A CONVENIENT SYNTHESIS OF N-FUNCTIONALIZED PERFLUOROALKANESULFONAMIDES

Zohra Benfodda,¹ Franck Guillen,² and Hubert Blancou^{1,2}

¹Institut des Biomolécules Max Mousseron (IBMM), UMR CNRS 5247 Université de Montpellier I et de Montpellier II, Montpellier, France ²S3F Chimie Université de Montpellier II, Montpellier, France

This article describes the synthesis of new N-functionalized perfluoroalkanesulfonamides (5) with two sulfonamides functionalities. Perfluoroalkanesulfonyl fluoride underwent a reaction with 2-chloroethylamine hydrochloride or 3-bromopropylamine hydrobromide to give N-(2-chloroethyl or 3-bromopropyl) perfluoroalkanesulfonamides (1). Reaction of (1) with potassium thiocyanate gave N-(2-thiocyanatoethyl or 3-thiocyanatopropyl) perfluoroalkanesulfonamides (3). The sulfonyl chloride derivatives (4) were prepared by reaction of 3 with sulfuryl chloride. In the last step, 4 reacted with ammonia to give the bis sulfonamides derivatives (5). The structures of all new compounds prepared were determined by 1 H, 19 F, and 13 C NMR spectroscopies and by HR-MS.

Keywords Alkylamine salts; N-functionalized perfluoroalkanesulfonamides; perfluoroalkanesulfonyl fluoride

INTRODUCTION

Sulfonamides are an important class of pharmaceutical compounds that exhibit a wide spectrum of biological activities. This functional group constitutes the largest class of antimicrobial drugs, diuretics, carbonic anhydrase inhibitors, anticonvulsants, hypoglycemics, antithyroids agents, and antitumor drugs, and they exhibit a number of other biological activities as well.^{1–9} Furthermore, some of them have proved to be useful as herbicides and plaguicides.^{10,11} These activities have increased interest in the synthesis of sulfonamides.

The sulfonamides function has been widely studied in the carbohydrogenated compounds around major applications such as hypoglycemic agents, antibiotics, and carbonic anhydrase inhibitors. However investigations on polyfluoroalkanesulfonamides or perfluoroalkanesulfonamides with a long chain have not been carried out in the biological area.

Received 3 July 2009; accepted 23 September 2009.

We gratefully acknowledge the Ministère de l'Education Nationale et de la Recherche for its financial support (Ph.D. grant to Z. Benfodda).

Generally, these fluorinated sulfonamides have been investigated principally for their toxicity, environmental impact of surfactants, surface treatments for clothes, home furnishings, and paper protection properties.^{12–15}

Sulfonamides are usually prepared from substituted sulfonyl chlorides or anhydrides in the presence of a base in an aprotic solvent.^{16–18}

The N-functionalized perfluoroalkanesulfonamides may be synthesized from perfluoroalkanesulfonyl azides or from the sulfonyl fluorides with the corresponding primary amine in the presence of a base.^{16,19–21}

Recently, we have reported the synthesis of perfluoroalkanesulfonamides, and we have studied the inhibition effects of these compounds on bovine carbonic anhydrase.²² In continuation of our research on the synthesis of bioactive perfluoroalkanesulfonamides, we describe in this article the multistep synthesis of new N-functionalized perfluoroalkanesulfonamides, which contain two sulfonamide groups, starting from perfluoroalkanesulfonyl fluoride and alkylamine hydrochloridex or hydrobromides.

RESULTS AND DISCUSSION

The N-(2-chloroethyl or 3-bromopropyl) perfluoroalkanesulfonamides (1) were prepared from the perfluoroalkanesulfonyl fluorides and suitable amine salts with triethylamine (TEA) in EtOAc at 0°C. It is interesting to note that the synthesis of sulfonamides derivatives (1) leads to side products, which were identified as perfluoroalkanesulfonic acid (2) (Scheme 1).

