ABSTRACT

An asymmetric Friedel–Crafts alkylation reaction of 2-furyl ketones with β -trifluoromethyl enones has been developed via formal trienamine catalysis of a bifunctional primary amine-thiourea substance derived from *L*-*tert*-leucine, delivering the furan derivatives incorporating a stereogenic trifluoromethyl (CF_3) group in good to high yields with excellent enantioselectivity.

The enantioselective introduction of a trifluoromethyl group into organic molecules has attracted great attention in material and medicinal chemistry, because of the unique properties of the perfluoroalkyl group.¹ In particular, asymmetric catalysis

1
2 starting from prochiral trifluoromethylated substrates seems to be a convenient and
3 efficient strategy for the construction of the target compounds with a CF₃ stereogenic
4 center, and fruitful results have been achieved.² On the other hand, asymmetric
5 Friedel–Crafts alkylation of electron-rich arenes or heteroarenes with unsaturated
6 substances provides a straightforward protocol to access compounds with a benzylic
7 stereogenic center.³ As a powerful and atom-economical method for the construction
8 of chiral building blocks, previous strategy mainly relies on the LUMO activation of
9 the electrophilic partners.⁴ In contrast, an alternative activation mode, increasing the
10 nucleophilicity of the aromatic compounds by raising the HOMO energy, has rarely
11 been explored. Since the HOMO activation of carbonyl compounds via the in situ
12 formation of enamine species has been well developed,⁵ recently chemists further
13 found that the energy transfer to aromatic systems could be effectively achieved by
14 generating the conjugated enamine intermediates with arene substances.⁶ Based on
15 such an inspiration, our group first reported the remote enantioselective
16 Friedel–Crafts alkylations of 2-furfuryl ketones with alkylidenemalononitriles by
17 forming the formal trienamine intermediates,⁷ giving the desired chiral products with
18 excellent regio- and enantioselectivity.^{8,9} Nevertheless, it was found that the limited
19 substrate scope was observed, as the other tested activated alkenes generally suffered
20 from low reactivity or poor enantioselectivity. While many natural products
21 possessing the furan units with chiral benzylic centers exhibit antimalarial, antifeedant
22 or other bioactivities,¹⁰ it would be desirable to expand our newly developed catalytic
23 method, by incorporating the stereogenic trifluoromethyl group to furan derivatives
24 from the highly electrophilic β-CF₃ substituted enones and 2-furfuryl ketones.

The enantioselective Friedel–Crafts alkylation was first investigated with readily available *(E*)-1,1,1-trifluoro-4-phenylbut-3-en-2-one (**1a**) and 1-(furan-2-yl)propan-2-one (**2a**) under the catalysis of 9-amino-9-deoxyepiquinidine (**C1**) and benzoic acid (**A1**) in toluene at 60 °C (Table 1, entry 1).¹¹ To our delight, the desired product **3a** was obtained in 40% yield, while the enantioselectivity was poor (Table 1, entry 1). Bifunctional primary amine catalysts **C2–C4** significantly improved the ee values (entries 2–4), indicating that the H-bonding donor was crucial for the stereocontrol, in a concerted activation pattern as previously observed.⁸ Interestingly, the *L*-proline derived secondary amine **C5**, which is usually employed for the activation of aldehydes or cyclic ketones,¹² also provided the product with good enantioselectivity (entry 5). Lowering down the temperature enhanced the enantioselectivity to 91%, while a longer reaction time was needed for a better conversion (entry 6). Subsequently, the solvent effects were evaluated. 1,2-Dichloroethane (DCE), dioxane and trifluoromethylbenzene (PhCF₃) only gave moderate results (entries 7–9), while mesitylene provide the best ee value with a moderate yield (entry 10). Thus, toluene was chosen with a compromise between reactivity and enantioselectivity. The acid additives were screened as well, and **A4** with a bulky substituent at *meta*-position afforded a better yield than those of others (entries 11–13). Pleasingly, a new primary amine-thiourea catalyst derived from *L*-*tert*-leucine (**C6**) greatly improved the reactivity of the reaction, affording an almost quantitative yield in 12 h with excellent enantioselectivity (entry 14). The acid additive also played an important role in the reaction, as higher loadings resulted in decreased reactivity and enantioselectivity (entry 15), while no product was formed in the absence of the acid (entry 16).

