the N₂C₅Cl₄ molecule is not known. The Ir-N(1) (1.819, 1.794 Å) and N(1)-N(2) (1.171, 1.159 Å) distances, while similar, are consistent with less π back-bonding from metal to atom N(1) in the N_2R species.

We believe that the route to a variety of metal-N₂R complexes described here is a general one and that the comparative reaction and structural chemistry of these complexes and their CO, NO+, and N₂Ph+ analogues will prove to be diverse and interesting.

Acknowledgments. This research was supported by the National Science Foundation. We thank Matthey Bishop Inc. for the generous loan of iridium.

A Total Synthesis of Lasalocid A

Sir:

Lasalocid A (1), produced by Streptomyces lasaliensis, is a member of the class of naturally occurring ionophores known as polyether antibiotics. Isolation, structure elucidation, 3,4

biosynthesis,⁵ and biological activity⁶ of lasalocids have been reported. Polyether antibiotics present a formidable challenge for synthetic chemists; lasalocid A has ten chiral centers on the carbon backbone. We would like to report the first total synthesis of lasalocid A (1) with regio- and stereocontrol.

(4E,8E)-Ethyl 2-methyl-4,8-diethyldecadienoate (2)⁷ (bp 88-90 °C (0.17 mmHg); ¹H NMR (CDCl₃) δ 5.12 (1 H, t, J= 7 Hz), 5.17 (1 H, q, J = 7 Hz)), readily synthesized by adapting Johnson's method,8 was converted to the aldehyde 3^7 (bp 83–85 °C (0.22 mmHg); ¹H NMR (CDCl₃) δ 5.10 (1 H, t, J = 7 Hz), 5.14 (1 H, q, J = 7 Hz), 9.59 (1 H, d, J = 2Hz)) in 95% yield by two steps: (1) LiAlH₄/Et₂O, room temperature; (2) pyridinium chlorochromate/CH₂Cl₂, room temperature.9 Treatment of 3 with p-methoxyphenylmag-

nesium bromide in ether, followed by Jones oxidation, gave the ketone 4^7 (oil; ¹H NMR (CDCl₃) δ 5.06 (1 H, t, J = 7 Hz), 5.10 (1 H, q, J = 7 Hz)) in 72% overall yield. Highly stereospecific reduction of 4 to the alcohol 5⁷ (oil; ¹H NMR (CDCl₃) δ 4.36 (1 H, d, J = 7 Hz), 5.10 (1 H, t, J = 7 Hz), 5.13 (1 H, q, J = 7 Hz) was realized by a combination of lithium aluminum hydride and dl-2-(o-toluidinomethyl)pyrrolidine.¹⁰ Assignment of the stereochemistry of 5 was made based on Cram's rule. 11 The ratio of 5 and its diastereomer obtained by this method was at least 10:1 (97% yield), whereas other reducing reagents including hindered borohydrides gave less satisfactory results. 12 Optical resolution of 5 was achieved by preparative HLC separation of the l- α -methylbenzylurethane derivative of 5.13

Epoxidation of the levorotatory alcohol 5 (t-BuOOH/VO-(acac)₂/NaOAc/C₆H₆, room temperature¹⁴), followed by acetic acid workup, gave the tetrahydrofuran 67 (75% yield; oil; ¹H NMR (CDCl₃) δ 3.65 (1 H, br), 4.30 (1 H, d, J = 9Hz), 5.20 (1 H, q, J = 7 Hz)) along with a small amount of its stereoisomer in a ratio of 8:1.15 As the C-1516 hydroxy group was expected to control the stereochemistry of the epoxidation reaction, 15 structure 6 was assigned to the major product. Repetition of epoxidation of 6 under the same conditions, followed by acetylation (Ac₂O/Py, room temperature), 17 allowed isolation of the epoxide 7⁷ (oil; ¹H NMR (CDCl₃) δ 2.82 (1 H, q, J = 6 Hz), 4.25 (1 H, d, J = 9 Hz), 5.03 (1 H, br)),which was transformed to the tetrahydrofuran 8⁷ (oil; ¹H NMR (CDCl₃) δ 3.72 (1 H, q, J = 7 Hz), 4.08 (1 H, m), 4.28 $(1 \text{ H, d}, J = 10 \text{ Hz}); [\alpha]^{22}D + 1.74^{\circ} (c 1.44, \text{CHCl}_3))$ by four steps ((1) 0.1 N H₂SO₄/aqueous acetone, room temperature;¹⁸ (2) TsCl/Py, room temperature; (3) K₂CO₃/CH₃OH, room temperature; (4) AcOH, room temperature) in 45% overall yield. The first three steps were necessary to invert the stereochemistry of the epoxide ring. The overall stereoselectivity

