We report here the synthesis of D- and L-myo-inositol 1,2,4,6-tetrakisphosphate **3a** and **3b** and the racemic modification **3ab**. Racemic *myo*-inositol 1,2,4,6-tetrakisphosphate **3ab** was synthesised from DL-1,2,4,6-tetra-O-allylmyo-inositol 9ab. Benzylation and de-allylation provided the tetraol 11ab, which was phosphitylated in the presence of bis(benzyloxy)diisopropylaminophosphine and 1*H*-tetrazole, then oxidised to give the fully protected 1,2,4,6tetrakisphosphate 13ab. Hydrogenolysis of 13ab and purification of product by ion exchange chromatography gave racemic myo-inositol 1,2,4,6-tetrakisphosphate 3ab, which showed no demonstrable agonism or antagonism for  $Ca^{2+}$  release at 200  $\mu$ M in permeabilised hepatocytes. The chiral derivatives, D-**3a** and L-myo-inositol 1,2,4,6tetrakisphosphate **3b** were synthesised from 5-O-benzyl-1,4,6-tri-O-p-methoxybenzyl-mvo-inositol **19ab**, which was resolved using R-(-)-O-acetylmandelic acid providing two diastereoisomers 21 and 22 which were separated and deacylated to give the corresponding enantiomers. Further transformations gave the corresponding chiral 1,2,4,6tetraols which were phosphitylated, oxidised, deprotected and purified as for the racemic mixture. The enantiomeric tetrakisphosphates 3a and 3b were evaluated for inhibition of the metabolic enzymes inositol 1,4,5-trisphosphate 5-phosphatase and 3-kinase in comparison with the enantiomers of another synthetic regioisomer D- and L-myoinositol 1,2,4,5-tetrakisphosphate. Both D- and L-myo-inositol 1,2,4,6-tetrakisphosphate inhibit 5-phosphatase with an IC<sub>50</sub> value of 3.8 µM and 14 µM, repectively. However, both enantiomers were poorly recognised by the 3-kinase enzyme, with IC<sub>50</sub> values greater than 100  $\mu$ M. The enantiomers of the 1,2,4,5-tetrakisphosphate showed the same relative pattern of activity towards the two enzymes but were more potent against 5-phosphatase (0.47  $\mu$ M and 3  $\mu$ M respectively).

### Introduction

D-myo-Inositol 1,4,5-trisphosphate [Ins(1,4,5)P<sub>3</sub> 1a] (Fig. 1) is a ubiquitous hydrophilic second messenger, which elevates the levels of cytostolic  $Ca^{2+}$  ions.<sup>1</sup> After  $Ca^{2+}$  release, Ins(1,4,5)P<sub>3</sub> is deactivated and the cell returns to a basal state. This is achieved in two ways: first, an Ins(1,4,5)P<sub>3</sub> 5-phosphatase removes the 5-phosphate group from Ins(1,4,5)P<sub>3</sub> to give *myo*-inositol 1,4-bisphosphate [Ins(1,4)P<sub>2</sub>] which does not release  $Ca^{2+}$ . Ins(1,4)P<sub>2</sub> is an allosteric activator of 6-phosphofructo-1-kinase<sup>2</sup> and also activates DNA polymerase- $\alpha$ .<sup>3</sup> Second, Ins(1,4,5)P<sub>3</sub> can be phosphorylated by an Ins(1,4,5)P<sub>3</sub> 3-kinase to give

Fig. 1		

*myo*-inositol 1,3,4,5-tetrakisphosphate [Ins(1,3,4,5)P<sub>4</sub> **2a**] which acts as a potent bi-modal regulator of cellular sensitivity to Ins(1,4,5)P<sub>3</sub> and facilitates the regulation of Ca<sup>2+</sup> signalling.<sup>4</sup> Thus, both products may be regarded as 'off' signals. The function of Ins(1,3,4,5)P<sub>4</sub> has not been fully resolved; however, it could be the natural inhibitor of 5-phosphatase *in vivo*.<sup>4</sup> Studies have shown that D-Ins(1,3,4,5)P<sub>4</sub> is the most potent inhibitor of 5-phosphatase<sup>4</sup> (IC<sub>50</sub> of 0.15  $\mu$ M). However, the enantiomer of **2a** L-Ins(1,3,4,5)P<sub>4</sub> **2b** is more than ten-fold weaker (IC<sub>50</sub> of 1.8  $\mu$ M).<sup>4</sup> These data support the finding that 5-phosphatase is inhibited by a number of tetrakisphosphates.<sup>5</sup> However, there are no known inhibitors which are as potent as D-Ins(1,3,4,5)P<sub>4</sub>.

We have previously described<sup>6</sup> how *myo*-inositol 1,4,6-trisphosphate,  $[Ins(1,4,6)P_3, 4a]$  can mimic the Ca<sup>2+</sup> releasing activity of Ins(1,4,5)P<sub>3</sub>, by spatial inversion and rotation of the former molecule, such that positions 4-, 1- and 6- of Ins(1,4,6)P<sub>3</sub> (Fig. 2) can be superimposed on positions 1-, 4- and 5- of Ins(1,4,5)P<sub>3</sub> respectively. The hydroxyl groups at positions 3- and 2- of Ins(1,4,6)P<sub>3</sub>, can be superimposed on positions 2- and 3- of Ins(1,4,5)P<sub>3</sub> respectively, but the stereochemistry at these sites is inverted. Ins(1,4,6)P<sub>3</sub> can release Ca<sup>2+</sup> from intracellular stores, albeit with reduced potency compared to Ins(1,4,5)P<sub>3</sub>. Since Ins(1,4,6)P<sub>3</sub> can be superimposed on

DOI: 10.1039/b302986g

Ins(1,4,5)P<sub>3</sub>, the phosphates and hydroxyl groups of Ins-(1,2,4,6)P<sub>4</sub> 3a can also, in principle, be arranged in a pattern which broadly overlaps with  $Ins(1,3,4,5)P_4 2a$ , by spatially inverting and rotating the molecule (Fig. 3). The tetrakisphosphate 3a has a similar arrangement of phosphates as compound 2a; however, where the 3-phosphate of Ins(1,3,4,5)P<sub>4</sub> 2a is equatorial, the corresponding position of 3a is axial and the equivalent position-2 is now equatorial. Similarly, if the enantiomer L-Ins(1,2,4,6)P<sub>4</sub> **3b** is inverted and rotated in the same way, the new 5-position (axial 2-phosphate) of 3b corresponding to the phosphate of **2a** is axial and the 3-position is equatorial and **3b** can be superimposed on D-Ins $(1,3,4,5)P_4$  2a. The other three phosphates are equatorial at pseudo positions 1-, 3- and 4- (Fig. 3). Thus, both D-Ins(1,2,4,6)P<sub>4</sub> 3a and L-Ins(1,2,4,6)P<sub>4</sub> 3b can be superimposed on D-Ins $(1,3,4,5)P_4$  with an axial phosphate group at position-3 for 3a or at position-5 for 3b. We report here the synthesis of D- and L-myo-inositol 1,2,4,6-tetrakisphosphate and its racemic mixture, and the biological evaluation of compounds 3a and 3b and  $Ins(1,3,4,5)P_4$  2a, together with another tetrakisphosphate enantiomeric pair D-Ins $(1,2,4,5)P_4$ **5a** and L-Ins(1,2,4,5)P<sub>4</sub> **5b**, with the metabolic enzymes, Ins(1,4,5)P<sub>3</sub> 3-kinase and 5-phosphatase.

# **Results and discussion**

myo-Inositol orthoformate 6 (Scheme 1) was prepared according to Vasella and co-workers<sup>7</sup> in 73% yield to give a highly crystalline compound. Allylation of the two axial and one equatorial hydroxyl groups was accomplished using sodium hydride and allyl bromide in dry DMF at room temperature. Purification of the crude product by flash chromatography provided the meso- compound 2,4,6-tri-O-allyl-myo-inositol orthoformate 7 as a syrup in 89% yield. The orthorformate protective group was then removed from compound 7 by acid hydrolysis using aq. HCl at reflux temperature to afford 2,4,6-tri-O-allylmyo-inositol 8 in excellent yield. When the orthoformate protecting group was removed from compound 7, the hydroxyl groups at positions 1-, 3- and 5- were exposed. Under these conditions it was possible to allylate selectively the more reactive 1- or 3-hydroxyl position and provide a tetra-O-allyl derivative that was used to prepare racemic  $Ins(1,2,4,6)P_4$  **3ab**. Monoallylation of the triol 8 to give the tetra-O-allyl derivative 9ab was envisaged because the starting material was water soluble, however, the product was soluble in the organic layer. Thus, monoallylation would release tetra-O-allyl-mvo-inositol 9ab into the organic layer and move the equilibrium in favour of the monoallylated product. Selective allylation of the triol 8 was achieved under phase-transfer conditions,<sup>8</sup> using tetrabutylammonium sulfate and allyl bromide in a 5% aqueous solution of sodium hydroxide and an equal volume of dichloromethane at reflux temperature for 24 h. Racemic 1,2,4,6-tetra-O-allyl-myo-inositol 9ab was isolated in 74% yield

Scheme 1 Synthesis of racemic Ins $(1,2,4,6)P_4$ . Reagents and conditions (i) NaH, AllBr, DMF, rt, 3 h, (89%); (ii) ethanol–1 mol dm<sup>-3</sup> aq. HCl (2 : 1), reflux 3 h, (93%); (iii) AllBr, (Bu<sub>4</sub>N)<sub>2</sub>SO<sub>4</sub>, (1 eq.), CH<sub>2</sub>Cl<sub>2</sub>–5% aq. NaOH, 1 : 1, reflux 24 h, (74%); (iv) NaH, BnBr, DMF, (88%); (v) 10% Pd/C, *p*-toluene sulfonic acid, MeOH–H<sub>2</sub>O (5 : 1), reflux, (49%); (vi) (BnO)<sub>2</sub>PNPr'<sub>2</sub>, 1*H*-tetrazole, CH<sub>2</sub>Cl<sub>2</sub>; (vii) MCPBA (50–60%), 0 °C, 30 min, (91%); (viii) H<sub>2</sub>, Pd/C, MeOH–H<sub>2</sub>O (4 : 1), 20 h, then purification by ion exchange chromatography on Q-Sepharose Fast Flow, (33%).

as a syrup, since selective allylation at positions C-1-OH or C-3-OH leads to the same racemic product 9ab. Penta-O-allyl-myoinositol together with starting material were observed by TLC, but these compounds were not isolated after chromatography. Benzylation of diol 9ab with benzyl bromide and sodium hydride in DMF provided the fully blocked compound DL-1,2,4,6-tetra-O-allyl-3,5-di-O-benzyl-myo-inositol 10ab. Removal of all four allyl protective groups was achieved using 10% palladium on carbon in the presence of an acid to provide the racemic 1,2,4,6-tetraol 11ab. Compound 11ab was subjected to phosphitylation using the P(III) reagent bis-(benzyloxy)(diisopropylamino)phosphine<sup>9</sup> ( $\delta_{\mathbf{p}} = +147.9$  ppm) in the presence of excess 1H-tetrazole. The reaction of the P(III) reagent in the presence of 1H-tetrazole provided a reactive tetrazolide intermediate ( $\delta_{\mathbf{P}} = +126.73 \text{ ppm}$ ).<sup>10</sup> The tetraol **11ab** was added to the tetrazolide derivative to provide a tetrakisphosphite intermediate 12ab. The <sup>31</sup>P NMR spectrum of the 1,2,4,6-tetrakisphosphite 12ab, operating at 36.2 MHz, and a sweep width of 2500 KHz, showed eight assignable peaks derived from several  ${}^{5}J_{pp}$  coupling systems.<sup>10</sup> There was a doublet at  $\delta_{p} = 139.0$  ppm, for 2-P,  ${}^{5}J_{pp} = 2.4$  Hz; a doublet of doublets at  $\delta_{p} = 140$  ppm for 1-P,  ${}^{5}J_{pp} = 4.3$  and 2.4 Hz; a doublet at 142.5 ppm for 6-P,  ${}^{5}J_{pp} = 4.3$  Hz, and a singlet at  $\delta_{p} = 141.8$  ppm for 4-P. This was definitive proof that phase  $\delta_{\rm P}$  = 141.8 ppm for 4-P. This was definitive proof that phosphitylation of the three adjacent positions and the isolated C-4-OH had occurred. The reaction mixture was then cooled and oxidised using m-chloroperoxybenzoic acid (MCPBA) to give the P(v) fully protected phosphotriester 13ab in excellent yield. After oxidation, there is no  ${}^{5}J_{pp}$  coupling, thus, the pattern of the  ${}^{31}P$  NMR spectrum gives four separate phosphorus singlets at ca. -1 to -3 ppm for the <sup>31</sup>P-<sup>1</sup>H decoupled NMR spectrum. The decabenzyl derivative 13ab was hydrogenolysed under pressure, in the presence of 10% palladium on carbon. The solid components of the reaction mixture were filtered off over a bed of Celite and the methanolic-aqueous solution was evaporated to give a syrup. The crude compound was dissolved in MilliQ and purified by ion-exchange chromatography on Q-Sepharose Fast Flow using a gradient of triethylammonium hydrogen carbonate (TEAB) buffer. Pure Ins(1,2,4,6)P<sub>4</sub> **3ab** was obtained as the triethylammonium salt after ion exchange chromatography, and eluted at *ca.* 800 mmol dm<sup>-3</sup> TEAB buffer and was quantified by phosphate analysis.<sup>11</sup>