^aUnless noted otherwise, reactions were conducted with **1a** (0.1 mmol), **2a** (0.15 mmol), catalyst **C** (0.02 mmol), acid **A** (0.02 mmol) in solvent at 60 °C for 36 h. ^bIsolated yield.

^cDetermined by chiral HPLC analysis using a chiral stationary phase. ^dAt rt for 96 h. ^eAt rt for 12 h. ^fWith 0.04 mmol acid. ^gWithout acid.

With the optimized conditions in hand, the substrate scope was examined as shown in Table 2. At first, a variety of β -trifluoromethyl enones,¹³ with a different aryl substituent at the α' -position, were applied to the Friedel–Crafts alkylations with **2a**. The substrates with an electron-deficient aryl group seemed to be more reactive than those with an electron-rich one, and all of them, as well as the one with a 2-naphthyl group, afforded the corresponding products **3b–i** in excellent yields and enantioselectivity (entries 2–9). The enones with a heteroaryl group also provided the desired products with good to excellent ee values (entries 10–12). The one possessing a styrene group showed lower reactivity, but still with high enantiocontrol (entry 13). Nevertheless, enones with an α' -alkyl group or the unsaturated ester analogues failed to participate in the reaction due to the lower electrophilicity.¹⁴ On the other hand, a few 2-furfuryl ketones were tested with **1a**. The ketones with a larger group, such as ethyl, or an even longer liner alkyl chain, showed decreased reactivity but with comparable enantioselectivity (entries 14–16). Other α' -substituted ketones bearing a functional group, including a benzyl or ether moiety were also compatible for the transformation, generating **3q** and **3r** in good results (entries 17 and 18).

^aUnless noted otherwise, reactions were conducted with **1** (0.1 mmol), **2** (0.15 mmol), catalyst **C6** (0.02 mmol), **A4** (0.02 mmol) in toluene at rt. ^bIsolated yield. ^cDetermined by chiral HPLC analysis using a chiral stationary phase. ^dAt 0 °C. ^eThe absolute configuration of **3m** was determined by X-ray analysis.¹⁴ The other products were assigned by analogy.

To further expand the substrate scope, a cyclic *N*-sulfonyl ketimine **4** was also employed as the electrophile for the Mannich-type Friedel–Crafts alkylation with **2a**.

In this case, the combination of a bifunctional catalyst **C7** and acid **A5** showed better catalytic efficacy after extensive screenings, while the product **5** was obtained with a fair yield with moderate enantioselectivity (Scheme 1).

Scheme 1. Asymmetric Friedel–Crafts Reactions of 2a with Cyclic N-Sulfonyl Ketimine 4

In conclusion, we have developed an efficient and enantioselective Friedel–Crafts alkylation reaction between β -trifluoromethyl enones and 2-furyl ketones in the presence of a bifunctional primary amine-thiourea via HOMO activation strategy. A variety of highly enantioenriched furan derivatives containing a trifluoromethyl stereogenic center were produced in good to excellent yields. Such an activation strategy for aromatic systems might be further applied in organic synthesis in the future.

EXPERIMENTAL SECTION

General Procedures. NMR data were obtained for ^1H NMR at 400 MHz or 600 MHz and for ^{13}C NMR at 100 MHz or 150 MHz. Chemical shifts were reported in ppm from tetramethylsilane with the solvent resonance as the internal standard in CDCl_3 solution. Mass spectra were recorded using ESI as the method of ionization. ESI-HRMS spectra were measured with a QTOF instrument. In each case,

enantiomeric ratio was determined by HPLC analysis on a chiral stationary phase in comparison with authentic racemate, UV detection was monitored at 220 or 254 nm. Optical rotation data were examined at 589 nm in CHCl₃ solution at 20 °C. Column chromatography was performed on silica gel (200-300 mesh) eluting with ethyl acetate and petroleum ether. TLC was performed on glass-backed silica plates. UV light and I₂ were used to visualize products. All chemicals were used without purification as commercially available unless otherwise noted.