from 6 to 8 and its stereoisomer was 5:1. Bromomethyl methyl ether treatment of 8 (KH/THF, room temperature) gave the ether 9^7 (oil; ¹H NMR (CDCl₃) δ 3.64 (1 H, q, J = 7 Hz), 3.95 $(1 \text{ H, m}), 4.35 (1 \text{ H, d}, J = 9 \text{ Hz}); [\alpha]^{22}D - 25.4^{\circ} (c 1.80,$ CHCl₃)) in 88% yield.

Functionalization required for introduction of the ethyl ketone moiety to 9 was achieved by eight steps: (1) Li/ EtOH/liquid NH₃; (2) MCPBA/aqueous NaHCO₃/CH₂Cl₂, room temperature; (3) HIO₄/aqueous dioxane, room temperature; (4) LiAlH₄/THF, reflux; (5) TsCl/Py, 0 °C; (6) LiAlH₄/Et₂O, room temperature; (7) B₂H₆/THF, room temperature; (8) Jones oxidation. Deprotection of the alcoholic group (TrBF₄/CH₂Cl₂, room temperature¹⁹) yielded exclusively the ketone 10^7 (oil; ¹H NMR (CDCl₃) δ 3.53 (1 H, dd, J = 9, 5 Hz), 3.62 (1 H, q, J = 7 Hz), 3.95 (1 H, distorted t, J = 8 Hz; $[\alpha]^{22}D + 18.9^{\circ} (c \ 0.36, \text{CHCl}_3)$). The overall yield from 9 to 10 was 13%. The stereochemistry at the C-14 position was deduced by comparison with the authentic ketone 11, prepared from natural isolasalocid A.4,20 Equilibration of 10 (NaOH/aqueous dioxane, room temperature) resulted in a 1:1 mixture (93% recovery) of 10 and 11, which was well separated by silica gel preparative TLC (hexane-ether, 2:1). The recovered ketone 10 was recycled. The synthetic ketone 11⁷ (oil; ¹H NMR (CDCl₃) δ 3.56 (1 H, dd, J = 9, 7 Hz), 3.75 (1 H, q, J = 7 Hz), 3.98 (1 H, distorted t, J = 7 Hz); $[\alpha]^{22}$ _D -27.1° (c 1.69, CHCl₃)) was identical with the authentic ketone^{4,20} in every respect (mass spectrum, NMR, IR, α_D , TLC).

The ketone 11, belonging to the isolasalocid^{4,20} series, was stereospecifically converted to the ketone 12, belonging to the lasalocid series, in two steps; methanesulfonyl chloride-pyridine treatment of 11 afforded the mesylate, solvolysis of which in aqueous acetone in the presence of silver carbonate at room temperature gave a mixture of the ketones 127 (65% yield; oil; ¹H NMR (CDCl₃) δ 0.74–1.10 (5 × 3 H), 1.20 (3 H, d, J = 7 Hz), \sim 2.5 (3 H, m), \sim 3.5 (2 H, m), 3.75 (1 H, q, J = 7 Hz); $[\alpha]^{22}$ D -23.7 ° (c 0.19, CHCl₃)) and 11 (12% yield) which was recycled. The synthetic ketone 12 was identical with the authentic ketone, prepared from natural lasalocid A,3,20 in every respect (mass spectrum, NMR, IR, α_D , TLC).

The left half of the lasalocids was synthesized as follows. Treatment of 2-acetoxy-2-methyl-6-carbobenzoxy-3,5-cyclohexadien-1-one²¹ with lithium di(3-methyl-4-pentenyl)cuprate, prepared from l-1-bromo-3-methyl-4-pentene ($[\alpha]^{22}$ _D -4.77° (c 3.02, CH₃OH)), gave the benzyl salicylate 13.7 Ozonization of 13 in a mixture of methylene chloride and methanol at -78°, followed by dimethyl sulfide workup, afforded the aldehyde 14⁷ (mp 29–30 °C; ¹H NMR (CDCl₃) δ 0.92 (3 H, d, J = 7 Hz), 2.20 (3, H, s), 5.37 (2 H, s), 6.57 and7.53 (2 H, AB, J = 8 Hz), 9.34 (1 H, d, J = 2 Hz), 11.29 (1 H, s); $[\alpha]^{22}D - 0.92^{\circ}$ (c 0.65, CHCl₃)). The overall yield from the cyclohexadienone to 14 was 50%. The synthetic aldehyde was identical with the authentic substance, prepared from lasalocid A,^{20,23} in every respect (mass spectrum, NMR, IR, UV, α_D , TLC).