A different approach was used to synthesise the chiral antipodes, 3a and 3b (Scheme 2). Racemic 5-O-benzyl-1,4,6-tris-O-(p-methoxybenzyl)-myo-inositol 19ab was resolved using the chiral auxillary (R)-(-)-O-acetylmandelic acid 20 in order to give suitable intermediates for the preparation of the tetrakisphosphates 4a and 4b. Intermediate 19ab was prepared in three steps from the *trans* diol 14ab,<sup>12</sup> which was selectively alkylated, at the more reactive C-6-OH.<sup>13</sup> Thus, treatment of diol 14ab with dibutyltin oxide, tetrabutylammonium bromide/ iodide and *p*-methoxybenzyl chloride in acetonitrile resulted in three products in an approximate ratio of (8:4:1) for compounds 16ab, 15ab and 17ab. The <sup>1</sup>H NMR spectrum of 16ab showed a broad triplet at  $\delta = 3.32$  ppm for 5-H, which was the signal for the ring proton furthest upfield. Following D<sub>2</sub>O exchange, the broad triplet at  $\delta = 3.32$  ppm collapsed to give a sharp triplet, however, the D<sub>2</sub>O exchange had no effect on the signal for 6-H or 4-H. The other products, 2,3-O-isopropylidene-1,4,5-tris-O-p-methoxybenzyl-myo-inositol 15ab and 2,3-O-isopropylidene-1,4,5,6-tetrakis-O-p-methoxybenzyl-myoinositol 17ab were isolated in 26% and 6% yield respectively. 5-O-benzyl-1,4,6-tris-O-p-methoxybenzyl-myo-ino-Racemic sitol 19ab was prepared by benzylation of compound 16ab to give 18ab and careful acid hydrolysis of the isopropylidene gave the cis-diol 19ab.

Numerous methods are available to resolve myo-inositol phosphate precursors;<sup>14</sup> most of these procedures use a chiral auxiliary such as an acid, that is coupled to one or more of the hydroxyl groups on the myo-inositol ring to form a pair of diastereoisomeric ester derivatives. The resulting two diastereoisomers can be separated by flash chromatography or crystallisation.<sup>10,13,14</sup> Ogawa and co-workers<sup>15,16</sup> have used (S)-(+)-O-acetylmandelic acid coupled to DL-1,4,5,6-tetra-Obenzyl-mvo-inositol<sup>15</sup> to then provide precursors to previously inaccessible hexoses,<sup>15</sup> and  $\beta$ -glucosidase and  $\alpha$ -mannosidase inhibitors (+)- and (-)-norjirimycin.<sup>16</sup> They also used (R)-(-)-O-acetylmandelic acid to acylate aminocyclopentane-1,2,3,4tetraols<sup>17</sup> which were then used to synthesise (+) and (-)-mannostatin A. The previous success of this reagent for resolving racemic myo-inositol derivatives containing a free cis-diol, prompted us to use it as our reagent of choice. The cis-diol DL-5-O-benzyl-1,4,6-tris-O-(p-methoxybenzyl)-myo-inositol 19ab was resolved by coupling to (R)-(-)-O-acetylmandelic acid 20, in the presence of DCCI and DMAP at -20 °C in order to form two equatorial substituted diastereoisomers 21 and 22. We used the R-enantiomer of acetylmandelic acid, because from previous resolutions<sup>10,13</sup> we predicted the less polar product (by TLC) would lead to the D-enantiomer 3a and the more polar product should give the L-enantiomer 3b. The critical resolution step in this synthesis gave diastereoisomers 21 and 22, which had  $R_{\rm f}$  values of 0.34 and 0.24 respectively in our TLC system (CHCl<sub>3</sub>-acetone 15:1). Separation and purification of the two diastereoisomers was then accomplished using flash chromatography and crystallisation. In the NMR spectrum, the 1-H proton from both diastereoisomers could not be identified due to the methylene AB coupling pattern of a benzyl or p-methoxybenzyl moiety which obscured the doublet of doublet signal for 1-H in both compounds. However, it was shifted downfield due to the carbonyl deshielding effect from the ester. The slower running diastereoisomer showed an unusual upfield shift of a methylene AB system from the adjacent p-methoxy-

Scheme 2 Synthesis of D- and L-Ins(1,2,4,6)P<sub>4</sub>. Reagents and conditions (i) Bu<sub>2</sub>SnO, CH<sub>3</sub>CN, (Bu)<sub>4</sub>NBr and (Bu)<sub>4</sub>NI, *p*-methoxybenzyl chloride, Soxhlet, reflux 40 h, (46% 16ab, 26% 15ab, 6% 17ab); (ii) BnBr, NaH, DMF, 2 h, (86%); (iii) MeOH–1.0 mol dm<sup>-3</sup> aq. HCl (9:1), 50 °C, 30 min, (79%); (iv) (*R*)-(-)-O-acetylmandelic acid, DMAP, DCCI, -20 °C, overnight, (32% 21, 26% 22); (v) MeOH–NaOH, reflux, 30 min, (96% 19a, 99% 19b); (vi) Bu<sub>2</sub>SnO, PhCH<sub>3</sub>, Dean-and-Stark apparatus, 3 h. Then DMF, CsF, BnBr, rt, overnight, (83% 23a, 95% 23b); (vii) 1 Mol dm<sup>-3</sup> aq. HCl-ethanol (1:2) reflux, 4 h, (92% 11a, 93% 11b); (viii) (BnO)<sub>2</sub>PNPr<sup>i</sup><sub>2</sub>, 1*H*-tetrazole, CH<sub>2</sub>Cl<sub>2</sub>, 10 min, then add tetraols, 10 min, then add (50–60%) MCPBA, 0 °C, 30 min, (79% 13a, 86% 13b); (ix) 10% Pd/C, H<sub>2</sub>, MeOH–H<sub>2</sub>O (4:1), 20 h, then purification by ion exchange chromatography on Q-Sepharose Fast Flow, (65% 4a, 36% 4b).

benzyl moiety at  $\delta = 4.05$  and 4.36. The *myo*-inositol ring protons at position (2-H) for both diastereoisomers were identified, and their signal was indicative of unacylated products and the equatorial C-1-OH was acylated under our experimental conditions. The unique singlet at  $\delta = 5.97$  for diastereoisomer **21** and  $\delta = 5.99$  for diastereoisomer **22** [for CH<sub>3</sub>CO<sub>2</sub>CH(Ph)CO<sub>2</sub>Ins] indicated the purity of these compounds. The individual diastereoisomers **21** and **22** were deacylated using methanolic sodium hydroxide to give the enantiomers **19a** and **19b** which

had equal and opposite optical rotations. The equatorial hydroxyl group was then selectively benzylated over the axial hydroxyl moiety via the cis-1,2-O-dibutylstannylene derivative which was formed by refluxing the individual enantiomers 19a and 19b separately, in the presence of dibutyltin oxide and toluene, with continuous removal of water. The cis-1,2-O-dibutylstannylene derivatives were dried then dissolved in dry DMF followed by the addition of three equivalents of caesium fluoride and the mixtures stirred under nitrogen. Benzyl bromide was added dropwise and the reactions were stirred overnight, after which a single product was obtained after work up and chromatography in each case to give the individual enantiomers 23a and 23b. The three *p*-methoxybenzyl groups were then removed in the presence of the benzyl ethers under acidic conditions, to give D- and L-3,5-di-O-benzyl-myo-inositol 11a and 11b respectively, which had equal and opposite optical rotations.

We firmly established the absolute configuration of D- and L-3,5-di-O-benzyl-myo-inositol 11a and 11b respectively, by transforming L-3,5-di-O-benzyl-1,4,6-tris-O-p-methoxybenzylmyo-inositol 23b to the known compound, L-2,3,5-tri-O-benzylmvo-inositol<sup>13</sup> 25b (Scheme 3). The 2-hydroxyl group of 23b was benzylated to give the fully blocked intermediate L-2,3,5tri-O-benzyl-1,4,6-tris-O-p-methoxybenzyl-myo-inositol 24b. The three *p*-methoxybenzyl groups were removed from 24b by acidic hydrolysis to give triol 25b and the melting point and optical rotation agreed well with our literature value.<sup>13</sup> The faster running compound (higher  $R_f$ ) by TLC led to the synthesis of D-3,5-di-O-benzyl-myo-inositol 11a and the slower running compound provided the L-3,5-di-O-benzyl-myoinositol 11b. Phosphorylation of the individual chiral tetraols was carried out in the same way as for the racemic mixture, using the P(III) approach and oxidation to P(v) intermediate using MCPBA. The benzyl protective groups for both fully protected tetrakisphosphate enantiomers 13a and 13b were then removed by hydrogenolysis in the presence of 10% palladium on carbon. The product was then purified on Q-Sepharose Fast Flow using a gradient of TEAB as buffer to give the corresponding pure tetrakisphosphates  $D-Ins(1,2,4,6)P_4$  3a and L-Ins $(1,2,4,6)P_4$  3b respectively. The specific rotations for the chiral antipodes 3a and 3b were determined in methanol and found to be -15.4 and +15 for **3a** and **3b** respectively. Recently, syntheses for compounds 3a and 3b have been reported by Chung et al.,18 using a different route. The magnitude and sign of the optical rotation for each enantiomer, agree fully with our data.

**Scheme 3** Determination of the absolute configuration of compound **23b**. *Reagents and conditions* (i) NaH, BnBr, DMF, rt, 2 h, (82%); (ii) 1 Mol dm<sup>-3</sup> aq. HCl–ethanol (1 : 2), reflux 4 h, (88%).

Compounds D- and L-Ins(1,2,4,6)P<sub>4</sub> (**3a** and **3b**), which are structurally similar to *myo*-inositol 1,3,4,5-tetrakisphosphate **2a** (see Fig. 3), were evaluated in the presence of the Ins(1,4,5)P<sub>3</sub> metabolising enzymes, 5-phosphatase (type I from human brain)<sup>19</sup> and 3-kinase (type A, from rat brain, clone C5).<sup>20</sup> For a complete study, several other structurally related inositol tetrakisphosphates were evaluated under the same

experimental conditions: these included the naturally occurring D-Ins $(1,3,4,5)P_4$  **2a** together with the synthetic regioisomers D-Ins $(1,2,4,5)P_4$  **5a** and L-Ins $(1,2,4,5)P_4$  **5b**, which differ in the position of one phosphate.<sup>10</sup> This study is the first evaluation of D- and L-Ins $(1,2,4,6)P_4$  and D- and L-Ins $(1,2,4,5)P_4$  as potential inhibitors of 3-kinase and 5-phosphatase.

Initial studies for synthesising new analogues derived from Ins(1,4,5)P<sub>3</sub> focused on the analogue<sup>5</sup> L-chiro-Ins(2,3,5)P<sub>3</sub> (26 in Fig. 4) which interacts with the  $Ins(1,4,5)P_3$  receptor and deactivating enzymes, 3-kinase and 5-phosphatase. This molecule is similar to  $Ins(1,4,5)P_3$  but the position-3 of  $Ins(1,4,5)P_3$ is now axial and the name and numbering of the resulting inositol phosphate derivative changes. L-chiro-Ins(2,3,5)P, 26 is a full agonist for Ca<sup>2+</sup> release and inhibits both 5-phosphatase ( $K_i$  value of 7.7  $\mu$ M), [ $K_m$  for Ins(1,4,5)P\_3 is 13.8  $\mu$ M] and 3-kinase ( $K_i$  value of 0.97  $\mu$ M), [ $K_m$  value for Ins(1,4,5)P\_3 is 0.85 µM].<sup>5</sup> It was a direct lead to Ins(1,4,6)P<sub>3</sub> 4a where the axial hydroxyl group of L-chiro-Ins(2,3,5)P<sub>3</sub> 26, corresponding to position-2 of Ins(1,4,5)P<sub>3</sub>, is now equatorial. Ins(1,4,6)P<sub>3</sub> 4a is a full agonist for Ca<sup>2+</sup> release<sup>6</sup> and only 2-fold less potent than Ins(1,4,5)P<sub>3</sub> in permeabilised platelets. An enzyme study by Hirata et al.<sup>21</sup> demonstrated that Ins(1,4,6)P<sub>3</sub> 4a is resistant to 5-phosphatase [K<sub>i</sub> value 9.2  $\mu$ M, (cf Ins(1,4,5)P<sub>3</sub>, K<sub>i</sub> value 15.9  $\mu$ M)]<sup>†</sup> and a potent 3-kinase inhibitor: IC<sub>50</sub> value of 2  $\mu$ M (approx.) in the presence of 30  $\mu$ M Ca<sup>2+</sup> and 8  $\mu$ M at < 0.01  $\mu$ M Ca<sup>2+</sup>. This work shows that the hydroxyl orientation at position-2 of Ins(1,4,5)P<sub>3</sub> is not significant for 3-kinase recognition. However, inverting the stereochemistry at position-3 of  $Ins(1,4,5)P_3$  to give L-chiro-Ins(2,3,5)P\_3, delivers a potent 3-kinase and 5-phosphatase inhibitor and a molecule which retains Ca2+ releasing properties when it binds to the Ins(1,4,5)P<sub>3</sub> receptor.

