Received April 28, 2005

The novel three- μ -CO-containing trianions {[(μ -CO)Fe₂(CO)₆]₃[(μ -SCH₂ CH₂)₃N]}³⁻ (**4A**) and {[(μ -CO)Fe₂(CO)₆]₃[1,3,5-(μ -SCH₂)₃C₆H₃]}³⁻ (**4B**) were prepared by reaction of trithiol N(CH₂CH₂SH)₃ or 1,3,5-(HSCH₂)₃C₆H₃ with Fe₃(CO)₁₂ and Et₃N in 1:3:3 molar ratio in THF at room temperature. Further in situ treatment of **4A** with electrophiles Ph₂PCl, PhSBr, PhC(Cl)=NPh, and CH₂=CHCH₂Br afforded starlike complexes [(μ -Y)Fe₂(CO)₆]₃-[(μ -SCH₂CH₂)₃N] (**5-8**: Y = Ph₂P, PhS, PhC=NPh, CH₂=CHCH₂), whereas its reaction with CS₂ followed by treatment with organic halides RX produced complexes [(μ -Y)Fe₂(CO)₆]₃-[(μ -SCH₂CH₂)₃N] (**9-11**: Y = MeSC=S, PhCH₂SC=S, CH₂=CHCH₂SC=S). Similarly, **4B** reacted in situ with Ph₂PCl, PhSBr, PhC(Cl)=NPh, CH₂=CHCH₂Br, and PhNCS to give starlike complexes [(μ -Y)Fe₂(CO)₆]₃[1,3,5-(μ -SCH₂)₃C₆H₃] (**12-16**: Y = Ph₂P, PhS, PhC=NPh, CH₂=CHCH₂, PhNHC=S), whereas its reaction with CS₂ followed by treatment with RX yielded complexes [(μ -Y)Fe₂(CO)₆]₃[1,3,5-(μ -SCH₂)₃C₆H₃] (**17-19**: Y = MeSC=S, PhCH₂SC=S, CH₂=CHCH₂SC=S). All the starlike complexes **5-19** contain three terminal butterfly Fe/S cluster cores, which have been fully characterized by elemental analysis and spectroscopy, and particularly by X-ray diffraction techniques for **5**, **12**, **15**, and **17**.

Introduction

Iron—sulfur cluster complexes have attracted a great deal of attention because of their unique structures and novel chemical reactivities, and particularly their practical applications such as the use as biomimetic models for the active sites of nitrogenase and the Feonly hydrogenase. Among such cluster complexes the μ -CO-containing butterfly Fe/S cluster anions $(\mu$ -CO)(μ -RS)Fe₂(CO)₆ (1), $(\mu$ -CO)(μ -RS)[Fe₂(CO)₆]₂- $(\mu$ ₄-S) (2), and $[(\mu$ -CO)Fe₂(CO)₆]₂(μ -SZS- μ) (3) (Scheme 1) are of interest in terms of their ready availability and high nucleophilicity toward diverse electrophiles. $^{4-6}$ While the one- μ -CO-containing single-butterfly monoan-

the presence of Et₃N,^{4a} we made the double-butterfly one-μ-CO-containing monoanion **2** in 2000 via reaction of the Grignard reagent RMgX with μ-S₂Fe₂(CO)₆ followed by treatment of the intermediate S-centered anion $(\mu-S^-)(\mu-RS)Fe_2(CO)_6$ with $Fe_3(CO)_{12}$.^{5a} In 2002 we further prepared the two- μ -CO-containing double-butterfly dianion 3 by reaction of Fe₃(CO)₁₂ with dithiol HSZSH and Et₃N.^{6a} So far, these complex anions 1-3 have been demonstrated to be versatile reagents for synthesizing a wide variety of Fe/S cluster complexes.⁴⁻⁶ To further develop the chemistry of Fe/S cluster complexes, we recently initiated an investigation on formation and reactivities of two novel triple-butterfly three- μ -CO-containing trianions {[(μ -CO)Fe₂(CO)₆]₃- $[(\mu-SCH_2CH_2)_3N]$ ³⁻ (4A) and $\{[(\mu-CO)Fe_2(CO)_6]_3$ - $[1,3,5-(\mu-SCH_2)_3C_6H_3]$ ³⁻ (**4B**) (Scheme 1), aimed at obtaining the starlike complexes terminated with three Fe/S cluster cores. In a previous communication, we preliminarily reported the formation of trianions 4A and 4B, as well as their in situ reactions with some electrophiles leading to five starlike cluster complexes. Now, in this paper we will report the formation of trianions **4A** and **4B** in detail and the systematic study concerning their reactivities toward various electrophiles to produce 15 starlike complexes. In addition, the structural characterization of all the products, including the singlecrystal structures of four representative products, will also be described.

