S Supporting Information

ABSTRACT: Phosphatidyl inositol mannosides (PIMs) are constituents of the mycobacterial cell wall; these glycolipids are known to exhibit potent inhibitory activity toward the LPS-induced production of cytokines by macrophages, and therefore have potential as anti-inflammatory agents. Recently, heterocyclic analogues of PIMs in which the inositol is replaced by a piperidine (aza-PIM mimics) or a tetrahydropyran moiety (oxa-PIM mimics) have been prepared by short synthetic sequences and shown to retain the biological activity of the parent PIM structures. In this investigation, the aza-PIM analogue was used as a convenient scaffold to link biotin or a fluorescent label (tetramethyl-rhodamine) by way of an aminocaproyl spacer, with the goal of using these conjugates for intracellular localization and for the study of the mechanism of their antiinflammatory action. The synthesis of these compounds is reported, as well as the evaluation of their activities as inhibitors of LPS-induced cytokine production by macrophages (TNF α , IL12p40); preliminary investigations by FACS and confocal microscopy indicated that PIM–biotin conjugate binds to macrophage membranes with rapid kinetics.

INTRODUCTION

Mycobacteria express a number of molecules modulating the host immune system. Among them, mannose-capped lipoarabinomannan (ManLAM), lipomannans (LM), and PIM are recognized by various pattern recognition receptors present on macrophages and dendritic cells such as Toll-like receptors (TLRs)^{1–5} or C-type lectins like mannose receptor (CD206) and DC-SIGN (CD209).^{6–9} Several molecules of mycobacterial origin down-modulate the immune system, including the ESAT-6 and ManLAM, but also diacylated forms of LM and their glycosyl-phosphatidylinositol (GPI) anchor structure phosphatidyl-*myo*-inositol mannosides (PIM).^{10–12} Dimannoside and hexamannoside PIM (PIM₂ and PIM₆), the two most abundant classes of PIM found in *M. tuberculosis* H37Rv and *M. bovis* BCG, inhibit endotoxin-induced proinflammatory responses, and we could reproduce this activity with synthetic PIM₁ and a mimetic of PIM₂.¹² We showed that the inhibition of TNF α and IL-12p40 expression in response to TLR2 or TLR4 agonists by synthetic PIM₁ and PIM₂ mimetic could be partially explained by an inhibition of LPS binding to CD14 in murine macrophages.¹³ However, some inhibitory activities of PIM₁ and PIM₂ mimetic were independent of CD14, as seen for the inhibition of IL-12p40 release in response to rough-LPS stimulation of TLR4 pathway independent of CD14.¹³ The mechanisms involved in PIM biological actions are thus likely

to be complex, not clearly understood, and may involve both receptor recognition and direct interaction with the cell membranes. There is a clear need to perform experiments with labeled derivatives, for in-cell imaging and localization studies.

The synthesis of PIM₁ or PIM₂ derivatives carrying appropriate substituents for labeling would require the differentiation of the OH groups of the inositol moiety. Although efficient methodologies are available for selective protection of the OH groups in *myo*-inositol,^{14–16} the synthesis of such compounds would require long sequences of reactions. This difficulty could be avoided by taking advantage of our PIM mimics based on an aza-cyclitol core. We have recently shown¹⁷ that the inositol moiety in PIM₂ could be advantageously replaced by a saturated heterocyclic unit, such as a piperidine (as in **IA**, Figure 1) or a tetrahydropyran (as in **IB**): these compounds retain the biological activity of the parent PIM structures, provided the nitrogen group in **IA** is acylated. The aza-cyclitol moiety present in **IA** and related compounds provides thus a point of attachment readily available for tethering groups which can be used to conjugate PIM mimics

Figure 1. PIM₂ mimics built on an heterocyclic core.¹³

with various markers or carriers. We report in this article the synthesis of aza-PIM mimics carrying biotin or a fluorescent label, as well as initial biological investigations of the immunomodulating activity of the new compounds and of their utility as imaging probes.