Fig. 4 Modifications of positions 2- and 3- around a D-1,4,5-trisphosphate environment.

The addition of a phosphate group at the equatorial position-3 of  $Ins(1,4,5)P_3$  gives  $Ins(1,3,4,5)P_4$  **2a**, the most potent 5-phosphatase inhibitor (albeit a co-substrate,  $IC_{50}$  value of  $0.15 \,\mu$ M).<sup>4</sup> Kozikowski *et al.*<sup>23</sup> synthesised L-*chiro*-Ins(1,2,3,5)P\_4 **27** which is an analogue of  $Ins(1,3,4,5)P_4$  in which a phosphate has been substituted at position-1 of **26** to give tetrakisphosphate **27**, resulting in a significant reduction in Ca<sup>2+</sup> release for **27**, which is 700-fold less potent than  $Ins(1,4,5)P_3$  at binding to the  $Ins(1,4,5)P_3$  receptor. In this respect, **27** is similar to  $Ins(1,3,4,5)P_4$  **2a** in its Ca<sup>2+</sup> releasing properties.<sup>4</sup>  $Ins(1,3,4,5)P_4$ 

<sup>†</sup> IC<sub>50</sub> is the concentration of agent inhibiting the enzyme activity by 50% at 1  $\mu$ M substrate concentration. In these experiments, inhibiting the phosphorylation of [<sup>3</sup>H] Ins(1,4,5)P<sub>3</sub>.  $K_i$  is the dissociation constant for an enzyme–inhibitor complex calculated from IC<sub>50</sub> values, using the Cheng and Prusoff equation.<sup>22</sup>

Table 1IC

Compound	Recombinant Ins $(1,4,5)P_3$ 5-phosphatase from human brain IC <sub>50</sub> / $\mu$ M	Recombinant 3-kinase-A from rat brain IC <sub>50</sub> /µM
D-Ins(1,3,4,5)P <sub>4</sub> 2a	0.19	1.4
D-Ins(1,2,4,6)P <sub>4</sub> 4a	3.8	>100
L-Ins(1,2,4,6)P <sub>4</sub> 4b	14	>>100
$D-Ins(1,2,4,5)P_4$ 5a	0.47	>100
L-Ins(1,2,4,5)P <sub>4</sub> 5b	3	>>100

**2a** has been evaluated for  $Ca^{2+}$  release and the inhibition of 3kinase. Some literature (Pollokoff et al.<sup>24</sup> and Gawler et al.<sup>25</sup>) indicates that it releases Ca<sup>2+</sup> from intracellular stores, but Bird and Putney Jr.<sup>26</sup> demonstrated that Ins(1,3,4,5)P<sub>4</sub> was ineffective at mobilising Ca<sup>2+</sup>: the older literature studies probably used  $Ins(1,3,4,5)P_4$  contaminated with small quantities of  $Ins(1,4,5)P_3$ . Only a small number of groups have evaluated racemic Ins(1,3,4,5)P<sub>4</sub> against 3-kinase. They found it was a poor inhibitor of the enzyme with  $IC_{50}$  values of 90  $\mu M^{\,24}$  and 220 µM.<sup>27</sup> However, in our experiments, (Table 1 and Fig. 5) D-Ins(1,3,4,5)P<sub>4</sub> 2a was a potent 3-kinase inhibitor (type-A, from rat brain, clone C5), with an  $IC_{50}$  value of 1.4  $\mu$ M. This may result from the use of recombinant enzyme, different assay conditions or the use of other Ins(1,4,5)P<sub>3</sub> 3-kinase isoenzymes. Moreover, evaluating inositol phosphate analogues in crude lysates may lead to degradation of some compounds due to  $Ins(1,4,5)P_3$  5-phosphatase activity in the assay. The fact that  $Ins(1,3,4,5)P_4$  is an inhibitor of  $Ins(1,4,5)P_3$  3-kinase is not surprising and probably results from product inhibition derived from our assay conditions.

# Type I Ins(1,4,5)P<sub>3</sub> 5-phosphatase

Fig. 5 The curves illustrate the inhibition of recombinant Ins(1,4,5)P<sub>3</sub> 5-phosphatase from human brain by Ins(1,3,4,5)P<sub>4</sub>, D- and L-Ins(1,2,4,6)P<sub>4</sub> and D- and L-Ins(1,2,4,5)P<sub>4</sub> in the presence of 1  $\mu$ M Ins(1,4,5)P<sub>3</sub>.

Using similar reasoning for the synthesis of Ins(1,4,6)P<sub>3</sub> derived from Ins(1,4,5)P<sub>3</sub> and L-chiro-Ins(2,3,5)P<sub>3</sub>, addition of a phosphate at position-2 of Ins(1,4,6)P<sub>3</sub> would deliver Ins(1,2,4,6)P<sub>4</sub>, a regioisomer of Ins(1,3,4,5)P<sub>4</sub>. The axial 2-phosphate of  $Ins(1,2,4,6)P_4$  can be superimposed on the 3-position of  $Ins(1,3,4,5)P_4$  and the axial 2-hydroxyl of  $Ins(1,3,4,5)P_4$  and the 3-hydroxyl in  $Ins(1,2,4,6)P_4$  are equatorial (see Fig. 3): the L-enantiomer was also synthesised and evaluated. Examination of structures 1a, 3a and 3b (Fig. 1) illustrates that, should DL-Ins(1,2,4,6)P<sub>4</sub> possess Ins(1,4,5)P<sub>3</sub>like Ca<sup>2+</sup> mobilising activity, we would expect activity to reside only in the D-enantiomer as for the Ins(1,4,5)P<sub>3</sub> enantiomers.<sup>14</sup> We found that at a concentration of 200 µM there was however, no demonstrable agonism or antagonism in permeabilised hepatocytes for Ca<sup>2+</sup> release for racemic Ins(1,2,4,6)P<sub>4</sub> 3ab and in receptor binding it had an  $\mathrm{IC}_{50}$  value of 1.06  $\mu M$  in cerebellum {cf IC<sub>50</sub> circa 50 nM for [<sup>3</sup>H]Ins(1,4,5)P<sub>3</sub>}. Previously, racemic  $Ins(1,2,4,6)P_4$  **3ab** was synthesised by Chung and Chang<sup>28</sup> and was evaluated for Ca<sup>2+</sup> release in Chinese Hamster Ovary cells,<sup>29</sup> where it mobilised only 34.7% of the intracellular Ca<sup>2+</sup> stores at 100  $\mu$ M concentration. Its affinity for the Ins(1,4,5)P<sub>3</sub> receptor of bovine adrenal cortical membranes was some 653-fold lower than Ins(1,4,5)P<sub>3</sub>.<sup>29</sup> Fig. 6 shows the biologically active Ins(1,4,5)P<sub>3</sub> and docked into the Ins(1,4,5)P<sub>3</sub> binding site of the recently published crystal structure of type-I Ins(1,4,5)P<sub>3</sub> receptor.<sup>30</sup> Using such docking studies we can predict that a phosphate group cannot be accommodated comfortably in the axial direction at position-3 of Ins(1,4,5)P<sub>3</sub>, which corresponds to the 2-position of Ins(1,4,6)P<sub>3</sub> (Fig. 6). The resulting Ins(1,2,4,6)P<sub>4</sub> should therefore have low affinity for the Ins(1,4,5)P<sub>3</sub> receptor and be ineffective at Ca<sup>2+</sup> release, as demonstrated by our results above and those of others.

**Fig. 6** Three dimensional structure of the  $Ins(1,4,5)P_3$  binding site of the type 1 receptor based on the X-ray crystal structure of the mouse receptor core binding domain in complex with  $Ins(1,4,5)P_3$ .<sup>30</sup> Molecular docking experiments suggest that  $Ins(1,4,6)P_3$  (green) may be a relatively effective mimic of  $Ins(1,4,5)P_3$  at the type 1  $Ins(1,4,5)P_3$  binding site because it can bind in an orientation that allows its phosphate groups to mimic the three phosphate groups of  $Ins(1,4,5)P_3$  while its axial 2-hydroxyl group is accepted by an open region close to Gly-268. The region close to the 2-hydroxyl group of  $Ins(1,4,6)P_3$  is sterically constrained to addition of another phosphate group as in  $Ins(1,2,4,6)P_4$ . For clarity, all hydrogen atoms and the six crystallographic observed water molecules have been omitted.

Racemic  $Ins(1,2,4,6)P_4$  **3ab**, was tested for inhibition of 3kinase from rat brain.<sup>27</sup> In their study, Choi and co-workers<sup>27</sup> reported that racemic  $Ins(1,2,4,6)P_4$  showed greater inhibition of 3-kinase (IC<sub>50</sub> value of 42.1 µM) than  $Ins(1,3,4,5)P_4$  (IC<sub>50</sub> value of 220 µM). Our study is the first in which both enantiomers, D- and L-Ins(1,2,4,6)P<sub>4</sub> (**3a** and **3b**), have been evaluated against both 3-kinase and 5-phosphatase. D-Ins(1,2,4,6)P<sub>4</sub> (Table 1 and Fig. 5) was found to be a good inhibitor of 5-phosphatase with an IC<sub>50</sub> value of 3.8 µM [*cf* Ins(1,4,6)P<sub>3</sub> has a  $K_i$  value of 9.2µM from another study], although it was 20fold weaker than Ins(1,3,4,5)P<sub>4</sub> and not recognised by 3-kinase. L-Ins(1,2,4,6)P<sub>4</sub> (Table 1 and Fig. 5) was a reasonable inhibitor of 5-phosphatase with an IC<sub>50</sub> value of 14 µM and some 74-fold weaker than  $Ins(1,3,4,5)P_4$ , but not recognised by 3-kinase. To complete this study we also evaluated two other chiral tetrakisphosphates, namely, D-Ins(1,2,4,5)P<sub>4</sub> **5a** and L-Ins(1,2,4,5)P<sub>4</sub> **5b** (Table 1 and Fig. 5).<sup>10</sup> Previously, we<sup>31</sup> and others<sup>32</sup> have shown that racemic  $Ins(1,2,4,5)P_4$  is a full agonist at the  $Ins(1,4,5)P_3$  receptor and a potent 5-phosphatase inhibitor, but is not recognised by 3-kinase. The biological interaction of these enantiomers with 3-kinase and 5-phosphatase has, however, not been examined. We found that D-Ins(1,2,4,5)P<sub>4</sub> **5a** is a potent inhibitor of 5-phosphatase having an IC<sub>50</sub> value of 0.47  $\mu$ M but is not recognised by 3-kinase. L-Ins(1,2,4,5)P<sub>4</sub> is also a good inhibitor of 5-phosphatase, with an IC<sub>50</sub> value of 3  $\mu$ M and does not inhibit 3-kinase.

These results illustrate some recognition elements of 3-kinase. We have found that only  $Ins(1,3,4,5)P_4$  inhibits 3-kinase significantly, having an equatorial 3-phosphate and an axial 2-hydroxyl moiety and a 6-hydroxyl together with a D-1,4,5 arrangement of phosphates. Deviation from these requirements results in a dramatic loss of recognition by the 3-kinase, although inverting the stereochemistry at the 3-position of  $Ins(1,4,5)P_3$  **1a** to give L-chiro-Ins(2,3,5)P\_3 **26** delivers a potent 3-kinase inhibitor.