Results and Discussion

Formation and Reactivities of the [Et₃NH] Salt of Trianion $\{[(\mu\text{-CO})\text{Fe}_2(\text{CO})_6]_3[(\mu\text{-SCH}_2\text{CH}_2)_3\text{N}]\}^{3-}$ (4A). Synthesis and Characterization of Starlike Complexes $[(\mu-Y)Fe_2(CO)_6]_3[(\mu-SCH_2CH_2)_3N]$ (5-11: $Y = Ph_2P$, PhS, PhC=NPh, $CH_2=CHCH_2$, MeSC=S, PhCH₂SC=S, CH₂=CHCH₂SC=S). Treatment of the nitrogen-containing trithiol N(CH₂CH₂SH)₃ with Fe₃(CO)₁₂ and Et₃N in 1:3:3 molar ratio in THF at room temperature resulted in formation of the [Et₃NH] salt of trianion 4A (Scheme 2). The IR spectrum of the [Et₃NH] salt of trianion **4A** in THF displayed a medium absorption band at 1742 cm⁻¹ for its μ -CO ligands, which is similar to those displayed by the [Et₃NH] salts of the one- μ -CO-containing monoanion 1 (R = Et)^{4a} and the two- μ -CO-containing dianion 3 (Z = CH₂(CH₂OCH₂)₃CH₂).^{6a,b} Further in situ treatment of the [Et₃NH] salt of trianion **4A** with the electrophiles containing a leaving group such as Ph₂PCl, PhSBr, PhC(Cl)=NPh, and CH₂=CHCH₂Br through nucleophilic attack of the three negatively charged Fe atoms in 4A at the S, P, or C atom bearing the leaving group followed by displacement of the three μ -CO ligands in

each of the corresponding intermediates afforded products 5-8 (Scheme 2).

However, when the [Et₃NH] salt of trianion 4A was treated in situ with an electrophile CS2 without a leaving group, the [Et₃NH] salt of an S-centered trianion was formed via nucleophilic attack of the three negatively charged Fe atoms in **4A** at the three C atoms in three molecules of CS_2 followed by loss of the three μ -CO ligands in **4A**. This type of S-centered trianion could be alkylated in situ with an alkyl halide MeI, PhCH₂Br, or CH₂=CHCH₂Br to give products 9-11 (Scheme 3).

Products 5-11 are air-stable solids, which were characterized by elemental analysis and spectroscopy. For instance, the IR spectra of 5-11 showed three absorption bands in the region 2085-1972 cm⁻¹ for their terminal carbonyls, whereas those of 7 and 9-11 displayed one additional absorption band at 1557 cm⁻¹ for the bridged C=N double bonds^{8,9} or at ca. 1015 cm⁻¹ for the bridged C=S double bonds, 10,11 respectively. In addition, the ³¹P NMR spectrum of **5** showed one singlet at 142.45 ppm for its three identical P atoms, which is very similar to the spectra displayed by single- and double-butterfly Fe $_2$ SP cluster complexes. 6b,12 The ¹H NMR spectra of the methylene groups attached to the three bridged S atoms in 5-11 showed one signal (a triplet or a multiplet) at the chemical shift greater than 2.2 ppm, which indicates that the methylene groups are most likely attached to the bridged S atoms by an equatorial type of bond. This is because the chemical shifts of the axial and equatorial Me groups in the a/e isomer of $(\mu\text{-MeS})_2\text{Fe}_2(\text{CO})_6$ are 1.62 and 2.13 ppm, respectively. 13