EXPERIMENTAL PROCEDURES

Synthesis—General Procedures. Unless otherwise stated, all reactions requiring anhydrous conditions were carried out under dry Ar. Dichloromethane (CH₂Cl₂) was distilled from calcium hydride (CaH₂). Diethyl ether (Et₂O) was distilled from CaH₂ and stored at 4 °C, over 4 Å molecular sieves, under Ar. All reagent-grade chemicals were obtained from commercial suppliers (Sigma-Aldrich, Acros) and were used as received. ¹H, ¹³C, ¹⁹F, and ³¹P NMR spectra were recorded on a Bruker DPX250 or a Bruker Avance 400 spectrometer at 25 °C. Proton chemical shifts (δ) are reported in parts per million (ppm) relative to Me₄Si (δ 0.000 ppm) as internal standard. Carbon chemical shifts are referenced to the central line of the CDCl₃ triplet (δ 77.16 ppm), unless otherwise stated. ³¹P and ¹⁹F chemical shifts are reported in ppm downfield from the external standard, phosphoric acid and boron trifluoride diethyl etherate, respectively. Coupling constants (*J*) are reported in hertz (Hz). Spectral splitting patterns are designated as follows: s, singlet; d, doublet; t, triplet; q, quadruplet; m, multiplet; br, broad. Carbon multiplicities were assigned by DEPT experiments. ¹H and ¹³C NMR signals were assigned with the help of H–H and H–C correlations (COSY and HSQC spectra). Flash chromatography was performed according to the established protocol on silica gel 60 (40–63 μm). The purification of final compounds was performed on Sephadex LH-20 from Sigma. Reactions were monitored by thin layer chromatography (TLC) (silica gel 60F₂₅₄ precoated aluminum plates) and the compounds were detected under UV light and by staining with phosphomolybdic acid solution. Electron spray-ionization mass spectrometry (ESI-MS) was performed with a Perkin-Elmer SCIEX API 300 spectrometer. High-resolution mass spectra were recorded on a Bruker maXis UHR-Q-TOF spectrometer in Orléans.

N-Benzyl-3-O-benzyl-1,5-dideoxy-1,5-iminoxylitol (5). This was obtained from diacetone glucose as described recently;¹⁸ purification of **5** by silica gel column chromatography using petroleum ether/ethyl acetate 2/1 as the eluent was required for efficient selective *N*-debenzylation in the next step. (Yield ~31% over 4 steps, from 3-O-benzyl-1,2;5,6-diisopropylidene-α-D-glucofuranose).

3-O-Benzyl-1,5-dideoxy-1,5-iminoxylitol (6). The procedure was improved from the one previously published.¹⁷ Compound **5** previously purified (582 mg, 1.85 mmol) was dissolved in EtOH (15 mL). Palladium hydroxide (Pd(OH)₂)

(80 mg) was added and the reaction mixture was stirred at rt under H₂ atmosphere for 18 h. The catalyst was removed by filtration through a Millipore membrane and washed with EtOH (2 × 10 mL). The organic phases were combined and the solvent was evaporated under reduced pressure to give essentially pure compound **6** (413 mg, 100%) as a white solid. ¹H NMR (400 MHz, CD₃OD): δ 2.90 (dd, 2H, H1A/5A, *J* = 12.8, 6.9 Hz), 3.24 (dd, 2H, H5B/1B, *J* = 12.8, 3.5 Hz), 3.47 (t, 1H, H3, *J*_{3,4} = *J*_{3,2} = 6.2 Hz), 3.87 (ddd, 2H, H2/4), 4.78 (s, 2H, CH₂Ph), 7.22–7.46 (m, 5H, Ph). ¹³C NMR (101 MHz, CD₃OD): δ 48.68 (C1/5), 68.38 (C2/4), 74.65 (CH₂Ph), 81.04 (C3), 128.70, 128.98, 129.30 (CHAr), 139.70 (CqAr). MS: calcd for C₁₂H₁₆NO₃: 223.12; (+)IS-MS: *m/z* 224.5 [M + H]⁺, 246.5 [M + Na]⁺.