For 5-phosphatase inhibition, the D-series of inositol phosphates possessing a D-1,4,5-type of phosphate arrangement plus an extra phosphate at the 2- or 3-position is more potent than the L-series of inositol tetrakisphosphates. Similarly, phosphate substitution at position-2 of  $Ins(1,4,6)P_3$  to give  $Ins(1,2,4,6)P_4$ , delivers a more potent 5-phosphatase inhibitor than the 1,4,6-trisphosphate analogue. This corresponds with the general trend that tetrakisphosphates are more potent 5-phosphatase inhibitors than trisphosphate derivatives. However, trisphosphates having a D-1,4,5-configuration and a 6-hydroxyl [derived from L-*chiro*-Ins(2,3,5)P<sub>3</sub> and Ins(1,4,6)P<sub>3</sub>] are superior inhibitors of 3-kinase than most of the tetrakisphosphates.

We have synthesised D- and L-Ins $(1,2,4,6)P_4$  and evaluated these compounds against, 5-phosphatase and 3-kinase. Broadly, our results confirm early conclusions that 5-phosphatase has loose specificity of recognition, where that for 3-kinase is very stringent.<sup>5</sup> In agreement with the 5-phosphatase activity of other tetrakisphosphates, D-Ins $(1,2,4,6)P_4$  is more potent than the corresponding D-Ins $(1,4,6)P_3$  4a and the D-series of inositol trisphosphates derived from a 1,4,5-trisphosphate motif and an additional 6-hydroxyl group is more potent than the corresponding L-derivatives. Substitution of a phosphate group at position-2 of Ins $(1,4,6)P_3$  to give Ins $(1,2,4,6)P_4$  3a, removes any interaction of this compound with 3-kinase.

Thus, we have synthesised the enantiomers of  $Ins(1,2,4,6)P_4$ and provide the first evaluation of the activity against  $Ins(1,4,5)P_3$  5-phosphatase and 3-kinase. We have also rationalised why D-Ins(1,2,4,6)P\_4 is apparently inactive in Ca<sup>2+</sup> mobilisation at the ins(1,4,5)P\_3 receptor, relative to the active trisphosphate  $Ins(1,4,6)P_3$ . These results contribute to the developing structure–activity relationship amongst the soluble inositol polyphosphates.

# Experimental

#### Materials and methods

Chemicals were purchased from Aldrich, Fluka and Lancaster. Sodium hydride was 60% pure in a dispersion mineral oil. Thinlayer chromatography (TLC) was performed on precoated plates (Merck TLC aluminium sheets silica 60  $F_{254}$ ): products were visualised by spraying with phosphomolybdic acid in methanol, and heated at high temperature. Flash chromatography refers to the procedure developed by Still *et al.*<sup>33</sup> and was carried out on Sorbsil C60 silica gel. D-Ins(1,3,4,5)P<sub>4</sub> was purchased from Eurobiochem (Belgium) and D- and L-Ins(1,2,4,5)P<sub>4</sub> were synthesised according to the published procedure.<sup>10</sup> All final compounds were homogeneous as judged by standard spectroscopic methods and purified by ion exchange chromatography and used as their triethylammonium salts. Ion exchange chromatography was performed on an LKB-Pharmacia Medium Pressure Ion Exchange Chromatograph using Q-Sepharose Fast Flow with gradients of triethylammonium hydrogen carbonate (TEAB) as eluent. Column fractions containing inositol polyphosphates and phosphorothioates were assayed for total phosphate and phosphorothioate by a modification of the Briggs test.<sup>11</sup> (Diisopropylamino)dichlorophosphine was prepared by the method of Tanaka et al.<sup>34</sup> by adding two mole equivalents of diisopropylamine to a solution of phosphorus trichloride in dry diethyl ether at -78 °C. The crude product was purified by distillation under reduced pressure ( $\delta_{\mathbf{P}} = +169.4$  ppm) and could be stored as a crystalline solid at -20 °C. Two equivalents of benzyl alcohol in the presence of triethylamine were then reacted with the purified product in methylene dichloride, to afford bis(benzyloxy)(diisopropylamino)phosphine<sup>9</sup> ( $\delta_{\rm P}$  = +147.9 ppm) which was pure by <sup>31</sup>P NMR, ( $R_f = 0.78$ , hexanetriethylamine 10:1). NMR spectra (proton frequency 270, or 400 MHz) were referenced to SiMe<sub>4</sub>, (HDO) or  $[^{2}H_{6}]$ -dimethyl sulfoxide ([<sup>2</sup>H<sub>6</sub>]DMSO). The <sup>31</sup>P NMR shifts were measured in ppm relative to external 85% phosphoric acid. Melting points (uncorrected) were determined using a Reichert-Jung Thermo Galen Kofler block. Microanalysis was carried out by the Microanalysis Service, at the University of Bath. Mass spectra were recorded by the University of Bath Mass Spectrometry Service using positive and negative Fast Atom Bombardment (FAB) with 3-nitrobenzyl alcohol (NBA) as the matrix. Optical rotations were measured using an Optical Activity Ltd. AA-10 polarimeter, and  $[a]_{D}$ -values are given in 10<sup>-1</sup> deg cm<sup>2</sup> g<sup>-1</sup> and were measured at ambient temperature.

#### Ins(1,4,5)P<sub>3</sub> 5-phosphatase and 3-kinase activities

The activities of  $Ins(1,4,5)P_3$  5-phosphatase and 3-kinase were determined at 1  $\mu$ M of  $Ins(1,4,5)P_3$  substrate concentration using published procedures.<sup>35,36</sup> We used purified recombinant enzymes from rat brain for the  $Ins(1,4,5)P_3$  3-kinase (clone C5). Cloning and expression was carried out in *Escherichia coli* of the rat brain cDNA encoding a Ca<sup>2+</sup>/calmodulin-sensitive *myo*-inositol 1,4,5-trisphosphate 3-kinase,<sup>37</sup> and the source of  $Ins(1,4,5)P_3$  5-phosphatase was derived from human brain (clone ECH11).<sup>38</sup> The  $Ins(1,4,5)P_3$  3-kinase activity was determined in the presence of 0.9 mM EGTA. The incubation period was 10 min in the presence of [<sup>3</sup>H]Ins(1,4,5)P<sub>3</sub> was sourced from EuroBiochem.

#### Molecular modelling

Molecular docking of  $Ins(1,4,6)P_3$  and  $Ins(1,4,5)P_3$  to the ligand binding domain of the  $Ins(1,4,5)P_3$  receptor was carried out similarly to that described by Rosenberg *et al.*<sup>39</sup>

#### 2,4,6-Tri-O-allyl-myo-inositol orthoformate 7

A mixture of *myo*-inositol orthoformate<sup>7</sup> **6** (3.83 g, 20 mmol) and 60% sodium hydride (4.0 g, 100 mmol) was stirred in DMF (50 cm<sup>3</sup>) at 0 °C. Allyl bromide (6.05 cm<sup>3</sup>, 70 mmol) was added dropwise over 10 min, and the reaction mixture was stirred at room temperature for 3 h. TLC (Et<sub>2</sub>O–hexane 1 : 1), showed a single product ( $R_f$  0.44). The reaction was cooled with ice–water and the excess sodium hydride was destroyed with methanol (10 cm<sup>3</sup>). The solvents were evaporated *in vacuo* and the residue was partitioned between ether (200 cm<sup>3</sup>) and water (200 cm<sup>3</sup>). The organic layer was separated and dried (MgSO<sub>4</sub>), then evaporated to give an oil, which was purified by flash chromatography (Et<sub>2</sub>O–pentane 1 : 1) to give the title compound 7 as a syrup. Yield (5.54 g, 89%); (Found: C, 61.7; H, 7.23. C<sub>16</sub>H<sub>22</sub>O<sub>6</sub> requires C, 61.92; H, 7.15%);  $\delta_{\rm H}$  (270 MHz; CDCl<sub>3</sub>) 3.91 (1 H, d, J 1.65, CH), 4.01–4.33 (10 H, m, 3 × OCH<sub>2</sub>CHCH<sub>2</sub> and 4 inositol ring protons), 4.41 (1 H, m, CH), 5.18–5.37 (6 H, m, 3 × OCH<sub>2</sub>CHCH<sub>2</sub>), 5.53 (1 H, d, J 1.3, CH), 5.81–6.07 (3 H, m, 3 × OCH<sub>2</sub>CHCH<sub>2</sub>);  $\delta_{\rm C}$  (68 MHz; CDCl<sub>3</sub>) 67.48, 67.58, 68.05, 73.76 (*myo*-inositol ring carbons), 70.59 (OCH<sub>2</sub>CHCH<sub>2</sub>), 103.11 (CH, orthoformate), 117.42, 117.67 (OCH<sub>2</sub>CHCH<sub>2</sub>), 134.12, 134.57 (OCH<sub>2</sub>CHCH<sub>2</sub>); *m/z* (FAB<sup>+</sup>) 621.3 (46), 446.1 (39), 311.1 (100), 253.1 (20), 153.1 (32), 81.0 (34).

#### 2,4,6-Tri-O-allyl-myo-inositol 8

2,4,6-Tri-O-allyl-myo-inositol orthoformate 7 (5.0 g, 16.1 mmol) was heated at reflux temperature in a mixture of ethanol and  $1.0 \text{ mol } dm^{-3}$  aq. HCl ( $60 \text{ cm}^3 2: 1$ ) for 3 h, after which TLC (CH<sub>2</sub>Cl<sub>2</sub>-EtOAc 1 : 1) showed a single product ( $R_f$  0.30). The solvents were evaporated in vacuo to give a syrup, then co-evaporated with water (2  $\times$  50 cm<sup>3</sup>) to give the title compound 8 (4.5 g, 93%) as a solid; mp 77-78 °C (from EtOAchexane); (Found: C, 60.0; H, 8.15. C<sub>15</sub>H<sub>24</sub>O<sub>6</sub> requires C, 59.98; H, 8.05%);  $\delta_{\rm H}$  (400 MHz; CDCl<sub>3</sub>) 2.55 (2 H, d, J 5.5, D<sub>2</sub>O ex, OH), 2.74 (1 H, d, J 2.1, D<sub>2</sub>O ex, OH), 3.41-3.50 (5 H, m, 1-H, 3-H, 4-H, 5-H and 6-H), 3.90 (1 H, s, 2-H), 4.31-4.40 (6 H, m, 3 × OCH<sub>2</sub>CHCH<sub>2</sub>), 5.18–5.33 (6 H, m, 3 × OCH<sub>2</sub>CHCH<sub>2</sub>), 5.90–6.02 (3 H, m,  $3 \times \text{OCH}_2\text{CHCH}_2$ );  $\delta_c$  (100 MHz; CDCl<sub>3</sub>) 73.94, 74.28 (OCH<sub>2</sub>CHCH<sub>2</sub>), 72.37, 74.76, 79.17, 81.69 (myoinositol ring carbons), 116.93, 117.24 (OCH<sub>2</sub>CHCH<sub>2</sub>), 134.96, 135.07 (OCH<sub>2</sub>CHCH<sub>2</sub>); m/z (FAB<sup>+</sup>) 601.2 (10), 301.1 (88), 243.1 (100), 153.1 (44), 109.0 (88), 81.0 (70).

#### DL-1,2,4,6-Tetra-O-allyl-myo-inositol 9ab

A mixture of 2,4,6-tri-O-allyl-myo-inositol 8 (4.3 g, 14.3 mmol), allyl bromide (1.47 cm<sup>3</sup> 17 mmol), tetrabutylammonium sulfate<sup>8</sup> (5.08 g, 15 mmol) in methylene dichloride (150 cm<sup>3</sup>) and 5% aq. sodium hydroxide (150 cm3), was heated at reflux temperature for 24 h. The organic layer was separated and washed with water  $(2 \times 100 \text{ cm}^3)$  then dried (MgSO<sub>4</sub>) and evaporated to give a syrup. Flash chromatography (CH<sub>2</sub>Cl<sub>2</sub>-EtOAc 3 : 1) gave the title compound **9ab** as a syrup (3.6 g, 74%,  $R_{\rm f}$ 0.62, CH<sub>2</sub>Cl<sub>2</sub>-EtOAc 1 : 1), together with other minor products  $R_{\rm f}$  0.88,  $R_{\rm f}$  0.44 and a tiny quantity of starting material  $R_{\rm f}$  0.24, which were not isolated; (Found: C, 63.4; H, 8.36. C<sub>18</sub>H<sub>28</sub>O<sub>6</sub> requires C, 63.49; H, 8.30%);  $\delta_{\rm H}$  (400 MHz; CDCl<sub>3</sub>) 2.45 (2 H, br m, D<sub>2</sub>O ex, OH), 3.23 (1 H, dd, J 2.45, 9.8, 1-H), 3.39 (1 H, t, J 8.8, 5-H), 3.42 (1 H, dd, J 2.9, 10.7, 3-H), 3.51 (1 H, t, J 9.3, 4-H), 3.64 (1 H, t, J 9.8, 6-H), 3.93 (1 H, t, J 2.9, 2-H), 4.07-4.45 (8 H, m, 4 × OCH<sub>2</sub>CHCH<sub>2</sub>), 5.18–5.33 (8 H, m, 4 × OCH<sub>2</sub>-CHCH<sub>2</sub>), 5.90–6.02 (4 H, m, 4 × OCH<sub>2</sub>CHCH<sub>2</sub>);  $\delta_{\rm C}$  (100 MHz; CDCl<sub>3</sub>) 71.52, 71.94, 73.86, 74.23 (OCH<sub>2</sub>CHCH<sub>2</sub>), 71.94, 74.65, 76.72, 80.56, 80.76 (myo-inositol ring carbons), 116.80, 116.90, 117.11 (OCH<sub>2</sub>CHCH<sub>2</sub>), 135.20, 135.26 (OCH<sub>2</sub>-CHCH<sub>2</sub>); m/z (FAB<sup>+</sup>) 681.9 (68), 341.2 (100), 283.2 (62), 225.2 (6), 111.0 (16), 97 (36).