Formation and Reactivities of the [Et3NH] Salt of Trianion $\{[(\mu\text{-CO})\text{Fe}_2(\text{CO})_6]_3[1,3,5\text{-}(\mu\text{-SCH}_2)_3\text{-}$ $C_6H_3]$ ³⁻ (4B). Synthesis and Characterization of Starlike Complexes $[(\mu-Y)Fe_2(CO)_6]_3[1,3,5-(\mu-SCH_2)_3 C_6H_3$] (12-19: Y = Ph₂P, PhS, PhC=NPh, CH₂= CHCH₂, PhNHC=S, MeSC=S, PhCH₂SC=S, CH₂= CHCH₂SC=S). The benzene ring-containing trithiol 1,3,5-(HSCH₂)₃C₆H₃ could also react with Fe₃(CO)₁₂ and Et₃N in 1:3:3 molar ratio in THF at room temperature to give the [Et₃NH] salt of trianion **4B** (Scheme 4). The IR spectrum of 4B in THF, similar to the IR spectra of anions 1 (R = Et), 4a 3 (Z = CH₂(CH₂OCH₂)₃CH₂), 6a,b and **4A**, showed one medium absorption band at 1738 cm⁻¹ typical of its μ -CO ligands. Further treatment of the $[Et_3NH]$ salt of trianion $\mathbf{4B}$ with electrophiles such as Ph₂PCl, PhSBr, PhC(Cl)=NPh, CH₂=CHCH₂Br, and PhNCS or with electrophile CS₂ followed by treatment with organic halides RX, via pathways similar to those leading to 5-11, gave rise to products 12-19 (Schemes 4 and 5).

The starlike complexes 12–19 are air-stable solids, which have been characterized by elemental analysis and spectroscopy. For example, the IR spectra of

12-19 displayed three absorption bands in the range $2073-1955~{\rm cm^{-1}}$ for their terminal carbonyls. In addition, while the IR spectrum of 14 showed one additional absorption band at $1557~{\rm cm^{-1}}$ for its bridged C=N double bonds, 8,9 16-19 displayed one additional band in the range $1026-1016~{\rm cm^{-1}}$ for their bridged C=S double bonds. 10,11 The ^{31}P NMR spectrum of 12 exhibited one singlet at 141.31 ppm for its three identical P atoms, which is almost the same as that displayed by the triple-butterfly Fe₂PS cluster 5 and very close to those

displayed by the single- and double-butterfly Fe₂PS cluster complexes. 6b,12 It is worth pointing out that the three methylene groups in **12–19** are probably bound to the bridged S atoms by equatorial bonds. This is because in their 1 H NMR spectra the methylene groups showed only one signal (a singlet or a multiplet) at the chemical shift (>3.5 ppm) which is very close to that (3.67 ppm) of the equatorial CH₂ group in the a/e isomer of (μ -PhCH₂S)₂Fe₂(CO)₆. 13 Fortunately, the spectroscopically characterized structural features for **5–19** mentioned above have been unambiguously confirmed by X-ray crystallographic studies of complexes **5**, **12**, **15**, and **17** (vide infra).

Crystallographic Studies on 5, 12, 15, and 17. To confirm the starlike structures of 5–19, X-ray crystallographic studies on 5, 12, 15, and 17 were undertaken. Their ORTEP drawings are shown in Figures 1–4, whereas Tables 1–4 list their selected bond lengths and angles, respectively.

As can be seen in Figures 1 and 2, both **5** and **12** contain three identical Fe₂SP butterfly cluster cores in which each of the P atoms is attached to two phenyl groups and each of the Fe atoms is attached to three terminal CO ligands. In addition, the three butterfly Fe₂SP cluster cores in **5** are connected through their S atoms to three β -C atoms of the central triethyl-

eneamine structural unit by three equatorial bonds (for example, the nonbonded angle $C(2)-S(1)\cdots P(1)=161.1^{\circ}$, while those in 12 are bound through their S atoms to three α-C atoms of the central trimethylenebenzene moiety by three equatorial bonds (for example, the nonbonded angle $C(19)-S(1)\cdots P(1) = 161.3^{\circ}$). Such conformational arrangements are necessary to avoid the strong axial-axial repulsions between the axially bonded bulky phenyl groups at P atoms and the central part of the starlike complex. 13,14 To our knowledge, 5 and 12 are the first examples of the crystallographically characterized triple-butterfly Fe₂PS cluster complexes, although the crystallographically characterized singlebutterfly Fe₂PS clusters (μ -PhS)(μ -Ph₂P)Fe₂(CO)₆,¹⁵ $(\mu-t-BuS)(\mu-Ph_2P)Fe_2(CO)_6$, and $(\mu-t-BuS)(\mu-PhClP)$ Fe₂(CO)₆¹⁷ were known.

