Various 2-(6-substituted 3(Z)-hexen-1,5-diynyl)anilines **1a–g** were treated with potassium *tert*-butoxide or potassium 3-ethylpentanoxide in NMP at 60 °C for 2 h to give the corresponding 5-substituted carbazoles **2a–g** in 36–65% yields together with indoles **9a–g** in 21–40% yields, respectively. Exposing the trifluoroacetamide analogues **10h–k** under the same reaction conditions gave the carbazoles **2b–e** in 37–57% yields and indoles **9b–e** in 15–27% yields. Subsequent cyclizations of acetamide analogues **10a–g** gave carbazoles **2a–g** in 53–86% yields.

Introduction

Carbazoles are a series of natural products which are widely distributed in higher plants. An important part of the carbazole alkaloids and their correlative components is their variety of biological activities,¹ especially the highlight inhibitory activity of protein kinase C and topoisomerase.² Although related works on synthetic and natural isolated carbarzoles were found in abundance,³ considerable attention is still being paid to the carbazole alkaloids because of the growing new active structures and their related studies.⁴ Recently, we described several anionic cycloaromatization reactions of conjugated enediyne systems which provided novel methods to prepare

phenanthridinones,^{5,6} biaryls,^{5,6} and dibenzofurans.⁷ In continuation of the application of anionic cycloaromatization of enediynes, we herein report a new synthesis of the carbazole nucleus **2** by way of intramolecular cyclization of 2-(6-substituted 3(Z)-hexen-1,5-diynyl)aniline **1** under alkaline conditions (eq 1).

Results and Discussion

The synthesis of **1a** is outlined in Scheme 1. Sonogashira coupling reaction⁸ of *cis*-dichloroethene (**3**) with 1-hexyne (**4**) gave vinyl chloride **5**⁹ in 50% yield. Compound **5** was then coupled with trimethylsilylacetylene under the same reaction conditions to give enediyne **6** in 91% yield. Treatment of **6** with potassium carbonate in dry methanol offered a desilylated product **7a** in 79% yield. Finally, enediyne **7a** was coupled with 2-iodoaniline (**8**) using tetrakis(triphenylphosphine)palladium as a catalyst to provide the desired 2-(3(Z)-decen-1,5-diynyl)aniline (**1a**) in 39% yield.¹⁰

Several attempts for the conversion of **1a** to the carbazole nucleus **2a** have been carried out. Initially,

TABLE 1. Probing Conditions for the Cyclization of 1a

conditions	products, yields (%)
Na, MeOH, reflux, 16 h	9a, 40
<i>n</i> -BuLi, THF, 60 °C, 16 h	no desired product
<i>t</i> -BuOK, NMP, 60 °C, 2 h	2a, 58 9a, 21

2-(3(Z)-decen-1,5-diynyl)aniline (**1a**) was treated with sodium methoxide in refluxing methanol for 16 h to give an indole product **9a** in 40% yield; however, no desired carbazole **2a** was obtained (Table 1). Treatment of **1a** with *n*-BuLi in THF at 60 °C yielded neither the carbazole nor indole. However, treatment of compound **1a** with *t*-BuOK in NMP¹¹ at 60 °C for 2 h afforded 5-substituted carbazole **2a** in a yield of 58% together with indole product **9a** in a yield of 21%.

After the successful investigation of the synthesis of 5-substituted carbazoles, we then turned our attention to test the generality of this cyclization reaction. Various 2-(6-substituted 3(Z)-hexen-1,5-diynyl)anilines **1b–g** were prepared by the described method. Treatment of **1b–g** with *t*-BuOK under the same reaction conditions resulted in the formation of carbazoles **2b–g** in yields of 36–60% and indoles **9b–g** in 21–40% yield (Table 2). It was thought that the formation of the indoles could be due to the fast protonation during the cyclization process, and the employment of a more bulky base could reduce the rate of protonation process and would allow us to obtain the higher yield of carbazoles. Thus, potassium 3-ethylpentanoate was introduced to this double cyclization reaction. The results are shown in Table 2. Treatment of **1a–g** with potassium 3-ethylpentanoate in NMP at 60 °C for 2 h formed carbazoles **2a–g** as the major products in 37–65% yields together with indoles **9a–g** as minor products in 20–30% yields. It seems that there is no significant alternation of the product formation by using potassium 3-ethylpentanoate as a base. The indoles are still obtained as the minor product. Despite this, carbazoles were the major products of double cyclization reaction of 2-(6-substituted 3(Z)-hexen-1,5-diynyl)anilines **1a–g**.