#### DL-1,2,4,6-Tetra-O-allyl-3,5-di-O-benzyl-myo-inositol 10ab

A mixture of DL-1,2,4,6-tetra-*O*-allyl-*myo*-inositol **9ab** (1.60 g, 4.70 mmol) and sodium hydride (1.25 g, 31.25 mmol) was stirred in dry DMF (40 cm<sup>3</sup>). Benzyl bromide (1.68 cm<sup>3</sup>, 14.1 mmol) was added dropwise and the solution was stirred for 2 h at room temperature. TLC (Et<sub>2</sub>O–pentane 1 : 3) showed a new product  $R_f$  0.50. The excess sodium hydride was destroyed with methanol (10 cm<sup>3</sup>) and the solvents were evaporated *in vacuo* to give an oil. The crude product was partitioned between water and ether (50 cm<sup>3</sup> of each) and washed with 0.10 mol dm<sup>-3</sup> aq. hydrochloric acid, then water again (50 cm<sup>3</sup> of each). The organic layer was dried (MgSO<sub>4</sub>) and the solvent was purified by flash chromatography (pentane–Et<sub>2</sub>O 3 : 1) to give the title com-

pound **10ab** (2.15 g, 88%) as an oil which solidified, but could not be crystallised; (Found: C, 73.5; H, 7.68.  $C_{32}H_{40}O_6$  requires C, 73.81; H, 7.75%);  $\delta_{\rm H}$  (400 MHz; CDCl<sub>3</sub>) 3.14 (1 H, dd, *J* 2.4, 9.8, 1-H or 3-H), 3.25 (1 H, t, *J* 2.1, 9.8, 1-H or 3-H), 3.32 (1 H, t, *J* 9.2, 5-H), 3.77 (1 H, t, *J* 9.5, 4-H or 6-H), 3.80 (1 H, t, *J* 9.8, 4-H or 6-H), 3.90 (1 H, t, *J* 2.1, 2-H), 4.10–4.40 (8 H, m, 4 × OCH<sub>2</sub>CHCH<sub>2</sub>), 4.66, 4.70 (2 H, AB, *J* 11.9, OCH<sub>2</sub>Ph), 4.82 (2 H, s, OCH<sub>2</sub>Ph), 5.12–5.31 (8 H, m, 4 × OCH<sub>2</sub>CHCH<sub>2</sub>), 5.85– 6.03 (4 H, m, 4 × OCH<sub>2</sub>CHCH<sub>2</sub>), 7.22–7.38 (10 H, m, 2 × OCH<sub>2</sub>Ph);  $\delta_{\rm C}$  (100 MHz; CDCl<sub>3</sub>) 71.65, 72.82, 73.24, 74.54, 75.99 (*C*H<sub>2</sub>Ph and OCH<sub>2</sub>CHCH<sub>2</sub>), 74.12, 80.32, 80.58, 81.33, 83.61 (*myo*-inositol ring carbons), 116.44, 116.48, 116.55, 116.64 (OCH<sub>2</sub>CHCH<sub>2</sub>), 127.54, 128.09, 128.31, 128.34 (CH<sub>2</sub>Ph), 134.96, 135.50, 135.64, 135.77 (OCH<sub>2</sub>CHCH<sub>2</sub>), 138.49, 138.88 (C<sub>q</sub>, CH<sub>2</sub>Ph); *m*/z (FAB<sup>+</sup>) 521.1 (88), 249.0 (12), 181.0 (50), 91.0 (100).

### DL-1,5-Di-O-benzyl-myo-inositol 11ab

A mixture of DL-1,2,4,6-tetra-O-allyl-3,5-di-O-benzyl-myoinositol 10ab (1.20 g, 2.50 mmol), palladium on activated charcoal (10% Fluka, 1.0 g) and toluene p-sulfonic acid was dissolved in methanol-water ( $120 \text{ cm}^3, 5:1$ ) then heated under reflux for 1.5 h, after which TLC (EtOAc) showed a new product  $R_{\rm f}$  0.20. The solution was filtered through Celite and evaporated to give a solid. The crude product was purified by flash chromatography (CHCl<sub>3</sub>-MeOH 10 : 1) to give the title compound 11ab, (441 mg, 49%) as a solid; mp 139-141 °C (from ethanol); (Found: C, 66.4; H, 6.72. C<sub>20</sub>H<sub>24</sub>O<sub>6</sub> requires C, 66.64; H, 6.72%); δ<sub>H</sub> (270 MHz; [<sup>2</sup>H<sub>6</sub>]DMSO) 3.04 (1 H, t, J 9.0, 5-H), 3.14 (2 H, d, J 9.3, 1-H and 3-H, D<sub>2</sub>O ex, 2 dd, overlapping), 3.58 (1 H, dt, J 9.3, 5.0, 4-H or 6-H), 3.77 (1 H, dt, J 9.3, 5.5, 4-H or 6-H), 3.98 (1 H, s, 2-H), 4.56 (1 H, d, J 5.5, D<sub>2</sub>O ex, OH), 4.58 (1 H, d, J 7.0, D<sub>2</sub>O ex, OH), 4.64 (2 H, m, OCH<sub>2</sub>Ph), 4.73 (1 H, d, J 4.9, D<sub>2</sub>O ex, OH), 4.79 (2 H, app s, OCH<sub>2</sub>Ph), 4.92 (1 H, d, J 5.3, D<sub>2</sub>O ex, OH), 7.21–7.45 (10 H, m,  $2 \times OCH_2Ph$ ;  $\delta_C$  (68 MHz; [<sup>2</sup>H<sub>6</sub>]DMSO) 69.12, 71.86, 71.92, 72.42, 80.16, 84.33 (myo-inositol ring carbons), 70.79, 73.80 (CH<sub>2</sub>Ph), 127.01, 127.19, 127.60, 127.94, 128.08 (CH<sub>2</sub>Ph), 139.34, 139.95 (C<sub>a</sub>, CH<sub>2</sub>Ph); m/z (FAB<sup>+</sup>) 513.1 (76), 359.1 (36), 308.0 (26), 91.0 (100).

# DL-3,5-Di-O-benzyl-1,2,4,6-tetrakis-O-[di(benzyloxy)-phosphoryl)]-myo-inositol 13ab

A mixture of bis(benzyloxy)diisopropylaminophosphine (0.69 g, 2 mmol) and 1H-tetrazole (0.28 g, 4 mmol) in dry methylene dichloride (5 cm<sup>3</sup>) was stirred at room temperature for 15 min. DL-1,5-Di-O-benzyl-myo-inositol 11ab (0.108 g, 0.30 mmol) was added to the solution which was stirred for a further 10 min. The reaction mixture was cooled with ice-water and (50-60%) MCPBA (0.80 g, 2.30 mmol) was added slowly and the mixture was stirred for a further 30 min. The solution was diluted with ethyl acetate (50 cm<sup>3</sup>) and washed with 10% aq. sodium metabisulfite (50 cm<sup>3</sup>), saturated aq. sodium hydrogen carbonate, brine and water (50 cm<sup>3</sup> of each). The organic layer was isolated then dried (MgSO<sub>4</sub>) and evaporated to give an oil. The crude product was purified by flash chromatography,  $(R_{\rm f}$ 0.20, CHCl<sub>3</sub>-acetone 5 : 1) then EtOAc-pentane 2 : 1, to give the title compound 13ab (0.382 g, 91%) as a solid; mp 76-77 °C (from EtOAc-pentane);  $\delta_{\rm H}$  (400 MHz; CDCl<sub>3</sub>) 3.63 (1 H, d, J 10.3, 3-H), 3.63 (1 H, t, J 9.8, 5-H), 4.47-5.20 (23 H, m, 1-H, 4-H, 6-H and 10 × OCH<sub>2</sub>Ph), 5.58 (1 H, d, J 8.85, 2-H), 6.92-7.46 (50 H, m, 8 × O(O)POCH<sub>2</sub>Ph, 2 × OCH<sub>2</sub>Ph);  $\delta_{\rm C}$  (100 MHz; CDCl<sub>3</sub>) 69.24, 69.29, 69.37, 69.40, 69.55, 69.60, 69.68, 70.00, 70.15, 72.16, 74.56 (CH<sub>2</sub>Ph), 73.95, 74.40, 75.88, 76.97, 78.50, 79.30 (myo-inositol ring carbons), 127.16, 127.65, 127.80, 127.85, 127.94, 128.05, 128.11, 128.16, 128.27, 128.40, 128.53, 128.64, 129.48, 129.90 (CH<sub>2</sub>Ph), 133.37, 134.22, 135.39, 135.53, 135.62, 136.56, 137.87 (C<sub>q</sub>, CH<sub>2</sub>*Ph*); δ<sub>P</sub> (162 MHz; D<sub>2</sub>O) -1.04, -1.26, -1.43, -2.75; m/z (FAB<sup>+</sup>) 1401.0 (64), 1311.0 (15), 1033.0 (10), 459 (16), 361 (40), 301 (10), 181.1 (22), 91 (100); [Found: m/z, 1401.4066 (M + H)<sup>+</sup> requires m/z 1401.4060].

#### DL-myo-Inositol 1,2,4,6-tetrakisphosphate 3ab

DL-3,5-Di-O-benzyl-1,2,4,6-tetrakis-O-[di(benzyloxyphosphoryl)]-myo-inositol 13ab (0.165 g, 0.118 mmol) was hydrogenolysed in a mixture of methanol (40 cm<sup>3</sup>) and water  $(10 \text{ cm}^3)$ , in the presence of palladium on carbon (10%, 0.20 g)for 20 h. The reaction mixture was filtered over a bed of Celite to remove the insoluble components, and washed with water and methanol, then evaporated in vacuo to give a syrup. The residue was then dissolved in MilliQ water (150 cm<sup>3</sup>) and purified by ion exchange chromatography on Q-Sepharose Fast Flow with a gradient of TEAB buffer (0–1000 mmol  $dm^{-3}$ ) at pH 8.6. The triethylammonium salt of 3ab eluted at ca. 800 mmol dm<sup>-3</sup>. Yield (39  $\mu$ mol, 33%);  $\delta_{\rm H}$  (400 MHz; D<sub>2</sub>O) 3.60 (1 H, t, J 9.2, 5-H), 3.69 (1 H, d, J 9.3, 3-H), 4.10 (1 H, J 9.3, 1-H), 4.23 (1 H, q, J 9.2, 4-H or 6-H), 4.32 (1 H, q, J 9.2, 4-H or 6-H), 4.69 (1 H, d, J 9.2, 2-H); δ<sub>P</sub> (162 MHz; D<sub>2</sub>O) 2.12 (1 P, d, J 10.1), 1.75 (1 P, br d, J 13.5), 1.62 (1 P, d, J 10.0), 1.32 (1 P, d, J 10.0); m/z (FAB<sup>-</sup>) 999.1 (5), 499.0 (100), 291.2 (5); [Found: m/z, 498.9193 (M-H)<sup>-</sup> requires m/z 498.9208].