Figures 3 and 4 show that **15** and **17** have three identical butterfly Fe₂SC₃ and Fe₂S₂C cluster cores,

respectively. In 15 the C-C bond lengths of the allyl ligands (for example, C(19)-C(20) = 1.374 (11) Å and C(20)-C(21) = 1.394 (9) Å) lie between the values reported for the C-C single and C=C double bonds, indicating that the ligands are best regarded as delocalized π -allyl ligands. ¹⁸ In **17** the bridged C=S double bonds (for example, the double bond C(28)=S(4) =1.654(12) Å) is slightly shorter than its neighboring single bond C(28)-S(5) (1.695(10) Å), but markedly shorter than the remote single bonds S(5)-C(29) (1.818-(11) Å) and S(1)-C(25) (1.826(9) Å). In addition, the three identical cluster cores in 15 and 17 are joined together by connecting their S atoms with three benzylic C atoms of the planar trimethylene benzene ring moiety also via three equatorial bonds (for example, for 15 the nonbonded angle $C(28)-S(1)\cdots C(20) = 161.8^{\circ}$ and for **17** the nonbonded angle $C(25)-S(1)\cdots S(4) = 168.1^{\circ}$. ^{13,14} In fact, the basic geometry of the cluster cores in 15 is very similar to that of the single-butterfly cluster complex (μ -EtS)(μ -CH₂=CHCH₂)Fe₂(CO)₆. ¹⁸ It is worthy of note that although some double-butterfly Fe₂S₂C clusters were recently crystallographically characterized, ^{6a,b} **17** is the first crystallographically characterized triple-butterfly Fe₂S₂C cluster compound.

In summary, we have synthesized and fully characterized the first examples of the starlike complexes with three terminal butterfly Fe₂SP, Fe₂S₂, Fe₂CNS, Fe₂C₃, or Fe₂S₂C cluster cores and a pyramidal N atom or a planar benzene ring at the central part of the complexes. The easy availablity of trianions **4A** and **4B** from reaction of trithiol N(CH₂CH₂SH)₃ or 1,3,5-(HSCH₂)₃C₆H₃ with Fe₃(CO)₁₂ and Et₃N, as well as their high nucleophilicity toward electrophiles, would make them very useful synthons in the development of transition metal chemistry.

Experimental Section

General Comments. All reactions were carried out under an atmosphere of prepurified nitrogen by using standard Schlenk and vacuum-line techniques. Tetrahydrofuran (THF) was distilled from Na/benzophenone ketyl under nitrogen. Fe₃(CO)₁₂, ¹⁹ Ph₂PCl, ²⁰ N(CH₂CH₂SH)₃, ²¹ 1,3,5-(HSCH₂)₃C₆H₃, ²² PhSBr,²³ and PhC(Cl)=NPh²⁴ were prepared according to literature procedures. Et₃N, CS₂, MeI, PhCH₂Br, CH₂=CHCH₂-Br, and PhNCS were of commercial origin and used without further purification. Preparative TLC was carried out on glass plates $(25 \times 15 \times 0.25 \text{ cm})$ coated with silica gel G (10-40 μ m). IR spectra were recorded on a Bio-Rad FTS 135 infrared spectrophotometer. ¹H(³¹P) NMR spectra were taken on a Bruker AC-P200 or Bruker Avance 300 NMR spectrometer. Elemental analyses were performed with an Elementar Vario EL analyzer. Melting points were determined on a Yanaco MP-500 apparatus and were uncorrected.

Standard in Situ Preparations of the [Et₃NH] Salts of Trianions $\{[(\mu\text{-CO})\text{Fe}_2(\text{CO})_6]_3[(\mu\text{-SCH}_2\text{CH}_2)_3\text{N}]\}^{3-}$ (4A) and $\{[(\mu\text{-CO})\text{Fe}_2(\text{CO})_6]_3[1,3,5\text{-}(\mu\text{-SCH}_2)_3\text{C}_6\text{H}_3]\}^{3-}$ (4B). septum, and a nitrogen inlet tube was charged with $Fe_3(CO)_{12}$ (0.75 g, 1.5 mmol), THF (20 mL), Et₃N (0.21 mL, 1.5 mmol), and N(CH₂CH₂SH)₃ (0.065 mL, 0.5 mmol) or 1,3,5-(HSCH₂)₃-C₆H₃ (0.114 g, 0.5 mmol). The mixture was stirred at room temperature for 0.5-1 h to give a brown-red solution of ca. $0.5 \text{ mmol of the intermediate salt } 4A \cdot [Et_3NH]_3 \text{ or } 4B \cdot [Et_3NH]_3,$ which was utilized immediately in the following preparations.

