only 1g could be obtained from δ -D-gluconolactone as shown in scheme 7.

Reagents : (a) Acetone, $CuSO_4$, H_2 , SO_4 ; (b) DIBAL, DCM, -78°; (c) $PH_3P = CH - COOEt$, THF, reflux; (d) $Ac_2O_2Et_3N$, DMAP, DCM.

SCHEME 7

All these chemodifferential substrates (1b-1g) under the described reaction conditions i.e., refluxing in ethanolic Zn conveniently yielded the deconjugated allyl alcohols (2b-2g) in excellent isolated yields (Table1). In all the cases, a single olefinic isomer was isolated from the reaction mixture. The key feature of this transformation is furanosoid (1b) and acetoxy (1d) group behaved identically like a dioxolane derivatives

CONCLUSION

We have demonstrated that reduction of a variety of functionalised α , β unsaturated γ , δ dioxy carboxylates with Zn provides a highly efficient route to substituted allyl alcohols. The mild and almost neutral reaction conditions allows no isomerisation of olefinic protons. The ready availability of substrates in large quantities makes it an interesting source for the synthesis of biologically important natural products having allylic alcohol functionality.

EXPERIMENTAL SECTION

IR spectrum were recorded as neat film on Perkin-Elmer 683 on 1310 spectrometers. ¹H NMR spectra were recorded by Varian Gemini spectrometer 200 MHz with CDCl, as solvent and TMS as internal standard. Mass spectra were recorded on either Micromass 7070 H or Finnigan Mat 1020 B mass spectrometer operating at 70 eV, molecular weights determined by CI technique, optical rotations were recorded by Jasco Dip-370 polarimeter and substrates were prepared by the literature procedures.

General procedure for the Deoxygenation of 4,5; 6,7-di-O-isopropylidene α , β unsaturated esters with Zn dust

Ethyl (E)-5-hydroxy-0-isopropylidene-3-heptenoate (2a)

To a stirred suspension of activated Zn dust (16.6 mmol, 5 eqv.) in dry ethanol (10 ml) under N₂ atmosphere, a solution of 4,5; 6,7-di-O-isopropyldene α , β unsaturated ester **1a** (0.47 g, 1.56 mmol) in dry ethanol (2 ml) was added and reflux for 12 h. After cooling it was filtered, solvent was removed under reduced pressure, the crude product was purified by SiO₂ column chromatography (eluent 20% ethyl acetate in hexane) to afford **2a** as a liquid product (0.347 g) in 91% yield. ¹ H NMR (CDCl₃, 200 MHz): δ 1.25 (t, 3H, J = 4.4 Hz); 1.35 (s, 3H); 1.45 (s, 3H); 3.0-3.1 (d, 2H, J=8.33 Hz); 3.85-4.3 (m, 6H); 5.5-5.65 (dd, 1H, J=6.25, 14.58 Hz); 5.8-6.0 (m, 1H, J=6.2, 8.9 MHz); IR (neat): 3480, 2990, 1730, 1670 cm⁻¹; MS : m/z 224 (M⁺); [α] $_{D}^{28}$ -15.5° (c 2.05, MeOH); Anal. calcd. for C₁₂ H₂₀ O₅ : C, 59.00; H, 8.25. Ethyl (E) - 5,6; 7,8 - di-O-isopropylidene-3-octenoate (2g)

With the general procedure above, the intermediate 1g (0.300 g, 0.806 mmol) was deoxygenated to provide 0.230 g (94%) of ethyl (E)-5,6; 7,8-di-O-isopropylidene-3-octenoate 2g which is same as 2d.

Ethyl (E) -4,5; 6,7-di-O-isopropylidene-2-heptenoate (1a).

A stirred mixture of D-ribose (5 g, 33.30 mmol), (carbethoxymethylene) triphenyl phosphorane (13.92 g, 39.96 mmol) and catalytic amount of benzoic acid in THF (100 ml) under N, atmosphere was heated under

reflux for overnight. The solvent was removed, 60 ml water was added to the syrup which precipitated triphenyl phosphine oxide. The precipitated was filtered and filtrate was washed with CHCl₃ (2 x 20 ml). The aq. layer was evaporated to give a syrup, the syrup was disolved in dry acetone (100 ml) containing 0.2% H_2SO_4 , anhydrous CuSO₄ (5 g) was added and stirred at room temperature for 20 h. The CuSO₄ was filtered off, washed thoroughly with small quantities of dry acetone and the filtrate rendered neutral by shaking with Ca(OH)₂ for 1h. The inorganic salts were removed by filtration and thoroughly washed with acetone. The combined filtrate was then evaporated to dryness under reduced pressure at a temperature not exceeding 40°c and residue was subjected to chromatographic purification (silica gel, 5% ethyl acetate in hexane) to afford **1a** (9.43 g) in 95% yield as denser liquid. ¹H NMR (CDCl₃, 200 MHz) : δ 1.25 (t, 3H, J=6.38 Hz); 1.33-1.4 (m, 6H); 1.45-1.5 (s, 3H); 3.8-4.29 (m, 6H); 4.79-4.87 (m, 1H); 6.05-6.18 (d, 1H, J = 14.79 Hz); 6.9-7.50 (dd, 1H, J=6.34, 14.73); IR (neat) : 2990, 1760, 1670 cm⁻¹; MS m/z 300 (M⁻); [α]_D²⁸ -23.40 (c 3.22, CHCl₃); Anal.calcd. for C₁₅ H₂₄ O₆; C, 59.98; H, 8.05. According to the literature procedure, D-glucose was converted to the compound **15** (0.300 g, 0.909 mmol) followed by acetylation with Ac₂O, DMAP, Et₄N to provide 0.334 g (99%) of ethyl (E)-4-acetoxy-5,6; 7,8 di-O-isopropylidene-2-octenoate (**1g**) as a liquid product after column chromatography (5% ethyl acetate in hexane). ¹H NMR (CDCl₃, 200 MHz) : δ 1.2-1.4 (m, 15H); 2.05 (s, 3H); 3.69 (t, 3H, J=7.11 Hz); 3.88-4.25 (m, 6H); 5.5-5.6 (m, 1H); 5.9-6.05 (d, 1H, J = 15.55 Hz); 6.82-6.90 (dd 1H, J = 6.6, 15.5 Hz); IR (neat) : 2990, 1730, 1670 cm⁻¹; MS m/z 372 (M⁺); $[\alpha]_D^{28}$ +15.06 (c 1.68, CHCl₃); Anal. Calcd. for C₁₈H₂₈O₈ : C, 58.05; H,7.85. Found : C, 58.04; H,7.40.