## DL-2,3-O-Isopropylidene-1,4,6-tris-O-p-methoxybenzyl-myoinositol 16ab, DL-2,3-O-isopropylidene-1,4,5-tris-O-p-methoxybenzyl-myo-inositol 15ab and DL-2,3-O-isopropylidene-1,4,5,6tetrakis-O-p-methoxybenzyl-myo-inositol 17ab

A mixture of DL-2,3-O-isopropylidene-1,4-di-O-p-methoxybenzyl-myo-inositol<sup>12</sup> 14ab (9.21 g, 20 mmol), acetonitrile (400 cm<sup>3</sup>), dibutyltin oxide (5.48 g, 22 mmol), tetrabutylammonium bromide (6.45 g, 20 mmol) and p-methoxybenzyl chloride (4.35 cm<sup>3</sup>, 30 mmol) was heated under reflux in a Soxhlet apparatus containing 4 Å molecular sieves for 16 h. After this time a further quantity of p-methoxybenzyl chloride (4.35 cm<sup>3</sup>, 30 mmol) was added, together with some tetrabutylammonium iodide (7.38 g, 20 mmol) and heated under reflux for a further 24 h, after which the reaction was complete according to TLC. The reaction mixture was cooled, the solvent was evaporated and the orange residue was partitioned between water and ether (250 cm<sup>3</sup> of each). The organic layer was separated and stirred with a saturated aqueous solution of sodium hydrogen carbonate (250 cm<sup>3</sup>) for 1 h. The solid components were removed by filtering the solution over Celite then washed with ether and the organic layer was dried over magnesium sulfate. TLC (CH<sub>2</sub>Cl<sub>2</sub>-EtOAc 1 : 1) showed four products, p-methoxybenzyl halide, Rf 0.78; DL-2,3-O-isopropylidene-1,4,5,6-tetrakis-O-p-methoxybenzyl-myo-inositol 17ab, Rf 0.44; DL-2,3-O-isopropylidene-1,4,6-tris-O-p-methoxybenzyl-myo-inositol 16ab, R<sub>f</sub> 0.34 and DL-2,3-O-isopropylidene-1,4,5-tris-O-p-methoxybenzyl-myo-

inositol **15ab**,  $R_f$  0.22, which were separated by flash chromatography to give the products as syrups. DL-2,3-*O*-Isopropylidene-1,4,5-tris-*O*-*p*-methoxybenzyl-*myo*-inositol **15ab** was recrystallised from Et<sub>2</sub>O-pentane. **16ab** (5.34 g, 46%), **15ab** (3.01 g, 26%), **17ab** (0.87 g, 6%).

**16ab** (Found: C, 68.1; H, 6.99.  $C_{33}H_{40}O_9$  requires C, 68.26; H, 6.94%);  $\delta_H$  (400 MHz; [<sup>2</sup>H<sub>6</sub>]DMSO) 1.28, 1.38 (6 H, 2 s, CMe<sub>2</sub>), 3.32 (1 H, br t, D<sub>2</sub>O ex, t, J 9.2, 5-H), 3.50 (2 H, m, 1-H or 3-H and 6-H), 3.66 (1 H, dd, J 3.7, 7.6, 4-H), 3.74 (9 H, s, OMe), 4.05 (1 H, t, J 6.7, 1-H or 3-H), 4.36 (1 H, t, J 4.0, 2-H), 4.52–4.69 (6 H, m, 3 × OCH<sub>2</sub>C<sub>6</sub>H<sub>4</sub>OMe), 5.15 (1 H, br s, D<sub>2</sub>O ex, OH), 6.86–6.89 (6 H, m, OCH<sub>2</sub>C<sub>6</sub>H<sub>4</sub>OMe), 7.23–7.32 (6 H, m, OCH<sub>2</sub>C<sub>6</sub>H<sub>4</sub>OMe);  $\delta_C$  (100 MHz; [<sup>2</sup>H<sub>6</sub>]DMSO) 25.67, 27.56 (CMe<sub>2</sub>), 55.03 (CH<sub>2</sub>PhOMe), 72.20, 73.06, 73.20 (CH<sub>2</sub>PhOMe), 71.16, 73.66, 76.46, 78.23, 80.79, 81.84 (*myo*-inositol ring carbons), 108.50 (C<sub>q</sub>, CMe<sub>2</sub>), 113.38, 113.51, 127.90, 129.04, 129.20 (CH<sub>2</sub>PhOMe), 130.57, 130.99, 131.09 (C<sub>q</sub>, CH<sub>2</sub>PhOMe), 158.55, 158.63 (C<sub>q</sub>, CH<sub>2</sub>PhOMe); *m*/*z* (FAB<sup>-</sup>) 733.3 (100), 579.2 (60), 467.1 (50), 258.1 (44), 92 (30).

**15ab** (Found: C, 68.0; H, 6.90. #### DL-5-O-Benzyl-2,3-O-isopropylidene-1,4,6-tris-O-p-methoxybenzyl-myo-inositol 18ab

A mixture of DL-2,3-O-isopropylidene-1,4,6-tris-O-p-methoxybenzyl-myo-inositol 16ab (5.34 g, 9.18 mmol) and sodium hydride (0.96 g, 24 mmol) in dry DMF (60 cm<sup>3</sup>) was stirred at room temperature. Benzyl bromide (2.38 cm<sup>3</sup>, 20 mmol) was added to the solution, which was then stirred for a further 2 h. The excess sodium hydride was destroyed with methanol (10 cm<sup>3</sup>) and the solvents were evaporated in vacuo. The crude product was partitioned between ether and water (100 cm<sup>3</sup> of each) and the organic layer was separated and dried (MgSO<sub>4</sub>). The fully protected product 18ab was purified by flash chromatography (R<sub>f</sub> 0.22, Et<sub>2</sub>O-pentane 1 : 1). Yield (5.29 g, 86%); (Found: C, 71.7; H, 7.03. C40H46O9 requires C, 71.62; H, 6.91%); δ<sub>H</sub> (270 MHz; CDCl<sub>3</sub>) 1.35, 1.52 (6 H, 2 s, CMe<sub>2</sub>), 3.37 (1 H, t, J 9.2, 5-H), 3.64 (1 H, dd, J 3.7, 9.0, 1-H or 3-H), 3.75-3.79 (1 H, obscured, 1-H or 3-H), 3.77 (3 H, s, OMe), 3.78 (3 H, s, OMe), 3.79 (3 H, s, OMe), 3.90 (1 H, t, J 8.8, H-4 or H-6), 4.06 (1 H, t, J 6.6, H-4 or H-6), 4.21 (1 H, dd, J 4.0, 5.3, H-2), 4.63–4.80 (8 H, m, OCH<sub>2</sub>Ph and  $3 \times OCH_2C_6H_4OMe$ ), 6.83– 7.34 (17 H, m, CH<sub>2</sub>Ph and 3 × OCH<sub>2</sub>C<sub>6</sub>H<sub>4</sub>OMe);  $\delta_{\rm C}$  (68 MHz; CDCl<sub>3</sub>) 25.70, 27.67 (CMe<sub>2</sub>), 55.09, 55.19 (CH<sub>2</sub>PhOMe), 72.80, 73.46, 74.87, 75.13 (CH<sub>2</sub>Ph and CH<sub>2</sub>PhOMe), 74.53, 76.66, 79.09, 80.50, 82.11 (myo-inositol ring carbons), 109.63 (CMe<sub>2</sub>), 113.67, 126.82, 127.44, 127.83, 128.20 (CH<sub>2</sub>Ph and CH<sub>2</sub>-*Ph*OMe), 130.23, 130.63, 130.74 (C<sub>q</sub>, CH<sub>2</sub>*Ph*OMe), 138.63 (C<sub>q</sub>, CH<sub>2</sub>*Ph*), 159.04, 159.11, 159.24 (C<sub>q</sub>, CH<sub>2</sub>*Ph*OMe); *m*/*z* (FAB<sup>+</sup>) 639.3 (20), 669.3 (22), 549.2 (76), 241.1 (22), 211.1 (52), 121.0 (100).

#### DL-5-O-Benzyl-1,4,6-tris-O-p-methoxybenzyl-myo-inositol 19ab

DL-5-*O*-Benzyl-2,3-*O*-isopropylidene-1,4,6-tris-*O*-*p*-methoxybenzyl-*myo*-inositol **18ab** (9.46 g, 14.08 mmol) was dissolved in methanol–1.0 mol dm<sup>-3</sup> aq. HCl (100 cm<sup>3</sup>, 9 : 1) and kept at 50 °C for 30 min. TLC (CH<sub>2</sub>Cl<sub>2</sub>–EtOAc 2 : 1) showed a new product  $R_f$  0.40, which precipitated from the reaction mixture as a white solid. The methanolic solution was cooled and the solid was filtered off. The remaining solution was kept at 50 °C

for a further 30 min, after which, most of the starting material had disappeared. The reaction mixture was cooled and the insoluble solid was filtered off. The acidic solution was neutralised with triethylamine (10 cm<sup>3</sup>) and the solvents were evaporated. The remaining solid was partitioned between methylene dichloride and water (50 cm<sup>3</sup> of each) and the organic layer was dried (MgSO<sub>4</sub>) and evaporated. The crude product was purified by flash chromatography ( $CH_2Cl_2$ -EtOAc 2 : 1) to give the pure title compound 19ab (7.0 g, 79%); mp 148-150 °C (from EtOAc-hexane); (Found: C, 70.2; H, 6.77. C<sub>37</sub>H<sub>42</sub>O<sub>9</sub> requires C, 70.46; H, 6.71%);  $\delta_{\rm H}$  (400 MHz; [<sup>2</sup>H<sub>6</sub>]DMSO) 3.32 (1 H, t, J 9.5, 5-H), 3.36–3.59 (2 H, br, D<sub>2</sub>O ex, OH), 3.37 (2 H, app dt, J 3.35, 9.5, D<sub>2</sub>O ex, 2 dd, J 2.45, 9.8, 1-H, J 2.75, 9.8, 3-H), 3.59 (1 H, t, J 9.5, 4-H or 6-H), 3.66 (3 H, s, OMe), 3.67 (3 H, s, OMe), 3.69 (3 H, OMe), 3.67-3.71 (1 H, obscured, 4-H or 6-H), 3.99 (1 H, t, J 2.4, 2-H), 4.44–4.78 (8 H, m, OCH<sub>2</sub>Ph and  $3 \times OCH_2$ - $C_6H_4OMe$ ), 6.79–7.50 (17 H, m,  $CH_2Ph$  and 3 ×  $OCH_2$ - $C_6H_4OMe$ );  $\delta_C$  (100 MHz; [<sup>2</sup>H<sub>6</sub>]DMSO) 55.27 (CH<sub>2</sub>PhOMe), 72.40, 75.25, 75.62 (CH<sub>2</sub>PhOMe and CH<sub>2</sub>Ph), 69.05, 71.58, 79.74, 80.94, 81.49, 83.92 (myo-inositol ring carbons), 113.77, 113.92, 113.99, 127.59, 127.70, 128.42, 129.53, 129.64, 129.94 (CH<sub>2</sub>Ph and CH<sub>2</sub>PhOMe), 130.65, 130.85 (C<sub>q</sub>, CH<sub>2</sub>PhOMe), 138.66 (C<sub>a</sub>, CH<sub>2</sub>Ph), 159.18, 159.34, 159.40 (C<sub>a</sub>, CH<sub>2</sub>PhOMe); m/z (FAB<sup>+</sup>) 653.3 (54), 629.3 (14), 509.2 (88), 419.3 (44), 329.1 (68), 242.2 (64), 167.1 (56), 121.0 (100).

# L-(21) and D-1-O-[*R*-(-)-O-Acetylmandelyl]-5-O-benzyl-3,4,6-tris-O-*p*-methoxybenzyl-*myo*-inositol 22

A mixture of DL-5-O-benzyl-1,4,6-tris-O-p-methoxybenzylmyo-inositol 19ab (6.60 g, 10.45 mmol), (R)-(-)-O-acetylmandelic acid 20 (2.06 g, 10.6 mmol) and 4-(dimethylamino)pyridine (0.03 g, 0.25 mmol) was stirred in methylene dichloride (100 cm<sup>3</sup>) at -20 °C. A solution of dicyclohexylcarbodiimide (DCCI) (2.15 g, 10.6 mmol) in methylene dichloride (20 cm<sup>3</sup>) was added dropwise over a period of 2 h with stirring, then stirred overnight at room temperature. TLC (CHCl<sub>3</sub>-acetone 15 : 1) showed two main products,  $R_f 0.34$  and 0.24, together with minor products at  $R_f$  0.44 and 0.14. The minor products were not investigated further. The solution was filtered over a bed of Celite and washed with methylene dichloride  $(2 \times 100 \text{ cm}^3)$ . The solvent was evaporated off to give a solid and the individual diastereoisomers were isolated by flash chromatography (CHCl<sub>3</sub>-acetone 15 : 1) to give 21  $R_f$  0.34 (2.74 g, 32%); mp 105–107 °C (from EtOAc–hexane);  $[a]_D$  –15 (c 1 in CHCl<sub>3</sub>) and 22 R<sub>f</sub> 0.24 (2.19 g, 26%); mp 127-129 °C from EtOAc-hexane;  $[a]_{D} - 37$  (c 1 in CHCl<sub>3</sub>).