Preparation of $[(\mu-Ph_2P)Fe_2(CO)_6]_3[(\mu-SCH_2CH_2)_3N]$ (5). To the above prepared solution of $4A \cdot [Et_3NH]_3$ was added Ph_2PCl (0.36 mL, 2.0 mmol). The mixture was stirred at room temperature for 24 h. Solvent was removed under reduced pressure. The residue was subjected to TLC using acetone/ petroleum ether (v/v = 1:4) as eluent to give 5 (0.255 g, 32%) as a red solid, mp 78-80 °C. Anal. Calcd for C₆₀H₄₂Fe₆-NO₁₈P₃S₃: C, 45.35; H, 2.66; N, 0.88. Found: C, 45.33; H, 2.67; N, 1.00. IR (KBr disk): $\nu_{C=0}$ 2059 (s), 2020 (vs), 1982 (vs) cm⁻¹.

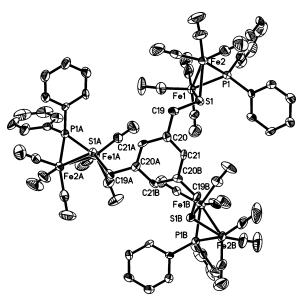

Figure 2. ORTEP drawing of 12 with atom-labeling scheme.

 $CH_2)_3N$] (7). The same procedure was followed as for 6, but PhC(Cl)=NPh (0.54 g, 2.5 mmol) was employed in place of PhSBr. 7 (0.160 g, 20%) was obtained as a red solid, mp 64-66 °C. Anal. Calcd for C₆₃H₄₂Fe₆N₄O₁₈S₃: C, 48.07; H, 2.69; N, 3.56. Found: C, 48.23; H, 2.47; N, 3.64. IR (KBr disk): $\nu_{\rm C=0}$ 2085 (s), 2030 (s), 1972 (vs); $\nu_{\rm C=N}$ 1557 (s) cm⁻¹. ¹H NMR (CDCl₃): 2.76-2.79 (m, 6H, 3SCH₂), 3.04-3.09 (m, 6H, 3NCH₂), 6.51-7.24 (m, 30H, 6C₆H₅) ppm.

Preparation of [(μ -CH₂=CHCH₂)Fe₂(CO)₆]₃[(μ -SCH₂- $CH_2)_3N$] (8). The same procedure was followed as for 6, but CH₂=CHCH₂Br (0.27 mL, 3.0 mmol) was utilized. 8 (0.145 g, 25%) was obtained as a red solid, mp 48-51 °C. Anal. Calcd for C₃₃H₂₇Fe₆NO₁₈S₃: C, 34.26; H, 2.35; N, 1.21. Found: C, 34.28; H, 2.22; N, 1.20. IR (KBr disk): $\nu_{C\equiv 0}$ 2062 (s), 2024 (vs), 1980 (vs) cm $^{-1}.$ $^{1}{\rm H}$ NMR (CDCl₃): 0.47 (d, J=12.4 Hz, 6H, 6 anti-FeCHH), 1.96 (d, J = 6.4 Hz, 6H, 6 syn-FeCHH), 2.472.51(m, 6H, 3SCH₂), 2.62-2.67 (m, 6H, 3NCH₂), 4.69-4.89 (m, 3H, 3CH) ppm.

Preparation of $[(\mu\text{-MeSC=S})\text{Fe}_2(\text{CO})_6]_3[(\mu\text{-SCH}_2\text{CH}_2)_3\text{N}]$ (9). To the above prepared solution of 4A·[Et₃NH]₃ was added CS_2 (0.18 mL, 3.0 mmol). The mixture was stirred for 0.5 h

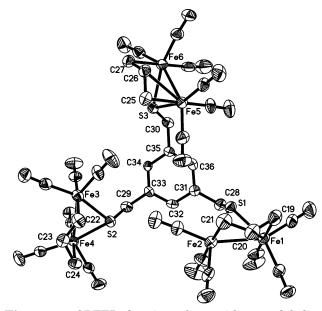

Figure 3. ORTEP drawing of 15 with atom-labeling scheme.