β -Trifluoromethyl enones **1**,¹⁵ 2-furfuryl ketones **2**,⁶ and imine **4**¹⁶ were prepared according to the literature procedures.

Procedure for the Synthesis of

(S)-1-(2-amino-3,3-dimethylbutyl)-3-(3,5-bis(trifluoromethyl)phenyl)thiourea (C6).

To a solution of (*S*)-2-amino-3,3-dimethylbutan-1-ol¹⁷ (4.5 g, 43.7 mmol) and triethylamine (18 mL, 130.1 mmol) in CH₂Cl₂ (50 mL) was added (Boc)₂O (10.5 g, 48.1 mmol) at 0 °C. The mixture was stirred at room temperature until the consumption of (*S*)-2-amino-3,3-dimethylbutan-1-ol (monitored by TLC analysis).

Then the mixture was concentrated in vacuo and purified through flash chromatography on silica gel. According to the reported procedure,¹⁸ the *tert*-butyl (*S*)-(1-amino-3,3-dimethylbutan-2-yl)carbamate was obtained.

Isothiocyanato-3,5-bis(trifluoromethyl)benzene (2.70 g, 10.0 mmol) was added to a stirred solution of the chiral amine (2.2 g, 10.2 mmol) in CH₂Cl₂ (25 mL) for 30 min at 0 °C and for 2 h at room temperature. The solvent was removed and the residue was dissolved in CF₃COOH: CH₂Cl₂ = 1:1 (5 mL: 5 mL), and the mixture was stirred until

the reaction was completed (monitored by TLC analysis). The mixture was diluted with CH₂Cl₂ (20 mL) and adjusted pH to 8 with saturated sodium bicarbonate solution. The organic phase was separated. The aqueous phase was extracted with CH₂Cl₂ (20 mL) and the combined organic layers were washed with brine, dried over anhydrous Na₂SO₄, filtered, and concentrated in vacuo. Purification by flash chromatography on silica gel (CH₂Cl₂: MeOH = 30:1) gave product **C6** in 57% yield (for two steps), 2.2g, light yellow solid, mp 52–55 °C, $[\alpha]_D^{20} = -14.3$ (*c* = 10.45 in CHCl₃), ¹H NMR (400 MHz, CD₃OD) δ 8.22 (s, 2H), 7.60 (s, 1H), 3.99 (bs, 1H), 3.33–3.27 (m, 1H), 2.74, 2.72 (d, *J* = 7.2 Hz, 1H), 0.97 (s, 9H) ppm; ¹³C NMR (100 MHz, CD₃OD) δ 185.2, 145.5, 134.8 (q, *J*_(C-F) = 33.3 Hz), 126.9 (q, *J*_(C-F) = 270.4 Hz), 125.9, 119.9, 63.3, 49.9, 37.0, 28.8 ppm; IR (CH₂Cl₂) ν 3262, 2964, 2873, 1602, 1538, 1472, 1275, 1229, 1173, 1131 (cm⁻¹); ESI HRMS: calcd. For [C₁₅H₁₉F₆N₃S + H⁺] 388.1277, found 388.1275.

General procedure for asymmetric Friedel–Crafts Alkylation. The reaction was carried out with trifluoromethyl-containing electrophile **1** or **4** (0.1 mmol) and 2-furyl ketone **2** (0.15 mmol) in toluene (1.0 mL) in the presence of primary amine catalyst **C6** (7.74 mg, 0.02 mmol), 3,5-di-*tert*-butylenzoic acid **A4** (4.68 mg, 0.02 mmol) at room temperature or 0 °C for 12 h to 96 h. After completion, the solution was concentrated and the residue was purified by flash chromatography on silica gel (petroleum ether: ethyl acetate = 30:1 to 10:1) to afford the chiral product **3** or **4**.