21 (Found: C, 69.5; H, 6.18. C47H50O12 requires C, 69.96; H,  $(6.25\%); \delta_{\rm H}$  (400 MHz; CDCl<sub>3</sub>) 2.13 (1 H, s, D<sub>2</sub>O ex, OH), 2.22 [3 H, s, O<sub>2</sub>CCH(OAc)Ph], 3.41 (1 H, dd, J 2.4, 9.8, 3-H), 3.45 (1 H, t, J 9.5, 5-H), 3.77 (3 H, s, OMe), 3.78 (3 H, s, OMe), 3.79 (3 H, s, OMe), 3.88 (1 H, t, J 9.5, 4-H), 4.04 (1 H, t, J 9.5, 6-H), 4.11 (1 H, t, J 2.4, 2-H), 4.54-4.86 (9 H, m, 1-H, OCH<sub>2</sub>Ph and 3 × OCH<sub>2</sub>C<sub>6</sub>H<sub>4</sub>OMe), 5.97 [1 H, s, O<sub>2</sub>CCH(OAc)Ph], 6.76–7.47 (22 H, m, CH<sub>2</sub>*Ph*,  $3 \times \text{OCH}_2\text{C}_6H_4\text{OMe}$  and  $\text{O}_2\text{CCH}(\text{OAc})Ph$ );  $\delta_{\rm C}$  (100 MHz; CDCl<sub>3</sub>) 20.72 [OC(O)Me], 55.23 (CH<sub>2</sub>PhOMe), 74.72, 75.33, 75.57, 75.78 (CH<sub>2</sub>PhOMe, CH<sub>2</sub>Ph), 67.34, 72.51, 75.20, 78.11, 79.28, 80.65, 82.95 (O<sub>2</sub>CCH(OAc)Ph and myoinositol ring carbons), 113.68, 113.73, 113.88, 127.30, 127.49, 127.61, 128.31, 128.84, 129.28, 129.44, 129.61, 129.70, 129.79, 129.86 (CH<sub>2</sub>PhOMe, CH<sub>2</sub>Ph and O<sub>2</sub>CCH(OAc)Ph), 130.43, 130.76, 133.39, 138.68, 159.14, 159.36 (Cq, CH2PhOMe, CH2Ph and O<sub>2</sub>CCH(OAc)Ph), 168.25, 170.74 (OC(O)Me and O<sub>2</sub>CCH-(OAc)Ph); m/z (FAB<sup>-</sup>) 959.5 (100), 805.4 (95), 629.3 (30), 419.3 (30), 331.1 (45), 258.1 (33), 181.1 (40), 149.1 (35).

**22** (Found: C, 69.6; H, 6.18.  $C_{47}H_{50}O_{12}$  requires C, 69.96; H, 6.25%);  $\delta_{H}$  (400 MHz; CDCl<sub>3</sub>) 2.19 [3 H, s, O<sub>2</sub>CCH(OAc)Ph], 2.72 (1 H, s, D<sub>2</sub>O ex, OH), 3.41 (1 H, t, J 9.15, 5-H), 3.47 (1 H, dd, J 2.4, 9.5, 3-H), 3.75 (3 H, s, OMe), 3.76 (3 H, s, OMe), 3.79 (3 H, s, OMe), 3.92 (1 H, t, J 9.2, 4-H), 4.04 (1 H, t, J 9.8, 6-H),

# D-5-O-Benzyl-1,4,6-tris-O-p-methoxybenzyl-myo-inositol 19a

A mixture of L-1-*O*-[*R*-(-)-*O*-acetylmandelyl]-5-*O*-benzyl-3,4,6-tris-*O*-*p*-methoxybenzyl-*myo*-inositol **22** (2.59 g, 4.10 mmol) and sodium hydroxide (0.8 g, 20 mmol) in methanol (100 cm<sup>3</sup>) was heated under reflux for 30 min. The mixture was cooled and neutralised with carbon dioxide. The remaining solution was diluted with water (100 cm<sup>3</sup>) and evaporated to dryness *in vacuo*. The title compound was extracted with methylene dichloride (4 × 100 cm<sup>3</sup>) and the solvent was evaporated to give the product **19a** (1.86 g, 96%), (*R*<sub>f</sub> 0.40, CH<sub>2</sub>Cl<sub>2</sub>– EtOAc 2 : 1); mp 123–125 °C (from Et<sub>2</sub>O–pentane); [*a*]<sub>D</sub> +24 (*c* 1 in CHCl<sub>3</sub>); (Found: C, 70.4; H, 6.60. C<sub>37</sub>H<sub>42</sub>O<sub>9</sub> requires C, 70.46; H, 6.71%); Mass spectrum and NMR data were identical with those of the racemic mixture **19ab**.

# L-5-O-Benzyl-1,4,6-tris-O-p-methoxybenzyl-myo-inositol 19b

A mixture of D-1-*O*-[*R*-(-)-*O*-acetylmandelyl]-5-*O*-benzyl-3,4,6-tris-*O*-*p*-methoxybenzyl-*myo*-inositol **22** (2.00 g, 4.10 mmol) and sodium hydroxide (0.8 g, 20 mmol) in methanol (100 cm<sup>3</sup>) was heated under reflux for 30 min. Work up as for the D-enantiomer gave the title compound **19b** (1.48 g, 99%), *R*<sub>f</sub> 0.40 (CH<sub>2</sub>Cl<sub>2</sub>-EtOAc 2 : 1); mp 123–125 °C (from Et<sub>2</sub>O-pentane); [*a*]<sub>D</sub> -24 (*c* 1 in CHCl<sub>3</sub>); (Found: C, 70.4; H, 6.65. C<sub>37</sub>H<sub>42</sub>O<sub>9</sub> requires C, 70.46; H, 6.71%); The mass spectrum and NMR data were identical with those of the racemic mixture **19ab**.

# D-3,5-Di-O-benzyl-1,4,6-tris-O-p-methoxybenzyl-myo-inositol 23a

A mixture of D-5-O-benzyl-1,4,6-tris-O-p-methoxybenzyl-myoinositol 19a (1.64 g, 2.6 mmol) and dibutyltin oxide (0.875 g, 3.5 mmol) was heated under reflux in toluene (250 cm<sup>3</sup>) using a Dean-and-Stark apparatus for 3 h. The reaction mixture was cooled and the solvent was evaporated to give a syrup which was dried under vacuum for a further 2 h. Caesium fluoride (1.52 g, 10 mmol) and dry DMF (50 cm<sup>3</sup>) were added to the dried residue under an atmosphere of nitrogen. Benzyl bromide (0.71 cm<sup>3</sup>, 6 mmol) was added to the mixture and the reaction was stirred overnight at room temperature. TLC (CH<sub>2</sub>Cl<sub>2</sub>-EtOAc 10 : 1), showed a product with  $R_f 0.40$ . The solvent was evaporated under reduced pressure and the residue was taken up in methylene dichloride (100 cm<sup>3</sup>), washed with water (100 cm<sup>3</sup>) and stirred with a saturated aqueous solution of sodium hydrogen carbonate (100 cm<sup>3</sup>, 10% w/v) for 30 min. The organic layer was separated, washed with water, dried over MgSO4 and the solvent was evaporated to give the crude product. The title compound 23a was obtained by flash chromatography (CH<sub>2</sub>Cl<sub>2</sub>-EtOAc 10 : 1), to give the pure enantiomer as a solid. Yield (1.55 g, 83%); mp 100–102 °C (from EtOAc–hexane);  $[a]_{D}$  –3 (*c* 1 in CHCl<sub>3</sub>); (Found: C, 73.3; H, 6.70. C<sub>44</sub>H<sub>48</sub>O<sub>9</sub> requires C, 73.31; H, 6.71%);  $\delta_{\rm H}$  (400 MHz; CDCl<sub>3</sub>) 2.50 (1 H, br s, D<sub>2</sub>O ex, OH), 3.34 (1 H, dd, J 2.75, 9.5, 1-H or 3-H), 3.35 (1 H, dd, J 2.75, 9.5, 1-H or 3-H), 3.41 (1 H, t, J 9.5, 5-H), 3.76 (3 H, s,

OMe), 3.77 (3 H, s, OMe), 3.79 (3 H, s, OMe), 3.95 (1 H, t, J 9.2, 4-H or 6-H), 3.98 (1 H, t, J 9.5, 4-H or 6-H), 4.18 (1 H, t, J 2.7, 2-H), 4.63–4.87 (10 H, m, 2 × OCH<sub>2</sub>Ph and 3 × OCH<sub>2</sub>C<sub>6</sub>H<sub>4</sub>OMe), 6.79–7.36 (22 H, m, 2 × CH<sub>2</sub>Ph and 3 × OCH<sub>2</sub>C<sub>6</sub>H<sub>4</sub>OMe);  $\delta_{\rm C}$  (100 MHz; CDCl<sub>3</sub>) 55.23 (CH<sub>2</sub>PhOMe), 67.56, 72.37, 72.69, 75.62, 75.82 (CH<sub>2</sub>Ph and CH<sub>2</sub>PhOMe), 67.56, 79.52, 79.83, 80.94, 83.19 (*myo*-inositol ring carbons), 113.73, 113.82, 127.47, 127.67, 127.80, 128.34, 128.44, 129.48, 129.68 (CH<sub>2</sub>Ph and CH<sub>2</sub>PhOMe), 130.06, 130.91, 130.94, 138.02, 138.82, 159.12, 159.31 (C<sub>q</sub>, CH<sub>2</sub>Ph and CH<sub>2</sub>PhOMe); *m*/*z* (FAB<sup>-</sup>) 873.1 (100), 719.1 (44), 599.4 (22), 329.0 (20), 106.0 (16).

# L-3,5-Di-O-benzyl-1,4,6-tris-O-p-methoxybenzyl-myo-inositol 23b

A mixture of L-5-O-benzyl-1,4,6-tris-O-p-methoxybenzyl-myoinositol 19b (0.90 g, 1.43 mmol) and dibutyltin oxide (0.425 g, 1.7 mmol) was heated under reflux in toluene (100 cm<sup>3</sup>) using a Dean-and-Stark apparatus for 3 h. The reaction mixture was cooled and the solvent was evaporated to give a syrup which was dried under vacuum for a further 2 h. Caesium fluoride (0.65 g, 4.29 mmol) and dry DMF (30 cm<sup>3</sup>) were added to the dried residue under an atmosphere of nitrogen. Benzyl bromide (0.35 cm<sup>3</sup>, 3 mmol) was added to the mixture and the reaction was stirred overnight at room temperature. TLC (CH<sub>2</sub>Cl<sub>2</sub>-EtOAc 10 : 1) showed a product with  $R_f$  0.40. Work up and purification as for the D-enantiomer provided the title compound 23b (0.98 g, 95%); mp 100-102 °C (from EtOAchexane);  $[a]_{D}$  +2 (c 1 in CHCl<sub>3</sub>); (Found: C, 73.0; H, 6.74. C44H48O9 requires C, 73.31; H, 6.71%); The mass spectrum and NMR data were identical to those of the D-derivative.

# D-3,5-Di-O-benzyl-myo-inositol 11a

D-3,5-Di-*O*-benzyl-1,4,6-tris-*O*-*p*-methoxybenzyl-*myo*-inositol **23a** (1.31 g, 1.82 mmol) was added to 1 mol dm<sup>-3</sup> aq. hydrochloric acid–ethanol (60 cm<sup>3</sup>, 1 : 2). The mixture was heated under reflux for 4 h, cooled and the solvents were evaporated *in vacuo* to give a solid, which was co-evaporated with methanol (50 cm<sup>3</sup>). TLC (EtOAc) showed a product  $R_f$  0.20 and deprotected *p*-methoxybenzyl derivative  $R_f$  1.00. The remaining solid was purified by flash chromatography ( $R_f$  0.40 CHCl<sub>3</sub>–MeOH 10 : 1), to give the title compound **11a** as a solid (654 mg, 92%); mp 162–163 °C (from ethanol);  $[a]_D + 5$  (*c* 1 in MeOH); (Found: C, 66.6; H, 6.70. C<sub>20</sub>H<sub>24</sub>O<sub>6</sub> requires C, 66.64; H, 6.72%); The mass spectrum and NMR data were identical with those of racemate **11ab**.

## L-3,5-Di-O-benzyl-myo-inositol 11b

L-3,5-Di-*O*-benzyl-1,4,6-tris-*O*-*p*-methoxybenzyl-*myo*-inositol **23b** (0.675 g, 0.936 mmol) was added to 1 mol dm<sup>-3</sup> aq. hydrochloric acid–ethanol (90 cm<sup>3</sup>, 1 : 2). The mixture was heated under reflux for 4 h, cooled, and the solvents were evaporated *in vacuo* to give a solid, which was co-evaporated with methanol (50 cm<sup>3</sup>). TLC (ethyl acetate) showed a product  $R_f$  0.20 and a deprotected *p*-methoxybenzyl derivative  $R_f$  1.00. The remaining solid was purified by flash chromatography (CHCl<sub>3</sub>–MeOH 10 : 1)  $R_f$  0.40, to give the title compound **11b** as a solid (0.315 g, 93%); mp 162–163 °C (from ethanol);  $[a]_D$  –5 (*c* 1 in MeOH); (Found: C, 66.6; H, 6.68.  $C_{20}H_{24}O_6$  requires C, 66.64; H, 6.72%); The mass spectrum and NMR data were identical with those of racemate **11ab**.