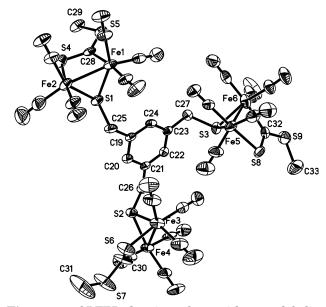

Figure 4. ORTEP drawing of 17 with atom-labeling scheme.

and then MeI (0.18 mL, 3.0 mmol) was added. The mixture was stirred at room temperature for 12 h. Solvent was removed under reduced pressure. The residue was subjected to TLC separation using acetone/petroleum ether (v/v = 1:4) as eluent to give **9** (0.204 g, 31%) as a red solid, mp 41-42 °C. Anal. Calcd for $C_{30}H_{21}Fe_6NO_{18}S_9$: C, 27.54; H, 1.61; N, 1.07. Found: C, 27.60; H, 1.71; N, 1.08. IR (KBr disk): $\nu_{C=0}$ 2067 (s), 2027 (vs), 1993 (vs); $\nu_{C=S}$ 1018 (s) cm $^{-1}.$ ^{1}H NMR (CDCl3): 2.53 (s, 9H, 3CH₃), 2.65-2.72 (m, 6H, 3SCH₂), 2.85-3.05 (m, 6H, 3NCH₂) ppm.

Preparation of $[(\mu-PhCH_2SC=S)Fe_2(CO)_6]_3[(\mu-SCH_2-F)Fe_2(CO)_6]_3[(\mu-FCH_2-F)Fe_2(CO)_6]_3[$ $CH_2)_3N$ (10). The same procedure was followed as for 9, but PhCH₂Br (0.36 mL, 3.0 mmol) and an eluent of acetone/ petroleum ether (v/v = 1:2) were used. 10 (0.304 g, 40%) was obtained as a red solid, mp 59-61 °C. Anal. Calcd for C₄₈H₃₃Fe₆NO₁₈S₉: C, 37.55; H, 2.17; N, 0.91. Found: C,37.64; H, 2.11; N, 1.00. Table 5. Crystal Data and Structural Refinements Details for 5, 12, 15, and 17

Preparation of [(μ-CH₂=CHCH₂SC=S)Fe₂(CO)₆]₃[(μ-SCH₂CH₂)₃N] (11). The same procedure was followed as for **9**, but CH₂=CHCH₂Br (0.27 mL, 3.0 mmol) and an eluent of CH₂Cl₂/petroleum ether (v/v = 1:2) were utilized. **11** (0.185 g, 27%) was obtained as a red solid, mp 43–45 °C. Anal. Calcd for C₃₆H₂₇Fe₆NO₁₈S₉: C, 31.21; H, 1.96; N, 1.01. Found: C, 31.18; H, 2.00; N, 1.10. IR (KBr disk): $\nu_{\text{C=O}}$ 2067 (s), 2028 (vs), 1994 (vs); $\nu_{\text{C=S}}$ 1017 (s) cm⁻¹. ¹H NMR (CDCl₃): 2.69 (br s, 6H, 3SCH₂), 2.92–2.96 (m, 6H, 3NCH₂), 3.72 (d, J = 6.5 Hz, 6H, 3CSCH₂), 5.18–5.27 (m, 6H, 3CH₂=), 5.67–5.76 (m, 3H, 3CH) ppm.