Ethyl (E)-4-hydroxy-5,6; 7,8 di-O-isopropylidene-2-octenoate (10)

According to the literature procedure, compound **9** (0.250 g, 0.748 mmol) was refluxed with HgCl₂, HgO, acetone, H₂O to provide 0.186 g (85%) of aldehyde, which on treated with Ph₃P = CH-COOEt (0.265 gm, 0.76, mmol) to get **10** (0.205 g) in 98% yield as a liquid product. ¹H NMR (CDCl₃, 200 MHz) : δ 1.2-1.5 (m, 15 H); 3.6-3.7.3 (m, 3H); 3.9-4.25 (m, 5H); 6.05-6.15 (d, 1H, J=15.62 Hz); 6.9-7.03 (dd, 1H, J=6.01, 15.62 Hz); IR (neat) : 3480, 2990, 1730, 1670 cm⁻¹; MS m/z 330 (M⁺); Anal. Calcd. for C₁₆ H₂₆ O, : C, 58.18; H, 7.87. Found : C, 58.15; H,7.85.

Ethyl (E)-4-hydroxy-5,6; 7,8-di-O-isopropylidene-2-octenoate (15)

The compound **15** was prepared same way as compound **10** but from D-glucose. ¹HNMR (CDCl₃, 200 MHz) : δ 1.2-1.45 (m, 15H); 2.78-2.90 (d, 1H, J=10 Hz); 3.65-3.76 (m, 1H); 3.87-4.23 (m, 6H); 4.36-4.5 (m, 1H); 6.0-6.15 (d, 1H, J=17.5 Hz); 6.94-7.09 (dd, 1H, J=6.01, 17.4 Hz); IR (neat) : 3480, 2990, 1760, 1670 cm⁻¹ ; MS m/z 330 (M⁺); [α]₀²⁸ -17.84 (c 3.206, CHCl₃). Anal. calcd. for C₁₆H₂₆O₇ : C, 58.17; H, 7.93. Found : C, 58.16: H, 7.85.

1,2; 3,4; 5,6 Tri-O-isopropylidene gluconoate (16)

Finely powered δ -D-gluconolactone (3 g., 16.85 mmol) was suspended in dry acetone (80 ml) containing 0.2% H₂SO₄, anhydrous CuSO₄ (3 g) was added and the mixture was shaken for 20 h at room temperature. After completion of the reaction, CuSO₄ was filtered off and filterate was neutralised by shaking with Ca(OH), for 1 h. The CaSO₄ and excess Ca(OH)₂ were removed by filtration, the filtrate was evaporated under reduced pressure and residue was purified by column chromatography (silica gel; 10% ethyl acetate in hexane) gave acetonide product 4.79 gm (90%) of compound **16** as a crystalline solid m.p. 115°c. ¹HNMR (CDCl₃, 200 MHz) : δ 1.33 (s, 3H); 1.35-1.45 (m, 9H); 1.59 (s, 3H); 1.65 (s, 3H); 3.85-4.3 (m, 5H); 4.55-4.60 (m, 1H); IR (neat) : 2990, 1760 cm⁻¹; MS m/z 316 (M⁺); $[\alpha]_{D}^{28}$ +34.76 (c 2.34, CHCl₃); Anal. Calcd. for C₁₅ H₂₄O₇ : C, 56.95; H,7.65. Found : C, 56.95; H,7.55.

Ethyl (E)-4-hydroxy-5,6; 7,8-di-O-isopropylidene-2-octenoate (15).

A solution of DIBAL-H (0.74 g, 5.21 mmol) was added dropwise over 30 min to a solution of 16 (1.5 g, 4.74 mmol) in dry DCM (50 ml) at -78°c under an argon atmosphere. After 30 min. resultant solution was quenched with saturated sodium potassium tartarate and was extracted with ether. The solvent was removed by reduced pressure to afford 1.28 g (85%) of alcohol compound, which on treated with Ph₃P =CH-COOEt (1.68 g, 4.83 mmol) to provide 15 (1.26 g) in 95% yield as a liquid product.
