Abstract

An effective synthesis of various azapyrenes from phenalenes and their dihydro derivatives has been developed using 1,3,5-triazines in polyphosphoric acid (PPA).

Keywords: Phenalenes; 1,3,5-Triazines; Polyphosphoric acid; Azapyrenes; *Peri*-Annellation

It is well known that 1,3,5-triazine can undergo ring cleavage upon treatment with nucleophilic reagents and serve as a formyl group precursor. This property has been extensively used in organic synthesis. Thus formamides,^{1a} perimides,^{1b} benzimidazoles,^{1b} benzothiazoles,^{1b} benzoxazoles,^{1b} purines,^{1b} pyridines,^{1c,d} pyrimidines,^{1c,e,f} and [1,6]naphthyridines^{1g-i} have been obtained utilizing different nucleophiles in reactions with 1,3,5-triazine (**1a**).

In the case of 1,3-binucleophiles, two aza-formyl groups of 1,3,5-triazine (**1a**) are involved in the reaction (Scheme 1). As a result of cyclization, a new six-membered ring is formed.

Currently, there exist four examples of 1,3,5-triazine reactions with 1,3-binucleophiles: syntheses of substituted triazines,^{2a} 4-aminopyridines,^{2b} 4-hydroxypyridines,^{2c} and pyrimidines^{1c} (Scheme 2). The common drawback of these methods is that they are limited to 1,3,5-triazine (**1a**) itself.

On the basis of the mechanism shown in Scheme 1, we presumed that 1,3,5-triazine would be a suitable reagent for *peri*-annellation of the $[c,d]$ pyridine nucleus of aza-phenalenes (X = Y = phenalenes *peri*-positions).

Scheme 1. Mechanism of the reaction of 1,3,5-triazine (**1a**) with 1,3-binucleophiles.

We chose the transformation of perimides **2** to 1,3,7-triazapyrenes **3** as a test reaction. However, the reaction did not occur utilizing the conditions (HCl/MeCN or EtONa/EtOH) described in the above mentioned reports.² Therefore, we used PPA as a non-nucleophilic acid catalyst. Pleasingly, heating perimides **2** with a 1.5-M excess of 1,3,5-triazines **1a–c** in the medium of PPA³ (~3 g) yielded the previously unknown 1,3,7-triazapyrenes **3a–f** (Scheme 3, Table 1).⁴

Scheme 2. Known reactions of 1,3,5-triazine (**1a**) with 1,3-binucleophiles.Table 1
Synthesis of 1,3,7-triazapyrenes

Entry	R	R'	Product	Yield (%)
1	H (2a)	H (1a)	3a	63
2	Me (2b)	H (1a)	3b	55
3	Ph (2c)	H (1a)	3c	56
4	H (2a)	Me (1b)	3d	71
5	Me (2b)	Me (1b)	3e	52
6	H (2a)	Ph (1c)	3f	78

In a similar way the reaction proceeded with 1*H*-naphtho[1,8-*de*][1,2,3]triazine (1,2,3-triazaphenalene, **4**) (Scheme 4). The yield of the previously unknown product 1,2,3,7-tetraazapyrene (**5**) was 68%.

Using the mechanism in Scheme 1, we further hypothesized that the reaction should be applicable to dihydrophenalenes and dihydroazaphenalenes. For the formation of azapyrenes an additional dehydrogenation step would be required. Indeed, heating dihydrophenalenes **6** and **7** in PPA gave rise to the corresponding 2-azapyrene (**10**)⁴ and 2,7-diazapyrene (**11**)⁴ in 74% and 55% yields, respectively. Presumably, intermediates **8** and **9** undergo spontaneous dehydrogenation during the reaction (Scheme 5).

Table 2
Conditions for azapyrene syntheses

Product	Temperature (°C)	Reaction time (h)
3a	100	1.5
3b	100	1.5
3c	100	1.5
3d	140	1.5
3e	140	1.5
3f	180	1.5
5	60 and then 100	1 and 3
10	100 and then 140	2 and 3
11	100 and then 140	2 and 3

In conclusion, the advantages of the method described for [*c,d*]pyridine cycle *peri*-annulation include reagent availability, experimental simplicity and its applicability to the synthesis of a broad range of substituted triazapyrenes.

 3. PPA containing 86% P₂O₅ was used; preparation according to: Uhlig, F. *Angew. Chem.* **1954**, 66, 435.
 4. **General procedure:** a mixture of compounds **2**, **4**, **6**, or **7** (1 mmol), corresponding 1,3,5-triazine (**1a–c**) (1.5 mmol), and PPA (2–3 g) was stirred under conditions according to Table 2. After cooling to 80–85 °C, the reaction mixture was poured into cold water (25 ml) with vigorous stirring and ammonia was added to pH ~ 8. The precipitate was filtered off, washed with water, and dried. Compounds **3**, **10**, and **11** were purified by recrystallization. Compound **5** was purified by flash chromatography on silica gel, eluting with ethyl acetate.