Preparation of [(*μ*-Ph₂P)Fe₂(CO)₆]₃[1,3,5-(*μ*-SCH₂)₃C₆H₃] (12). The above prepared solution of $4B \cdot [Et_3NH]_3$ was cooled to −40 °C. To this cooled solution was added Ph₂PCl (0.26 mL, 1.5 mmol). The mixture was warmed to room temperature and then was stirred for 24 h. Solvent was removed under reduced pressure. The residue was subjected to TLC separation using CH₂Cl₂/petroleum ether (v/v = 1:2) as eluent to give 12 (0.353 g, 44%) as a red solid, mp 106−108 °C. Anal. Calcd for C₆₃H₃₉Fe₆O₁₈P₃S₃: C, 47.05; H, 2.44. Found: C, 47.26; H, 2.48. IR (KBr disk): $\nu_{C=0}$ 2059 (s), 2020 (vs), 1983 (vs) cm⁻¹. ¹H NMR (CDCl₃): 3.84 (s, 6H, 3CH₂), 6.52−7.51 (m, 33H, C₆H₃, 6C₆H₅). ³¹P NMR (121.48 MHz, CDCl₃, 85% H₃PO₄): 141.31 (s) ppm.

Preparation of [(μ-PhS)Fe₂(CO)₆]₃[1,3,5-(μ-SCH₂)₃C₆H₃] (13). To the above prepared solution of 4B·[Et₃NH]₃ was added PhSBr (0.567 g, 3.0 mmol). The mixture was stirred at room temperature for 24 h. After the same workup as for 12, product 13 (0.330 g, 48%) was obtained as a red solid, mp 87–89 °C. Anal. Calcd for C₄₅H₂₄Fe₆O₁₈S₉: C, 39.16; H, 1.75. Found: C, 38.99; H, 1.95. IR (KBr disk): $ν_{C≡0}$ 2073 (s), 2036 (vs), 1997 (vs) cm⁻¹. ¹H NMR (CDCl₃): 3.51–3.62 (m, 6H, 3CH₂), 6.92–7.42 (m, 18H, C₆H₃, 3C₆H₅) ppm.

Preparation of [(μ-PhC=NPh)Fe₂(CO)₆]₃[1,3,5-(μ-SCH₂)₃-C₆H₃] (14). The same procedure was followed as for 13, except that PhC(Cl)=NPh (0.641 g, 3.0 mmol) was used in place of PhSBr. 14 (0.338 g, 42%) was obtained as a red solid, mp 142−143 °C. Anal. Calcd for C₆₆H₃₉Fe₆O₁₈N₃S₃: C, 49.75; H, 2.47, N, 2.64. Found: C, 49.68; H, 2.46; N, 2.50. IR (KBr disk): $\nu_{C=O}$ 2066 (s), 2027 (vs), 1987 (vs), $\nu_{C=N}$ 1557 (m) cm⁻¹. ¹H NMR (CDCl₃): 3.64 (s, 6H, 3CH₂), 6.48−7.51 (m, 33H, C₆H₃, 6C₆H₅) ppm.

Preparation of [(μ-CH₂=CHCH₂)Fe₂(CO)₆]₃[1,3,5-(μ-SCH₂)₃C₆H₃] (15). The same procedure was followed as for 13, except that CH₂=CHCH₂Br (0.27 mL, 3.0 mmol) was used. 15 (0.224 g, 38%) was obtained as a red solid, mp 64–65 °C. Anal. Calcd for C₃₆H₂₄Fe₆O₁₈S₃: C, 36.80; H, 2.06. Found: C, 36.68; H, 2.03. IR (KBr disk): $\nu_{\text{C}=0}$ 2043 (vs), 1989 (vs), 1955 (s) cm⁻¹. ¹H NMR (CDCl₃): 0.47(d, J=12.8 Hz, 6H, 6 anti-FeCHH), 1.96 (d, J=6.4 Hz, 6H, 6 syn-FeCHH), 3.58 (s, 6H, 3CH₂), 4.72–4.84 (m, 3H, 3CH), 7.08 (s, 3H, C₆H₃) ppm.

Preparation of [(μ-PhNHC=S)Fe₂(CO)₆]₃[1,3,5-(μ-SCH₂)₃-C₆H₃] (16). The same procedure was followed as for 13, but PhNCS (0.36 mL, 3.0 mmol) was employed. 16 (0.330 g, 45%) was obtained as a red solid, mp 110–112 °C. Anal. Calcd for C₄₈H₂₇Fe₆O₁₈N₃S₆: C, 39.46; H, 1.86; N, 2.29. Found: C, 39.48; H, 1.88; N, 2.27. IR (KBr disk): $\nu_{C=0}$ 2066 (s), 2026 (vs), 1988 (vs); $\nu_{C=8}$ 1026 (m) cm⁻¹. ¹H NMR (CDCl₃): 3.74–3.94 (m, 6H, 3CH₂), 7.26–7.46 (m, 18H, C₆H₃, 3C₆H₅), 8.67 (s, 3H, 3NH) ppm.