To diminish the formation of indoles, we then turned our attention to the cyclization of *N*-acetyl-2-(6-substituted 3(Z)-hexen-1,5-diynyl)anilines **10a–g**. Compounds **10a–g** were prepared by reaction of **1a–g** with acetyl chloride (Table 3), and treatment of **10a–g** with *t*-BuOK in NMP at 60 °C for 2 h gave the carbazoles **2a–g** in 45–86% yields. Only trace amount of indoles were observed using TLC in some cases. The trifluoroacetamide analogues **10h–k** were also prepared (Table 3), and treatment of **10h–k** with *t*-BuOK under the same reaction conditions produced the carbazoles **2b–e** in 37–57% yields and indoles **9b–e** in 15–27% yields, respectively (Table 4). The results are similar to that of cyclization of **1b–e**. This possibly because the trifluoroacetyl group is more labile than the acetyl group under these reaction conditions. We also have the phenylsulfonamide analogue

of **1a**, but cyclization of this derivative gave a very complicated product mixture.

Conclusion

In conclusion, we have examined several reaction conditions for the synthesis of 5-substituted carbazoles by way of intramolecular anionic cyclization of 2-(6-substituted 3(*Z*)-hexen-1,5-diynyl)anilines. Among them, the optimal condition to generate the carbazoles is the cyclization of *N*-acetyl-2-(6-substituted 3(*Z*)-hexen-1,5-diynyl)anilines. The results strongly enhance the synthetic application of anionic cycloaromatization of enediynes.

Experimental Section

General Procedure for the Cyclization of 2-(6-Substituted 3(*Z*)-hexen-1,5-diynyl)anilines or *N*-Acetylanilines (Base A). To a stirred solution of 2-(6-substituted 3(*Z*)-hexen-1,5-diynyl)anilines or *N*-acetylanilines (1 mmol) in 10 mL of NMP was added *t*-BuOK (2.5 mmol), and the solution was heated to 60 °C and stirred for 2 h. After the solution was cooled to room temperature, a saturated aqueous solution of NaCl was added into the reaction mixture and extracted with EtOAc. The combined organic extracts were dried over anhydrous MgSO₄. After filtration and removal of solvent, the residue was purified by column chromatography (silica gel, hexane as eluent) to give the products. **Base B:** The reaction conditions were the same as the above conditions, except *t*-BuOK was replaced with potassium 3-ethylpentanoate.

General Procedure for the Preparation of *N*-Acetyl-2-(6-substituted 3(*Z*)-hexen-1,5-diynyl)anilines and Their Related Derivative from 2-(6-Substituted 3(*Z*)-hexen-1,5-diynyl)anilines (Base A). To a solution of 2-(6-substituted 3(*Z*)-hexen-1,5-diynyl)anilines (1 mmol) in 10 mL of CH₂Cl₂ were added acetyl chloride (1.2 mmol) and triethylamine (1.5 mmol), and the solution was stirred for 4 h. Then, saturated aqueous NaCl solution was added and the mixture extracted with CH₂Cl₂. The combined organic extracts were dried over anhydrous MgSO₄. After filtration and removal of solvent, the residue was purified by column chromatography to give the products. **Base B:** The reaction conditions were the same as above, except the acetyl chloride was replaced by trifluoroacetic anhydride (1.2 mmol).