N-(6-Trifluoroacetamidohexanoyl)-3-O-benzyl-1,5-dideoxy-1,5-iminoxylitol (7). To a solution of compound **6** (413 mg, 1.85 mmol) in dry CH₂Cl₂ (10 mL), 6-trifluoroacetamidohexanoic acid (462 mg, 2.03 mmol, 1.1 equiv) and 1-hydroxybenzotriazole (HOBt) (300 mg, 2.22 mmol, 1.2 equiv) were added. The mixture was cooled down to 0 °C and dicyclohexylcarbodiimide (DCC) (458 mg, 2.22 mmol, 1.2 equiv) was added. After having been stirred at rt for 18 h, the reaction mixture was diluted with CH₂Cl₂ (50 mL). The organic phase was washed with 1 N aqueous HCl (20 mL), then with brine (20 mL), dried over MgSO₄, and evaporated under vacuum. The residue was purified by silica gel column chromatography (CH₂Cl₂/acetone 3/1, *R*_f = 0.65) to give compound **7** (480 mg, 60%). ¹H NMR (400 MHz, CDCl₃; slow amide bond rotation promotes differentiation of 1/5 and 2/4 positions in the iminoxylitol ring): δ 1.25–1.39 (m, 2H, 2Hc), 1.50–1.68 (m, 4H, 2Hb, 2Hd), 2.30–2.48 (2 td, *J*_{AB} = 15 Hz, 2H, 2Ha), 3.31 (app q, 2H, 2He, *J* = 6.6 Hz), 3.36 (dd, 1H, H1A, *J*_{1A,2} = 1.5, *J*_{1A,1B} = 13.6 Hz), 3.51–3.67 (m, 3H, H5A, H5B, H3), 3.78 (br, 1H, H4), 3.89 (br, 1H, H2), 4.15 (dd, 1H, H1B, *J*_{1B,2} = 4 Hz), 3.34 (br d, 1H, 4-OH, *J* = 7.2 Hz), 4.58 (br s, 1H, 2-OH), 4.66 (AB, 2H, CH₂Ph, *J* = 11.6 Hz), 7.26–7.37 (m, 5H, CHAr), 7.53 (t, 1H, NH, *J* = 4.8 Hz). ¹³C NMR (101 MHz, CDCl₃): δ 24.32 (Cb), 26.15 (Cc), 28.32 (Cd), 32.69 (Ca), 39.56 (Ce), 44.25 (C1), 48.47 (C5), 68.24 (C2, C4), 72.78 (CH₂Ph), 76.98 (C3), 116.04 (q, CF₃, *J* = 289 Hz), 127.66, 128.01, 128.57 (CHAr), 137.96 (CqAr), 157.51 (q, COCF₃, *J* = 37 Hz), 173.90 (CO). ¹⁹F NMR (376 MHz, CDCl₃): δ - 75.74. HRMS (ESI): [M + H]⁺ calcd for C₂₀H₂₈F₃N₂O₅: *m/z* = 433.19448; found *m/z* = 433.19491. [M + Na]⁺ calcd for C₂₀H₂₇F₃N₂NaO₅: *m/z* = 455.17643; found *m/z* = 455.17693.

N-(6-Trifluoroacetamidohexanoyl)-3-O-benzyl-2,4-bis-O-(2,3,4,6-tetra-O-methoxyacetyl-α-D-manno-pyranosyl)-1,5-dideoxy-1,5-iminoxylitol (9). Compound **7** (481

