4H-Imidazolin-4-ones are important heterocycles having biological and pharmaceutical activities,¹⁻⁶ and some 2-alkylthioimidazolinones show significant fungicidal activities.⁷⁻⁹ However, most of the 2-alkylthioimidazolinones reported are of the 5,5-disubstituted type and were generally synthesized from corresponding α -aminoacetic acid^{9,10} (*Eq. 1*). Unfortunately, 5-benzylidene-2-alkylthioimidazolinones cannot be prepared by this general method for the

corresponding starting material would be unstable vinyl amino acetic acids. Recently, we became interested in the synthesis of biologically active imidazolinones *via* tandem aza-Wittig reaction¹¹⁻¹³ and now report a new efficient preparation of 5-benzylidene-2-alkylthioimidazolinones from the stable vinyliminophosphorane **1**.

The easily accessible vinyliminophosphorane **1**¹⁴ reacted with carbon disulfide to give vinyl isothiocyanate **2**. While the reaction of **2** with aliphatic primary amines took place smoothly at room temperature to give 2-thioxo-4-imidazolidinones **3** in 65-95% yields, aromatic primary amines required reflux in acetonitrile in the presence of potassium carbonate (*Eq. 2*).

The results are listed in *Table 1*. Some of 2-thioxo-4-imidazolidinones **3** were also compared with authentic samples prepared previously by condensation of 2-thiohydantoin with aromatic aldehyde,¹⁵ or by reaction of 4-benzylidene-2-benzylthio-2-thiazolin-5-ones with various primary aromatic amines in the presence of sodium acetate in acetic acid.¹⁶

S-Alkylation of **3d** with alkyl halides in the presence of potassium carbonate provided 2-alkylthio-5-benzylidene-4H-imidazolin-4-ones **4** in 63-87% yields. While activated alkylating agents (RI, BrCH₂COR) reacted at room temperature, the other alkylating reagents required heating at 50~60°C (*Table 2*).

EXPERIMENTAL SECTION

Melting points are uncorrected. MS were measured on a HP5988A spectrometer. IR were recorded on a PE-983 infrared spectrometer as KBr pellets with absorption in cm⁻¹. NMR were recorded in CDCl₃ on a Varian XL-200 spectrometer and resonances are given in ppm (δ) relative to TMS. Elemental analyses were taken on a Perkin-Elmer 2400 CHN Elemental Analysis Instrument. CS₂ is poisonous and an efficient hood should be used.

Preparation of 3-Alkyl-2-thioxo-4-imidazolidinones (3a-e). General Procedure.- To a solution of vinyliminophosphorane **1¹⁴** (2.25 g, 5 mmol) in dry methylene chloride (15 mL) was added excess carbon disulfide (5 mL). After the reaction mixture was refluxed for 28 hours, the solvent was removed under reduced pressure and ether/petroleum ether (1:2, 20 mL) was added to precipitate triphenylphosphine sulfide which was removed by filtration. The filtrate was evaporated to give isothiocyanate **2**, which was used directly without further purification. To a solution of the crude **2** in CH₃CN (15 mL) was added RNH₂ (5 mmol) and the mixture was allowed to stand for 10~50 min at room temperature. The precipitated solid was collected and washed with water and ethanol, crystallized from methylene chloride/petroleum ether to give 3-alkyl-2-thioxo-4-imidazolidinone **3a-e**.