In each case, an excellent conversion of perfluoroalkanesulfonyl fluorides into N-(2chloroethyl or 3-bromopropyl) perfluoroalkanesulfonamides was observed. Recrystallization of these compounds in an ethanol/water mixture (V/V, 90:10) gave the corresponding N-(2-chloroethyl or 3-bromopropyl) perfluoroalkanesulfonamides (**1a–d**) with high purity in moderate to good yields (Table I).

The formation of the perfluoroalkanesulfonic acid (2) was probably related to the hydrolysis of the perfluoroalkanesulfonyl fluoride, which did not react in the presence of water and an excess of TEA after the treatment of the crude product. The formation rate was determined as a function of time using ¹⁹F NMR spectroscopy (Figure 1).

Reactants		Products				
R _F SO ₂ F	Amine salts	1	Conversion ^a (%)	$\operatorname{Yield}^{b}(\%)$	2	Conversion ^a (%)

---------	-------------------	----------------------	-------------------	---------------------	-----------

^{*a*}The conversions were determined by ¹⁹F NMR spectrocopy (d₆-acetone) after treatment of the crude product. They were also determined by the relative integration of the functional CF₂ signal of compounds **1a**, **1b**, **1c**, **1d**, **2a**, and **2b** by the formula (fi/Ni)/(Σ fi/Ni) × 100, where fi represents the height integration of the functional CF₂ signal and Ni the number of corresponding atom.

^bAll these compounds 1 were crystallized in ethanol/water (V/V, 90:10) media.

1907

Figure 1 Formation rate of **1c** and **1d**. The conversions were determined by ¹⁹F NMR spectroscopy (d₆-acetone) after treatment of the crude product (the residue was diluted with water and EtOAc then washed with 1N HCl and water). They were also determined by the relative integration of the functional CF₂ signal respectively of **1c** and **1d** compared with that of the functional CF₂ signal of $C_8F_{17}SO_2F$.

The N-(3-bromopropyl) perfluoroalkanesulfonamides **1a** and **1c** reacted with potassium thiocyanate in absolute ethanol at 100° C for 4 h and yielded the desired N-(3-thiocyanatopropyl) perfluoroalkanesulfonamides **3a** and **3c** in good yields (Scheme 1).

We also employed similar conditions (1.5 eq. of potassium thiocyanate in absolute ethanol at 100°C for 4 h) for the synthesis of N-(2-thiocyanatoethyl) perfluoroalkanesulfonamides **3b** and **3d**, but unfortunately the starting material **1b** and **1d** still remained unreacted (Scheme 1). The chlorine atom was a less suitable leaving group than the bromine atom.

In order to find out the optimum conditions, the reactions of **1d** with potassium thiocyanate were examined under various reaction conditions (Table II). In each case, the formation of **3b** and **3d** were determined by ¹H NMR spectroscopy. When more than 1.5 eq. of potassium thiocyanate in ethanol (protic and polar solvent), in acetone (aprotic and polar solvent), or acetonitrile (aprotic and polar solvent) were used, there was no formation of the desired product (**3b** and **3d**). However, when we used 1.5 eq. of potassium thiocyanate in DMF (solvent with a high dielectric constant) at 100°C for 27 h, the reaction was complete. DMF is a basic solvent that solvates specifically the K⁺ ions and leads to more reactivity of the nucleophile ⁻SCN. It is interesting to note that the reaction time is the same regardless of the length of the F-alkylated chain studied (Table II).

The N-(2-thiocyanatoethyl or 3-thiocyanatopropyl) perfluoroalkanesulfonamides (3) react with sulfuryl chloride in a mixture of acetic acid/water at 50°C to lead to the corresponding alkanesulfonyl chloride derivatives (4a–d) in good yields according to a method developed in our laboratory.