The racemic products were prepared following the general procedure, using a racemic 1-(2-amino-1,2-diphenylethyl)-3-(4-fluorophenyl)thiourea compound as the catalyst.

(*S*)-4,4,4-Trifluoro-3-(5-(2-oxopropyl)furan-2-yl)-1-phenylbutan-1-one (**3a**). $R_f = 0.31$ (petroleum ether: ethyl acetate = 10: 1), 99% yield, 16.0 mg, light yellow oil, $[\alpha]_D^{20} = -20.2$ ($c = 4.65$ in CHCl_3), 91% ee, determined by HPLC analysis (Daicel Chiralpak OD, *n*-hexane/*i*-PrOH = 95/5, 1 mL/min, UV 220 nm, $t_{\text{major}} = 10.92$ min, $t_{\text{minor}} = 15.51$ min); ^1H NMR (600 MHz, CDCl_3) δ 7.95 (d, $J = 7.2$ Hz, 2H), 7.60 (t, $J = 7.8$ Hz, 1H), 7.48 (t, $J = 7.8$ Hz, 2H), 6.30 (d, $J = 3.0$ Hz, 1H), 6.15 (d, $J = 3.0$ Hz, 1H), 4.39-4.36 (m, 1H), 3.74 (dd, $J = 17.4$ Hz, $J = 9.6$ Hz, 1H), 3.63 (s, 2H), 3.45 (dd, $J = 18.0$ Hz, $J = 4.2$ Hz, 1H), 2.06 (s, 3H) ppm; ^{13}C NMR (151 MHz, CDCl_3) δ 203.9, 194.9, 148.6, 147.1, 136.1, 133.7, 128.8, 128.1, 125.6 (q, $J_{(\text{C}-\text{F})} = 278.2$ Hz), 110.5, 119.4, 43.2, 39.1 (q, $J_{(\text{C}-\text{F})} = 28.9$ Hz), 35.8, 28.9 ppm; IR (CH_2Cl_2) ν 2920, 2850, 1716, 1691, 1597, 1463, 1106, 1154, 1262 (cm^{-1}); ESI HRMS: calcd. For $[\text{C}_{17}\text{H}_{15}\text{F}_3\text{O}_3 + \text{Na}^+]$ 347.0866, found 347.0872.

(*S*)-4,4,4-Trifluoro-3-(5-(2-oxopropyl)furan-2-yl)-1-(*o*-tolyl)butan-1-one (**3b**). $R_f = 0.35$ (petroleum ether: ethyl acetate = 8:1), 96% yield, 32.4 mg, light yellow oil, $[\alpha]_D^{20} = -7.2$ ($c = 6.55$ in CHCl_3), 93% ee, determined by HPLC analysis (Daicel Chiralpak OD, *n*-hexane/*i*-PrOH = 95/5, 1 mL/min, UV 220 nm, $t_{\text{major}} = 9.30$ min, $t_{\text{minor}} = 11.03$ min); ^1H NMR (400 MHz, CDCl_3) δ 7.65 (d, $J = 8.0$ Hz, 1H), 7.40 (t, $J = 7.6$ Hz, 1H), 7.31-7.24 (m, 2H), 6.30 (d, $J = 2.8$ Hz, 1H), 6.16 (d, $J = 2.8$ Hz, 1H), 4.36-4.30 (m, 1H), 3.66-3.59 (m, 3H), 3.40 (dd, $J = 17.6$ Hz, $J = 4.0$ Hz, 1H), 2.41 (s, 3H), 2.09 (s, 3H) ppm; ^{13}C NMR (100 MHz, CDCl_3) δ 203.9, 198.6, 148.6, 147.2, 138.6, 136.8, 132.1, 131.9, 128.4, 125.9, 125.6 (q, $J_{(\text{C}-\text{F})} = 278.2$ Hz), 110.5, 109.4, 43.2, 39.3 (q, $J_{(\text{C}-\text{F})} = 29.2$ Hz), 38.5, 29.0, 21.2 ppm; IR (CH_2Cl_2) ν 2923, 2853,