Preparation of [(μ-MeSC=S)Fe₂(CO)₆]₃[1,3,5-(μ-SCH₂)₃-C₆H₃] (17). The above prepared solution of 4B·[Et₃NH]₃ was cooled to −40 °C. To this cooled solution was added CS₂ (0.18 mL, 3.0 mmol). The mixture was stirred at this temperature for 1 h, and then MeI (0.19 mL, 3.0 mmol) was added. The mixture was warmed to room temperature and then was stirred for 24 h. Solvent was removed under reduced pressure. The residue was subjected to TLC separation using CH₂Cl₂/petroleum ether (v/v = 1:2) as eluent to give 17 (0.297 g, 45%) as a red solid, mp 56−58 °C. Anal. Calcd for C₃₃H₁₈Fe₆O₁₈S₉: C, 29.89; H, 1.37. Found: C, 30.07; H, 1.40. IR (KBr disk): $\nu_{C\equiv 0}$ 2066 (s), 2028 (vs), 1993 (vs); $\nu_{C=S}$ 1017 (s) cm⁻¹. ¹H NMR (CDCl₃): 2.53 (s, 9H, 3CH₃), 3.77(s, 6H, 3CH₂), 7.20−7.40 (m, 3H, C₆H₃) ppm.

Preparation of [(μ-PhCH₂SC=S)Fe₂(CO)₆]₃[1,3,5-(μ-SCH₂)₃C₆H₃] (18). The same procedure was followed as for 17, but PhCH₂Br (0.36 mL, 3.0 mmol) was used instead of MeI to give 18 (0.271 g, 35%) as a red solid, mp 60–62 °C. Anal. Calcd for C₅₁H₃₀Fe₆O₁₈S₉: C, 39.41; H, 1.95. Found: C, 39.68; H, 1.70. IR (KBr disk): $\nu_{\text{C=0}}$ 2066 (s), 2028 (vs), 1993 (vs); $\nu_{\text{C=S}}$ 1016 (s) cm⁻¹. ¹H NMR (CDCl₃): 3.78 (s, 6H, 3SCH₂), 4.26 (s, 6H, 3CH₂Ph), 7.12–7.45 (m, 18H, C₆H₃, 3C₆H₅) ppm.

thermal parameters for non-hydrogen atoms. The calculations were performed using the SHELXTL-97 program. Details of the crystal data, data collections, and structure refinements are summarized in Table 5.

OM050333A

Preparation of [(*µ*-CH₂=CHCH₂SC=S)**Fe**₂(CO)₆]₃[1,3,5-(*µ*-SCH₂)₃C₆H₃] (19). The same procedure was followed as for 17, except that CH₂=CHCH₂Br (0.27 mL, 3.0 mmol) was used instead of MeI. 19 (0.350 g, 50%) was obtained as a red solid, mp 65−67 °C. Anal. Calcd for C₃₉H₂₄Fe₆O₁₈S₉: C, 33.36; H, 1.72. Found: C, 33.72; H, 1.75. IR (KBr disk): ν C=0 2067 (s), 2029 (vs), 1994 (vs); ν C=S 1016 (s) cm⁻¹. ¹H NMR (CDCl₃): 3.70−3.76 (m, 12H, 6SCH₂), 5.16−5.26 (m, 6H, 3CH₂=), 5.60−5.80 (m, 3H, 3CH=), 7.34 (s, 3H, C₆H₃) ppm.

X-ray Structure Determinations of 5, 12, 15, and 17. While single crystals of 12, 15, and 17 suitable for X-ray diffraction analysis were grown by slow evaporation of their CH₂Cl₂/hexane solutions at 4 °C, the X-ray quality crystals of 5 were produced by slow evaporation of its Et₃N/MeOH solution at 4 °C. Each crystal was mounted on a Bruker SMART 1000 automated diffractometer with a graphite monochromator with Mo Kα radiation ($\lambda = 0.71073$ Å). The structures were solved by direct methods and expanded by Fourier techniques. The final refinements were accomplished by the full-matrix least-squares method with anisotropic