In the last step, the N-functionalized perfluoroalkanesulfonamides (**5a–d**) were prepared by reaction of **4** with gaseous ammonia in EtOAc in good yields. Compounds **5a–d**

In summary, we prepared new N-functionalized perfluoroalkanesulfonamides, which contain two sulfonamides function by a multistep reaction starting from perfluoroalkanesulfonyl fluoride and alkylamine hydrochlorides or hydrobromides. They were obtained in good yields, and they were characterized by ¹⁹F, ¹H, and ¹³C NMR spectroscopies and HRMS.

EXPERIMENTAL

Moisture-sensitive reactions were carried out under dry nitrogen. Different perfluoroalkyl sulfonyl fluorides were prepared according to a method developed in our laboratory.^{23,24} Solvents were distilled from the appropriate drying agents immediately prior to use.

¹H, ¹⁹F, and ¹³C NMR spectra were recorded at 300.13 MHz, 282.37 MHz, and 75.46 MHz, respectively, with a Bruker Avance 300 spectrometer; the chemical shifts are given in ppm relative to Me₄Si for the ¹H and ¹³C, and CCl₃F for ¹⁹F, as internal standards. Coupling constants were given in Hz. Mass spectra and HRMS were recorded on a Jeol SX 102 spectrometer.

Melting points were recorded at atmospheric pressure, unless otherwise stated, on a Stuart Scientific SMP3 apparatus and were uncorrected.

Synthesis of R_FSO₂NH(CH₂)_nX (1): General Procedure (GP1)

To a suspension of 3-bromopropylamine hydrobromide or 2-chloroethylamine hydrochloride (1 eq.) in anhydrous ethyl acetate, triethylamine (2 eq.) and perfluoroalkanesulfonyl fluoride (0.9 eq.) were added at 0°C. The mixture was then stirred at room temperature for 12 h, then poured into water and extracted with ethyl acetate. The organic layer was dried over anhydrous Na₂SO₄ and concentrated under reduced pressure. The crude product was purified by crystallization from EtOH/H₂O (90:10).

Synthesis of N-(3-bromopropyl)-perfluorohexanesulfonamide 1a. Compound **1a** (11.73 g, 55%) was obtained from 3-bromopropylamine hydrobromide (10.0 g, 45.7 mmol) according to the GP1.

Mp: 89–90°C; ¹H NMR (300.13 MHz, d_6 -acetone): δ :2.21 (m, 2H, CH₂CH₂Br), 3.62 (m, 4H, CH₂CH₂CH₂Br), 8.50 (m, 1H, NH); ¹⁹F NMR (282.37 MHz, d_6 acetone): δ : -126.80 (m, 2F, CF₃CF₂), -123.30 (m, 2F, CF₃CF₂CF₂), -122.36 (m, 2F, CF₂(CF₂)₂SO₂), -120.97 (m, 2F, CF₂CF₂SO₂), -113.58 (m, 2F, CF₂SO₂), -81.66 (m, 3F, CF₃); ¹³C NMR (75.46 MHz, d_6 -acetone): δ :30.6 (CH₂), 34.1 (CH₂-CH₂-CH₂), 43.7 (CH₂), 108–120 (C₆F₁₃); MS (FAB⁻) m/z: 518.

Synthesis of N-(2-chloroethyl)-perfluorohexanesulfonamide 1b. Compound **1b** (12.63 g, 71%) was obtained from 2-chloroethylamine hydrochloride (5.0 g, 43.1 mmol) according to the GP1.

Mp: 100–101°C; ¹H NMR (300.13 MHz, d_6 -acetone): δ :3.65 (m, 4H, (CH₂)₂), 8.50 (m, 1H, NH); ¹⁹F NMR (282.37 MHz, d_6 -acetone): δ : -126.77 (m, 2F, CF₃CF₂), -123.30 (m, 2F, CF₃CF₂CF₂), -122.37 (m, 2F, CF₂(CF₂)₂SO₂), -120.94 (m, 2F, CF₂CF₂SO₂), -113.60 (m, 2F, CF₂SO₂), -81.68 (m, 3F, CF₃); ¹³C NMR (75.46 MHz, d_6 -acetone): δ : 42.9 (CH₂), 44.8 (CH₂), 108–120 (C₆F₁₃); MS (FAB⁻) m/z: 460.