# D-3,5-Di-O-benzyl-1,2,4,6-tetrakis-O-[di(benzyloxy)-phosphoryl]-myo-inositol 13a

A mixture of bis(benzyloxy)diisopropylaminophosphine (1.38 g, 4 mmol) and 1*H*-tetrazole (0.56 g, 8 mmol) in dry methylene dichloride (10 cm<sup>3</sup>) was stirred at room temperature for 10 min. D-3,5-Di-*O*-benzyl-*myo*-inositol **11a** (0.216 g, 0.60 mmol) was added to the reaction mixture and stirred for a further 10 min.

The solution was cooled to 0 °C then (50–60%) MCPBA (1.60 g, 4.6 mmol) was added to the solution and the reaction mixture was stirred for a further 30 min. Work up and purification as for the racemate **13ab** gave the title compound **13a** as a syrup (661 mg, 79%);  $[a]_D - 2.20$  (*c* 7.68 in CHCl<sub>3</sub>); The mass spectrum and NMR data were identical with those of racemate **13ab**.

# L-3,5-Di-O-benzyl-1,2,4,6-tetrakis-O-[di(benzyloxy)phosphoryl]-*myo*-inositol 13b

A mixture of bis(benzyloxy)diisopropylaminophosphine (0.69 g, 2 mmol) and 1*H*-tetrazole (0.28 g, 4 mmol) in dry methylene dichloride (10 cm<sup>3</sup>) was stirred at room temperature for 10 min. L-3,5-Di-*O*-benzyl-*myo*-inositol **11b** (0.108 g, 0.30 mmol) was added to the reaction mixture, which was stirred for a further 10 min. The solution was cooled to 0 °C then (50–60%) MCPBA (0.80 g, 2.3 mmol) was added to the solution and the reaction mixture was stirred for a further 30 min. Work up and purification as for the racemate **13ab** gave the title compound **13b** as a syrup (0.360 g, 86%);  $[a]_D + 2.37$  (*c* 5.05 in CHCl<sub>3</sub>); The mass spectrum and NMR data were identical with those of racemate **13ab**.

# D-myo-Inositol 1,2,4,6-tetrakisphosphate 3a

D-3,5-Di-O-benzyl-1,2,4,6-tetrakis-O-[di(benzyloxy)phosphoryl]-myo-inositol 13a (0.160 g, 0.114 mmol) was hydrogenolysed in a mixture of methanol (40 cm<sup>3</sup>) and water (10 cm<sup>3</sup>), in the presence of palladium on carbon (10%, 0.20 g) for 20 h. The reaction mixture was filtered over a bed of Celite to remove the insoluble components and washed with water and methanol then evaporated in vacuo to give a syrup. The residue was then dissolved in MilliQ water (150 cm<sup>3</sup>) and purified by ion exchange chromatography on Q-Sepharose Fast Flow with a gradient of TEAB buffer (0-1000 mmol dm<sup>-3</sup>) at pH 8.6. The triethylammonium salt of 4a eluted at *ca*. 800 mmol dm<sup>-3</sup>. Yield (74 µmol, 65%);  $[a]_{D}$  –15.4 (c 3.12 in MeOH), lit.<sup>18</sup>  $[a]_{D}$ -15.2 (*c* 2.10, H<sub>2</sub>O, pH 9.5); δ<sub>H</sub> (270 MHz; D<sub>2</sub>O) 3.58 (1 H, t, J 9.2, 5-H), 3.67 (1 H, d, J 9.3, 3-H), 4.08 (1 H, t, J 9.3, 1-H), 4.19 (1 H, q, J 9.0, 4-H or 6-H), 4.29 (1 H, q, J 9.2, 4-H or 6-H), 4.67 (1 H, d, J 9.2, 2-H); δ<sub>P</sub> (109 MHz; D<sub>2</sub>O) 1.78 (1 P, d, J 6.7), 1.32 (2 P, d, J 6.7), 1.07 (1 P, d, J 6.7); m/z (FAB<sup>-</sup>) 999.1 (5), 499.0 (100), 291.2 (5); [Found: m/z, 498.9189 (M - H)<sup>-</sup> requires m/z 498.9208].

#### L-myo-Inositol 1,2,4,6-tetrakisphosphate 4b

L-3,5-Di-O-benzyl-1,2,4,6-tetrakis-O-[di(benzyloxy)phosphoryl]-myo-inositol 13b (0.150 g, 0.107 mmol) was hydrogenolysed in a mixture of methanol (40 cm<sup>3</sup>) and water (10 cm<sup>3</sup>) over palladium on carbon (10%, 0.20 g) for 20 h. The reaction mixture was filtered over a bed of Celite to remove the insoluble components and washed with water and methanol then evaporated in vacuo to give a syrup. The residue was then dissolved in MilliQ water (150 cm<sup>3</sup>) and purified by ion exchange chromatography on Q-Sepharose Fast Flow with a gradient of TEAB buffer (0-1000 mmol dm<sup>-3</sup>) at pH 8.6. The triethylammonium salt of **4b** eluted at *ca*. 800 mmol dm<sup>-3</sup>. Yield (38 µmol, 36%);  $[a]_{\rm D}$  +15 (c 1.6 in MeOH), lit.<sup>18</sup>  $[a]_{\rm D}$  + 14.7 (c 1.77, H<sub>2</sub>O, pH 9.5); δ<sub>H</sub> (270 MHz; D<sub>2</sub>O) 3.57 (1 H, t, J 9.2, 5-H), 3.67 (1 H, d, J 10.1, 3-H), 4.08 (1 H, t, J 9.2, 1-H), 4.21 (1 H, q, J 9.15, 4-H or 6-H), 4.30 (1 H, q, J 9.3, 4-H or 6-H), 4.67 (1 H, d, J 9.2, 2-H); δ<sub>P</sub> (109 MHz; D<sub>2</sub>O) 2.05 (1 P, d, *J* 10.0), 1.72 (1 P, d, *J* 10.1), 1.56 (1 P, d, J 10.1), 1.29 (1 P, d, J 6.8); m/z (FAB<sup>-</sup>) 999.1 (5), 499.0 (100), 291.2 (5); [Found: m/z, 498.9212 (M - H)<sup>-</sup> requires m/z498.9208].

# L-2,3,5-Tri-O-benzyl-1,4,6-tris-O-p-methoxybenzyl-myo-inositol 24b

A mixture of L-5-O-benzyl-1,4,6-tris-O-p-methoxybenzyl-myoinositol **23b** (0.50 g, 0.79 mmol) and sodium hydride (0.33 g,

8.25 mmol) was stirred at room temperature in DMF (25 cm<sup>3</sup>). Benzyl bromide (0.24 cm<sup>3</sup>, 2.0 mmol) was added dropwise and stirred for a further 2 h. TLC (CHCl<sub>3</sub>-pentane-EtOAc 3:3:1) showed a new product  $R_f 0.50$ . The excess sodium hydride was destroyed with methanol (10 cm<sup>3</sup>) and the solvents were evaporated off in vacuo. The residue was partitioned between methylene dichloride and water (50 cm<sup>3</sup> of each) and the organic layer was separated, dried (MgSO<sub>4</sub>) and the solvent was evaporated off to give the crude product. Flash chromatography using the TLC solvent, provided the pure title compound **24b** (0.523 g, 82%); mp 84–86 °C (from Et<sub>2</sub>O–pentane);  $[a]_{D}$  -5 (c 1 in CHCl<sub>3</sub>); (Found: C, 75.6; H, 6.71. C<sub>51</sub>H<sub>54</sub>O<sub>9</sub> requires C, 75.53; H, 6.71%);  $\delta_{\rm H}$  (400 MHz; CDCl<sub>3</sub>) 3.31 (1 H, dd, J 2.4, 9.8, 1-H or 3-H), 3.32 (1 H, dd, J 2.1, 9.8, 1-H or 3-H), 3.44 (1 H, t, J 9.15, 5-H), 3.76 (3 H, s, OMe), 3.77 (3 H, s, OMe), 3.81 (3 H, s, OMe), 4.00 (1 H, t, J 2.1, 2-H), 4.05 (1 H, t, J 9.5, 4-H or 6-H), 4.06 (1 H, t, J 9.5, 4-H or 6-H), 4.52–4.88  $(12 \text{ H}, \text{m}, 3 \times \text{OCH}_2\text{Ph} \text{ and } 3 \times \text{OCH}_2\text{C}_6\text{H}_4\text{OMe}), 6.77-7.42 (27)$ H, m, 3 × CH<sub>2</sub>Ph and 3 × OCH<sub>2</sub>C<sub>6</sub>H<sub>4</sub>OMe);  $\delta_{\rm C}$  (100 MHz; CDCl<sub>3</sub>) 55.23 (CH<sub>2</sub>PhOMe), 72.44, 72.75, 74.08, 75.49, 75.82 (CH<sub>2</sub>Ph, CH<sub>2</sub>PhOMe), 74.47, 80.72, 80.97, 81.42, 83.76 (myoinositol ring carbons), 113.70, 113.75, 127.30, 127.41, 127.50, 127.56, 127.65, 127.76, 128.13, 128.33, 129.15, 129.73 (CH<sub>2</sub>Ph and CH<sub>2</sub>PhOMe), 130.54, 131.03, 131.09, 138.48, 139.01, 159.09, 159.14 (C<sub>q</sub>, CH<sub>2</sub>PhOMe and CH<sub>2</sub>Ph); m/z (FAB<sup>-</sup>) 833.0 (30), 689.0 (90), 391.1 (14), 241.0 (24), 211.0 (78), 121.0 (100).

#### L-2,3,5-Tri-O-benzyl-myo-inositol 25b

- L-2,3,5-Tri-O-benzyl-1,4,6-tris-O-p-methoxybenzyl-myo-ino-
- sitol **24b** (0.390 g, 0.48 mmol) was added to 1 mol dm<sup>-3</sup> aq. hydrochloric acid-ethanol (30 cm<sup>3</sup>, 1 : 2). The mixture was heated under reflux for 4 h, cooled, and the solvents were evaporated in vacuo then the remaining solid was co-evaporated with methanol (50 cm<sup>3</sup>). TLC (ether) showed a new product  $R_{\rm f}$ 0.30 and a deprotected *p*-methoxybenzyl derivative  $R_{\rm f}$  0.80. The remaining solid was partitioned between methylene dichloride and water (50 cm<sup>3</sup> of each) and the organic layer was separated and dried (MgSO<sub>4</sub>) then evaporated to give the crude product. The title compound **25b** was obtained by flash chromatography (EtOAc-CH<sub>2</sub>Cl<sub>2</sub>1:1) and isolated as a solid (0.190 g, 88%); mp 175–176.5 °C (from EtOAc-hexane); lit.,<sup>13</sup> 176–177 °C; [a]<sub>D</sub> – 29 (c 1 in CHCl<sub>3</sub>), lit.,<sup>13</sup>  $[a]_D - 34$  (c 1 in CH<sub>2</sub>Cl<sub>2</sub>); [same sample as lit.,<sup>13</sup>  $[a]_{\rm D}$  -28 (c 1 in CHCl<sub>3</sub>) for the L-enantiomer];  $\delta_{\rm H}$  (270 MHz; CDCl<sub>3</sub>) 2.30-2.70 (3 H, br s, D<sub>2</sub>O ex, OH), 3.24 (1 H, t, J 9.2, 5-H), 3.30 (1 H, dd, J 2.4, 9.7, 1-H or 3-H), 3.40 (1 H, dd, J 2.75, 9.7, 1-H or 3-H), 3.82 (1 H, t, J 9.5, 4-H or 6-H), 4.06 (1 H, t, J 2.6, 2-H), 4.12 (1 H, t, J 9.5, 4-H or 6-H), 4.59–4.99  $(6 \text{ H}, \text{m}, 3 \times \text{OCH}_2\text{Ph}), 7.25-7.40 (15 \text{ H}, \text{m}, 3 \times \text{OCH}_2\text{Ph}).$

#### Acknowledgements

We thank the Wellcome Trust for Programme Grant support (060554 to B. V. L. P.). This work was also supported by a grant from the Action de Rechere Concertée of the Communauté Française de Belgique (to C. E.). We also thank Professor Colin Taylor (University of Cambridge) for preliminary Ca<sup>2+</sup> release studies and Dr Andrew M. Riley for discussion.
