Addition of functionalized aryl, heteroaryl or adamantyl zinc reagents to various nitroso-arenes in the presence of magnesium salts and LiCl in THF produces after a reductive work-up with FeCl₂ and NaBH₄ in ethanol the corresponding polyfunctional secondary amines in high yields.

The preparation of arylamines is an important synthetic goal since these compounds often have useful properties for pharmaceuticals or material science applications.¹ Transition metal catalyzed aminations have been well studied,² but the use of expensive and toxic metallic catalysts reduces somewhat the utility of such synthetic methods. Another approach has been the use of electrophilic nitrogen reagents and their reactions with non-expensive and low toxic main-group organometallics.³ A few years ago, we have reported that functionalized arylmagnesium reagents add to nitroso-arenes⁴ and nitro-arenes.⁵ Although satisfactory yields were obtained, the high reactivity of the carbon-magnesium bond reduces the functional group tolerance. Furthermore, nitroso-arenes have proven to be versatile reagents for performing nitroso aldol and related reactions.⁶

Herein, we wish to report a mild synthesis of diaryl or heteroaryl(aryl)amines as well as functionalized highly sterically hindered adamantyl(aryl)amines. Thus, the treatment of an arylzinc derivative **2**, prepared either by the direct insertion of Mg in the presence of LiCl and ZnCl₂⁷ or by a I/Mg-exchange with iPrMgCl·LiCl⁸ followed by transmetalation with ZnCl₂, with various nitroso-arenes of type **3**⁹ affords an intermediate zinced hydroxylamine derivative **4** which after reductive work-up with

| 14 |  |  |  | 83 |
| 15 |  |  |  | 70 |

^a General reaction conditions: arylzinc reagent (1.1 equiv), nitroso electrophile (1.0 equiv), NaBH₄ (1.0 equiv), FeCl₂ (2.0 equiv). ^b Yield of analytically pure isolated product as determined by ¹H-NMR analysis. ^c The TMS-group was cleaved during the workup and column chromatography purification. ^d Prepared by I/Mg-exchange with iPrMgCl-LiCl.⁸

FeCl₂ and NaBH₄ in ethanol (25 °C, 15 h) produce the corresponding secondary amines of type **5** in excellent yields (Scheme 1). A range of functional groups have been tolerated in the starting arylzinc reagent as shown in Table 1.

Thus, PhZnCl (1.1 equiv) prepared by the direct insertion of Mg in the presence of LiCl and ZnCl₂ reacts with nitrosobenzene **3a** (1.0 equiv) at 25 °C within 2-3 h and produces after reductive work-up with FeCl₂ (2.0 equiv) and NaBH₄ (1.0 equiv) in ethanol (25 °C, 15 h) the corresponding diphenylamine **5a** in 85% yield (Table 1, entry 1).^{10a} The presence of both Mg salts and LiCl were found to be essential for achieving a high yield. A variety of arylzinc reagents prepared similarly were used in the addition to **3a**. Both electron withdrawing and donating groups can be attached at the aryl ring (Table 1, entries 2-8).^{10b-g} Arylzinc reagent **2c** has been prepared via an I/Mg-exchange,⁸ its reaction with nitrosobenzene (**3a**) furnishes the corresponding secondary amine **5c** in 76% yield (Table 1, entry 3). Although sensitive functional groups like a formyl or an acetyl group are not tolerated, the corresponding bromoacetal (**1i**) or bromoketal (**1j**) are readily converted to the zinc reagents (**2i** and **2j**) by the insertion of Mg in the presence of LiCl and ZnCl₂.⁷ The addition of nitrosobenzene (**3a**) provides after removal of the ethylene glycol protecting group (CF₃CO₂H in CH₂Cl₂ at 25 °C for 5-8 h) the secondary amines (**5i** and **5j**) in 64-75% yield (Table 1, entries 9 and 10).

Table 3 Synthesis of tertiaryalkyl(aryl)amines **7a-d** by the addition of tertiary alkylzinc reagents **6a** and **6b** to nitroso compounds **3a**, **3f** and **3h**

| Entry | Zn-reagent | Electrophile | Product, Yield (%) ^{a,b} |
|-------|--|---|---|
| 1 |  |  |  |
| 2 |  |  |  |
| 3 |  |  |  |
| 4 |  |  |  |

^a General reaction conditions: alkylzinc reagent (1.1 equiv), nitroso electrophile (1.0 equiv), NaBH₄ (1.0 equiv), FeCl₂ (2.0 equiv). ^b Yield of analytically pure isolated product as determined by ¹H-NMR analysis. ^c Prepared by transmetalation of commercially available *t*-BuMgCl with ZnCl₂.

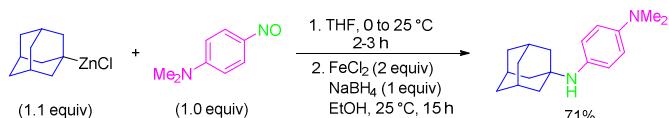

This addition reaction can be extended to various nitroso-arenes (commercially available) or prepared according to the method of Bäckvall.¹¹ Again, electron-donating or accepting substituents are tolerated in the arylnitro reagents of type **3** furnishing the corresponding diarylamines **5k-r** in 77–97% yield (Table 2, entries 1–8).^{5a,10h-k} Noteworthy, a heterocyclic zinc reagent (**2k**) has also been used as well as a nitrosopyridine (**3g**)¹² leading to heteroaryl(aryl)-amines **5s-y** in 55–96% yield (Table 2, entries 9–15). Moreover, tertiary alkylzinc reagents such as *t*-BuZnCl (**6a**) and adamantlyzinc chloride (**6b**)¹³ add to various nitroso-arenes under similar reaction conditions producing otherwise difficult to prepare tertiaryalkyl(aryl)amines **7a-d** in 50–89% yield (Table 3, entries 1–4).¹⁴

In summary, we have shown that aryl, heteroaryl or adamantly zinc reagents add to various nitroso-arenes in the presence of Mg-salts and LiCl. Both Mg and Li salts are necessary to achieve high yields for the synthesis of the corresponding functionalized secondary amines. Further extensions of this work are currently underway in our laboratories.

The research leading to these results has received funding from the European Research Council under the European Community's Seventh Framework Programme (FP7/2007–2014) ERC grant agreement no. 227763. We thank the Fonds der Chemischen Industrie for financial support. We also thank Heraeus Holding GmbH (Hanau), Rockwood Lithium (Frankfurt), and BASF SE (Ludwigshafen) for the generous gift of chemicals.