Synthesis of N-(3-bromopropyl)-perfluorooctanesulfonamide 1c. Compound **1c** (11.76 g, 46%) was obtained from 3-bromopropylamine hydrobromide (10.0 g, 45.7 mmol) according to the GP1.

Mp: 100–101°C; ¹H NMR (300.13 MHz, d_6 -acetone): δ :2.21 (m, 2H, CH₂CH₂Br), 3.63 (m, 4H, CH₂CH₂CH₂Br), 8.50 (m, 1H, NH); ¹⁹F NMR (282.37 MHz, d_6 acetone): δ : -126.80 (m, 2F, CF₃CF₂), -123.25 (m, 2F, CF₃CF₂CF₂), -122.36 (m, 6F, (CF₂)₃(CF₂)₂SO₂), -120.97 (m, 2F, CF₂CF₂SO₂), -113.52 (m, 2F, CF₂SO₂), -81.68 (m, 3F, CF₃); ¹³C NMR (75.46 MHz, d_6 -acetone): δ :30.5 (CH₂), 34.2 (CH₂-CH₂-CH₂), 43.7 (CH₂), 108–120 (C₈F₁₇); MS (FAB⁻) m/z: 618.

Synthesis of N-(2-chloroethyl)-perfluorooctanesulfonamide 1d. Compound **1d** (21.97 g, 51%) was obtained from 2-chloroethylamine hydrochloride (10 g, 86.2 mmol) according to the GP1.

Mp: $120-121^{\circ}$ C; ¹H NMR (300.13 MHz, d_6 -acetone): δ : 3.75 (m, 4H, (CH₂)₂), 8.50 (m, 1H, NH); ¹⁹F NMR (282.37 MHz, d_6 -acetone): δ : -126.86 (m, 2F, CF₃CF₂(CF₂)₆-), -123.41 (m, 2F, CF₃CF₂CF₂(CF₂)₅-), -122.40 (m, 6F, CF₃(CF₂)₂(CF₂)₃(CF₂)₂-), -121.01 (m, 2F, CF₃(CF₂)₅CF₂CF₂-), -113.73 (m, 2F, CF₃(CF₂)₆CF₂-), -81.86 (m, 3F, CF₃(CF₂)₇); ¹³C NMR (75.46 MHz, d_6 -acetone): δ : 44.1 (CH₂), 46.9 (CH₂), 108–120 (C₈F₁₇); MS (FAB⁻) m/z: 560.

Synthesis of of R_FSO₂NH(CH₂)_nSCN (3): General Procedure (GP2)

These compounds were prepared by reaction of potassium thiocyanate (1.5 eq.) with either **1a** and **1c** (1 eq.) in absolute ethanol or **1b** and **1d** in DMF at 100°C, for 4 h and 27 h,

respectively. After completion and cooling, all volatile parts of the mixture were removed in vacuo. The residue was dissolved in EtOAc and washed successively with water and brine. The organic layer was dried over anhydrous Na₂SO₄, filtered, and evaporated under reduced pressure to yield the corresponding alkyl thiocyanates, which were used in the next step without any purification.

Synthesis of N-(3-thiocyanatopropyl)-perfluorohexanesulfonamide 3a. Compound **3a** (5.05 g, 84%) was prepared starting from **1a** (6.3 g, 12.1 mmol) in absolute ethanol (60 mL) according to the GP2.