We anticipated that the major product of the Aldol reaction between 12 and 14 would have the desired stereochemistry at the C-10, C-11, and C-12 positions, based on Cram's rule¹¹ and House's experiments.²⁴ After many unsuccessful attempts, this crucial step was realized using a procedure similar to that reported by House, which involved (1) LDA (2.2 equiv) treatment of 12 (1.0 equiv) in Et₂O at 0 °C; (2) ZnCl₂ (2.2 equiv) treatment of the resultant enolate at 0 °C; and (3) treatment of the resultant zinc enolate with 14 (1.0 equiv) at 0 °C for 3 min. Silica gel preparative TLC (hexane-ether 1:1) allowed isolation of four Aldol products (67% yield; 96% yield based on the recovered 14), the ratio of which was 40:10:7:3.25 As expected, the major product (oil; ${}^{1}H$ NMR (CDCl₃) δ 0.73-1.05 (6 × 3 H), 1.17 (3 H, d, J = 7 Hz), 2.19 (3 H, s), 2.4-3.2 (4 H), 3.3-3.95 (4 H), 5.40 (2 H, s), 6.60 and 7.10 (2 H, AB, J = 8 Hz), 7.35 (5 H), 11.25 (1 H, s); $[\alpha]^{22}$ D -2.80° (c 0.80, CH₃OH)) was identical with benzyl lasalocid A (15),⁷ prepared from natural lasalocid A,20,23 in every respect (mass spectrum, NMR, IR, UV, α_D , TLC). The stereochemistry of the minor products has not yet been established. Better stereoselectivity (~8:1:1 for the first three isomers) of the Aldol reaction was observed in DME, but the efficiency of condensation was lower (~20% uncorrected yield). Buse and Heathcock²⁶ recently reported a different stereochemical outcome for the Aldol reaction in a similar system, due to different reaction conditions employed for these experiments. It is interesting to point out that the stereochemistry around the β -hydroxy ketone moiety (or its masked form) of some other polyether antibiotics such as salinomycin,²⁷ narasin,²⁸ lysocellin,²⁹ A23187,³⁰ monensin,³¹ and dianemycin³² is the same as that of the lasalocids.

Debenzylation of 15 was carried out under the standard conditions $(H_2/Pd \text{ on } C/MeOH, \text{ room temperature})$, and synthetic lasalocid A $(1)^7$ was quantitatively isolated as its sodium salt. The synthetic substance was identical with the sodium salt of natural lasalocid A20 in every respect (melting point, mixture melting point, NMR, IR, UV, α_D , TLC).

An Anionic Equivalent of the Friedel-Crafts Cycloacylation [J. Am. Chem. Soc., 99, 4822 (1977)]. By R. J. BOATMAN, B. J. WHITLOCK, and H. W. WHITLOCK, JR.,* Department of Chemistry, University of Wisconsin—Madison, Madison, Wisconsin 53706.

It has been called to our attention that our references 4 and 6 to Professor W. E. Parham's work in this area were not very explicit. Since our primary concern is with the synthesis of anthracyclinones, we did not give a detailed literature review, but we would point out now that a comparable synthesis of 1-indanone by him is described in the paper referred to in ref 6, which also indicates the potential generality and utility of this synthetic approach.

Experimental Section, page 5287, line 11: For "The solution was concentrated to ca. 200 mL \dots ", read "The solution was concentrated to ca. 50 mL . . . ".

Orientation in Nucleophilic Substitution at the Cycloheptatrienone Nucleus: Failure of Predictions from Either Electron Spin Resonance Data or Molecular Orbital Treatments [J. Am. Chem. Soc., 99, 5997 (1977)]. By MARINO CAVAZZA, M. PERLA COLOMBINI, MASSIMO MARTINELLI, LAMBERTO NUCCI, LUCIO PARDI, FRANCESCO PIETRA,* and SERGIO SANTUCCI, Department of Chemistry and GNSM, Istituto di Fisica, Università di Pisa, 56100 Pisa, Italy, and Facoltà di Scienze, Libera Università di Trento, 38050 Povo (Trento),

UV data for 3-thiomethyltropone are correct as they stand in Table VI while those reported in the Experimental Section refer instead to 2-thiomethyltropone.