Mp: 84–86°C; ¹H NMR (300.13 MHz, d_6 -acetone): δ : 2.21 (m, 2H, CH₂CH₂CH₂), 3.25 (m, 2H, CH₂SCN), 3.55 (m, 2H, NHCH₂), 8.50 (m, 1H, NH); ¹⁹F NMR (282.37 MHz, d_6 -acetone): δ : -126.78 (m, 2F, CF₃CF₂), -123.30 (m, 2F, CF₃CF₂CF₂), -122.36 (m, 2F, CF₂(CF₂)₂S), -120.96 (m, 2F, CF₂CF₂S), -113.59 (m, 2F, CF₂S), -81.68 (m, 3F, CF₃); ¹³C NMR (75.46 MHz, d_6 -acetone): δ : 31.4 (CH₂SCN), 31.6 (CH₂), 43.0 (NHCH₂), 112.7 (SCN), 108–120 (C₆F₁₃); MS (FAB⁻) m/z: 497.

Synthesis of N-(2-thiocyanatoethyl)-perfluorohexanesulfonamide 3b. Compound **3b** (4.77 g, 82%) was prepared starting from **1b** (5.6 g, 12.1 mmol) in DMF (50 mL) according to the GP2.

Mp: 115–117°C; ¹H NMR (300.13 MHz, d_6 -acetone): δ : 3.25 (m, 2H, CH₂SCN), 3.65 (m, 2H, NHCH₂), 8.50 (m, 1H, NH); ¹⁹F NMR (282.37 MHz, d_6 -acetone): δ : –126.90 (m, 2F, CF₃CF₂), –123.43 (m, 2F, CF₃CF₂CF₂), –122.48 (m, 2F, CF₂(CF₂)₂S), –121.04 (m, 2F, CF₂CF₂S), –113.54 (m, 2F, CF₂S), –81.89 (m, 3F, CF₃); ¹³C NMR (75.46 MHz, d_6 -acetone): δ : 34.7 (CH₂SCN), 44.6 (NHCH₂), 112.0 (SCN), 107–121 (C₆F₁₃); MS (FAB⁻) m/z: 522.

Synthesis of N-(3-thiocyanatopropyl)-perfluorooctanesulfonamide 3c. Compound 3c (5.65 g, 63%) was prepared starting from 1c (9.22 g, 14.9 mmol) in absolute ethanol (65 mL) according to the GP2.

Mp: $121-122^{\circ}$ C; ¹H NMR (300.13 MHz, d_{6} -acetone): δ : 2.22 (m, 2H, CH₂CH₂CH₂), 3.25 (m, 2H, CH₂SCN), 3.55 (m, 2H, NHCH₂), 8.50 (m, 1H, NH); ¹⁹F NMR (282.37 MHz, d_{6} -acetone): δ : -126.80 (m, 2F, CF₃CF₂), -123.25 (m, 2F, CF₃CF₂CF₂), -122.36 (m, 6F, (CF₂)₃(CF₂)₂S), -120.97 (m, 2F, CF₂CF₂S), -113.59 (m, 2F, CF₂S), -81.68 (m, 3F, CF₃SCN); ¹³C NMR (75.46 MHz, d_{6} -acetone): δ : 30.7 (CH₂SCN), 31.1 (CH₂), 42.7 (NHCH₂), 111.6 (SCN), 108-120 (C₈F₁₇); MS (FAB⁻) m/z: 597.

Synthesis of N-(2-thiocyanatoethyl)-perfluorooctanesulfonamide 3d. Compound **3d** (5.0 g, 78%) was prepared starting from **1d** (6.2 g, 11.1 mmol) in DMF (55 mL) according to the GP2.

Mp: 118–120°C; ¹H NMR (300.13 MHz, d_6 -acetone): δ : 3.38 (m, 2H, CH₂SCN), 3.77 (m, 2H, NHCH₂), 8.50 (m, 1H, NH); ¹⁹F NMR (282.37 MHz, d_6 -acetone): δ : -126.77 (m, 2F, CF₃CF₂), -123.28 (m, 2F, CF₃CF₂CF₂), -122.25 (m, 6F, (CF₂)₃(CF₂)₂S), -120.90 (m, 2F, CF₂CF₂S), -113.43 (m, 2F, CF₂S), -81.69 (m, 3F, CF₃); ¹³C NMR (75.46 MHz, d_6 -acetone): δ : 34.7 (CH₂SCN), 44.6 (NHCH₂), 111.8 (SCN), 108–120 (C₈F₁₇); MS (FAB⁻) m/z: 583.

Synthesis of of R_FSO₂NH(CH₂)_nSO₂CI (4): General Procedure (GP3)

Compounds **3a–d** dissolved in a mixture of acetic acid (5 eq.) and water (1.5 eq.) were stirred for 30 min at 50°C. Sulfuryl chloride (SO₂Cl₂, 10 eq.) was added dropwise to the reaction mixture at 50°C. This reaction was accompanied by a strong emission of gases (SO₂ and Cl₂), which were trapped with an aqueous solution of NaOH (1 M). The excess of

 SO_2Cl_2 , present in the media, was hydrolyzed by the dropwise addition of water. The crude product was extracted three times with EtOAc. The combined organic extracts were washed three times with water, dried over anhydrous Na₂SO₄, and concentrated, giving a crude material alkanesulfonyl chlorides (**4a–d**), which could be used without any purification.

Synthesis of N-(3-sulfonylchloridepropyl)-perfluorohexanesulfonamide 4a. Compound **4a** (4.59 g, 85%) was obtained from **3a** (5.0 g, 10 mmol) according to the GP3. The excess of SO₂Cl₂ was hydrolyzed by the addition of water (25 mL).

Mp: 114–119°C; ¹H NMR (300.13 MHz, d_6 -acetone): δ : 2.41 (m, 2H, CH₂CH₂CH₂), 3.65 (m, 2H, NHCH₂), 4.22 (m, 2H, CH₂SO₂Cl), 8.50 (m, 1H, NH); ¹⁹F NMR (282.37 MHz, d_6 -acetone): δ : –126.81 (m, 2F, CF₃CF₂), –123.27 (m, 2F, CF₃CF₂CF₂), –122.35 (m, 2F, CF₂(CF₂)₂S), –120.94 (m, 2F, CF₂CF₂S), –113.48 (m, 2F, CF₂S), –81.63 (m, 3F, CF₃); ¹³C NMR (75.46 MHz, d_6 -acetone): δ : 26.6 (CH₂), 42.8 (NHCH₂), 62.8 (CH₂SO₂Cl), 108–120 (C₆F₁₃).

Synthesis of N-(2-sulfonylchlorideethyl)-perfluorohexanesulfonamide 4b. Compound **4b** (4.28 g, 82%) was obtained from **3b** (4.77 g, 9.9 mmol) according to the GP3. The excess of SO₂Cl₂ was hydrolyzed by the addition of water (20 mL).

Mp: 104–106°C; ¹H NMR (300.13 MHz, d_6 -acetone): δ : 4.10 (m, 2H, NHCH₂), 4.45 (m, 2H, CH₂SO₂Cl); ¹⁹F NMR (282.37 MHz, d_6 -acetone): δ : -126.76 (m, 2F, CF₃CF₂), -123.28 (m, 2F, CF₃CF₂CF₂), -122.34 (m, 2F, CF₂(CF₂)₂S), -120.91 (m, 2F, CF₂CF₂S), -113.44 (m, 2F, CF₂S), -81.66 (m, 3F, CF₃); ¹³C NMR (75.46 MHz, d_6 -acetone): δ : 39.8 (NHCH₂), 64.7 (CH₂SO₂Cl), 108–120 (C₆F₁₃).

Synthesis of N-(3-sulfonylchloridepropyl)-perfluorooctanesulfonamide 4c. Compound 4c (5.09 g, 88%) was obtained from 3c (5.42 g, 9.06 mmol) according to the GP3. The excess of SO_2Cl_2 was hydrolyzed by the addition of water (25 mL).

Mp: 116–118°C; ¹H NMR (300.13 MHz, d_6 -acetone): δ : 2.41 (m, 2H, CH₂CH₂SO₂Cl); 3.63 (m, 2H, NHCH₂); 4.15 (m, 2H, CH₂SO₂Cl); 8.52 (m, 1H, NH); ¹⁹F NMR (282.37 MHz, d_6 -acetone): δ : –126.73 (m, 2F, CF₃CF₂), –123.25 (m, 2F, CF₃CF₂CF₂), –122.26 (m, 6F, (CF₂)₃(CF₂)₂S), –120.91 (m, 2F, CF₂CF₂S), –113.45 (m, 2F, CF₂S), –81.64 (m, 3F, CF₃); ¹³C NMR (75.46 MHz, d_6 -acetone): δ : 25.41 (CH₂), 41.60 (NHCH₂), 61.59 (CH₂SO₂Cl), 108–120 (C₈F₁₇).

Synthesis of N-(2-sulfonylchlorideethyl)-perfluorooctanesulfonamide 4d. Compound 4d (2.74 g, 64%) was obtained from 3d (4 g, 6.85 mmol) according to the GP3. The excess of SO_2Cl_2 was hydrolyzed by the addition of water (20 mL).

Mp: 134–136°C; ¹H NMR (300.13 MHz, d_6 -acetone): δ : 4.12 (m, 2H, NHCH₂); 4.42 (m, 2H, CH₂SO₂Cl); 8.71 (m, 1H, SO₂NH); ¹⁹F NMR (282.37 MHz, d_6 -acetone): δ : -126.70 (m, 2F, CF₃CF₂), -123.22 (m, 2F, CF₃CF₂CF₂), -122.27 (m, 6F, (CF₂)₃(CF₂)₂S), -120.83 (m, 2F, CF₂CF₂S), -113.35 (m, 2F, CF₂S), -81.64 (m, 3F, CF₃); ¹³C NMR (75.46 MHz, d_6 -acetone): δ : 40.55 (NHCH₂), 65.08 (CH₂SO₂Cl), 108–120 (C₈F₁₇).

Synthesis of of R_FSO₂NH(CH₂)_nSO₂NH₂ (5): General Procedure (GP4)

The compounds **4a–d** were dissolved in ethyl acetate (30 mL), and gaseous NH₃ was bubbled through the solution for 15 min at room temperature. The mixture was stirred at room temperature for 30 min, then filtered. The organic layer was washed three times with water and brine, dried over anhydrous Na₂SO₄, filtered, and evaporated. The crude product was purified by crystallization from EtOH/H₂O (90:10) to give the title compound.

Synthesis of N-(3-propylsulfonamide)-perfluorohexanesulfonamide 5a. Compound 5a (3.55 g, 93%) was obtained from 4a (4 g, 7.41 mmol) according to the GP4.

Mp: 138–140°C; ¹H NMR (300.13 MHz, d_6 -acetone): δ : 2.15 (m, 2H, CH₂CH₂CH₂CH₂), 3.23 (m, 2H, CH₂SO₂NH₂), 3.61 (m, 2H, NHCH₂), 6.30 (m, 2H, NH₂), 8.41 (m, 1H, NH); ¹⁹F NMR (282.37 MHz, d_6 -acetone): δ : –126.75 (m, 2F, CF₃CF₂), –123.28 (m, 2F, CF₃CF₂CF₂), –122.34 (m, 2F, CF₂(CF₂)₂S), –120.94 (m, 2F, CF₂CF₂S), –113.51 (m, 2F, CF₂S), –81.64 (m, 3F, CF₃); ¹³C NMR (75.46 MHz, d_6 -acetone): δ : 25.3 (CH₂CH₂), 43.0 (NHCH₂), 51.8 (CH₂SO₂), 108–119 (C₆F₁₃); MS (FAB⁻) m/z:519; HRMS calcd for C₉H₈O₄N₂F₁₃S₂: 518.9645; found 518.9635.

Synthesis of N-(2-ethylsulfonamide)-perfluorohexanesulfonamide 5b. Compound 5b (3.90 g, 95%) was obtained from 4b (4.28 g, 8.14 mmol) according to the GP4.

Mp: 149–151°C; ¹H NMR (300.13 MHz, d_6 -acetone): δ : 3.42 (m, 2H, NHCH₂), 3.85 (m, 2H, CH₂SO₂NH₂), 6.60 (m, 3H, NH, NH₂); ¹⁹F NMR (282.37 MHz, d_6 -acetone): δ : -126.75 (m, 2F, CF₃CF₂), -123.27 (m, 2F, CF₃CF₂CF₂), -122.32 (m, 2F, CF₂(CF₂)₂S), -120.92 (m, 2F, CF₂CF₂S), -113.51 (m, 2F, CF₂S), -81.61 (m, 3F, CF₃); ¹³C NMR (75.46 MHz, d_6 -acetone): δ : 40.4 (CH₂), 55.4 (CH₂), 108–119 (C₆F₁₃); MS (FAB⁺) m/z:507; HRMS calcd for C₈H₈O₄N₂F₁₃S₂: 506.9718; found 506.9735.

Synthesis of N-(3-propylsulfonamide)-perfluorooctanesulfonamide 5c. Compound **5c** (3.22 g, 95%) was obtained from **4c** (3.62 g, 5.66 mmol) according to the GP4.

Mp: 158–160°C; ¹H NMR (300.13 MHz, d_6 -DMSO): δ : 1.90 (m, 2H, CH₂CH₂CH₂CH₂), 3.01 (m, 2H, CH₂SO₂NH₂), 3.32 (m, 2H, NHCH₂), 6.85 (m, 2H, NH₂), 9.65 (m, 1H, NH); ¹⁹F NMR (282.37 MHz, d_6 -DMSO): δ : –126.62 (m, 2F, CF₃CF₂), –123.17 (m, 2F, CF₃CF₂CF₂), –122.13 (m, 6F, (CF₂)₃(CF₂)₂S), –120.69 (m, 2F, CF₂CF₂S); –113.49 (m, 2F, CF₂S); –81.40 (m, 3F, CF₃); ¹³C NMR (75.46 MHz, d_6 -DMSO): δ : 25.5 (CH₂CH₂CH₂), 42.8 (NHCH₂), 52.0 (CH₂SO₂), 108–120 (C₈F₁₇); MS (FAB⁻) m/z: 619; HRMS calcd for C₁₁H₈O₄N₂F₁₇S₂: 618.9654; found 618.9641.

Synthesis of N-(2-ethylsulfonamide)-perfluorooctanesulfonamide 5d. Compound 5d (2.25 g, 93%) was obtained from 4d (2.5 g, 4 mmol) according to the GP4.

Mp: $161-162^{\circ}$ C; ¹H NMR (300.13 MHz, d_{6} -acetone): δ : 3.43 (m, 2H, NHCH₂), 3.83 (m, 2H, CH₂SO₂NH₂), 6.50 (m, 3H, NH, NH₂);¹⁹F NMR (282.37 MHz, d_{6} -acetone): δ : -126.71 (m, 2F, CF₃CF₂), -123.22 (m, 2F, CF₃CF₂CF₂), -122.24 (m, 6F, (CF₂)₃(CF₂)₂S), -120.86 (m, 2F, CF₂CF₂S), -113.49 (m, 2F, CF₂S), -81.61 (m, 3F, CF₃);¹³C NMR (75.46 MHz, d_{6} -acetone): δ : 39.1 (CH₂), 54.2 (CH₂), 108–120 (C₈F₁₇); MS (FAB⁺) m/z:607; HRMS calcd for C₁₀H₈O₄N₂F₁₇S₂: 606.9815; found 606.9825.