mg, 1.11 mmol) was previously dried overnight under high vacuum and then dissolved under Ar in CH_2Cl_2 (10 mL). 4 Å Molecular sieves were added and the mixture was stirred for 30 min; a solution of 2,3,4,6-tetra-*O*-methoxyacetyl- α -D-mannopyranosyl trichloroacetimidate (**8**)¹⁷ (2.081 g, 3.38 mmol, 3 equiv) in CH_2Cl_2 (5 mL) was added under argon flux. After having stirred the mixture for 15 min, trimethylsilyl triflate (TMSOTf) (266 μL , 1.35 mmol, 40% mol equiv vs the donor) was added and the mixture was stirred for 1 h at rt under Ar. The reaction was stopped by the addition of triethylamine (376 μL , 2 equiv vs TMSOTf), and the mixture was filtered through a sintered glass filter containing Celite. The solvent was removed under vacuum and the residue was purified by silica gel column chromatography (toluene/acetone 2.5/1 to 1/1, difficult separation) to give a pure fraction of compound **9** (553 mg, 37%) as a colorless syrup. ¹H NMR (400 MHz, CDCl_3 ; presence of amide rotamers and of nonequivalent mannosyl residues): δ 1.32–1.45 (m, 2H, 2Hc), 1.52–1.75 (m, 4H, 2Hd, 2Hb), 2.25–2.45 (m, 2H, 2Ha), 2.98 (dd, 0.5 H, J = 9.4, 13.0 Hz), 3.07 (dd, 0.5 H, J = 8.8, 12.8 Hz), 3.13 (dd, 0.5 H, J = 9.2, 13.2 Hz), 3.27 (dd, 0.5H, J = 9.0, 13.8 Hz) (4 dd for H1A and H5A), 3.31–3.53 (m, 26H, 8 \times CH_3 , 2He), 3.55–3.76 (m, 3H, H2, H3, H4), 3.77–4.21 (21H, 8 \times CH_2 , 2H5', 2H6', 2 \times 0.5 H1B/SB), 4.21–4.29 (m, 1H, H6'), 4.30–4.35 (m, 0.5H, 0.5 H1B/SB), 4.36–4.46 (m, 1H, H6'), 4.47–4.54 (m, 0.5H, 0.5 H1B/SB), 4.73–4.88 (m, 2H, CH_2Ph), 5.01 (s, 0.5H, H1'), 5.06 (s, 0.5H, H1'), 5.11 (s, 0.5H, H1'), 5.15 (s, 0.5H, H1'), 5.21–5.52 (m, 6H, 2H2', 2H3', 2H4'), 7.11–7.21 (m, 0.7H, NH), 7.23–7.44 (m, 5H, 5CHar). ¹³C NMR (62.9 MHz, CDCl_3): δ 23.91 and 23.98 (Cb), 26.03 and 26.16 (Cc), 28.33 (Cd), 32.39 and 32.49 (Ca), 39.44 (Ce), 41.23, 44.19, 45.63, 47.97 (C1 and C5, 4 signals), 59.34 (CH_3 MAc), 59.42 (CH_3 MAc), 59.46 (CH_3 MAc), 61.78 and 61.88 (C6'), 62.38 and 62.55 (C6'), 65.50, 65.69, 66.05, 66.71, 68.35, 68.60, 68.74, 68.92, 69.07 (2C2', 2C3', 2C4'), 69.18–69.80 (6 signals for MeOCH_2), 71.38 and 72.96 (C2 or 4), 75.08 and 75.21 (CH_2Ph), 76.57 (C3), 80.35 and 81.91 (C2 or 4), 94.38 and 94.82 (C1'), 98.18 and 98.66 (C1'), 116.05 (q, CF_3 , J = 289 Hz), 127.7, 128.04, and 128.62 (CHAr), 137.31 (CqAr), 157.27 (q, COCF_3 , J = 36 Hz), 169.20, 169.34, 169.45, 169.78, 169.90, 170.01, 170.04, 170.19, 171.59, and 171.84 (CO). ¹⁹F NMR (376 MHz, CDCl_3): δ –75.81. HRMS (ESI): $[\text{M}+\text{H}]^+$ calcd for $\text{C}_{56}\text{H}_{80}\text{F}_3\text{N}_2\text{O}_{31}$: m/z = 1333.46916; found m/z = 1333.46832.

N-(6-Trifluoroacetamidohexanoyl)-2,4-bis-O-(2,3,4,6-tetra-O-methoxyacetyl- α -D-mannopyranosyl)-1,5-dideoxy-1,5-iminoxylitol (10). Compound **9** (542 mg, 0.407 mmol) was dissolved in a mixture of CH_2Cl_2 (15 mL) and EtOH (20 mL). 10% Palladium on carbon (100 mg) was added and the reaction mixture was vigorously stirred at rt under an atmosphere of H_2 for 18 h. The reaction mixture was then filtered through a Millipore membrane to remove the catalyst; the black solid was washed with a 1:1 mixture of CH_2Cl_2 and EtOH (2 \times 20 mL). The solvents were then evaporated to give compound **10** (496 mg, 98%). R_f = 0.59 (CH_2Cl_2 /acetone 2:1). ¹H NMR (250 MHz, CDCl_3): δ 1.30–1.48 (m, 2H, 2Hc), 1.53–1.76 (m, 4H, 2Hb, 2Hd), 2.29–2.48 (m, 2H, 2Ha), 2.49–2.71 (m, 1H, 0.5 H1A, 0.5 H5A), 2.90–3.21 (m, 1H, 0.5 H1A, 0.5 H5A), 3.30–3.60 (m, 27H, 8 \times CH_3 MAc + 2He + 1H), 3.60–3.75 (m, 1H), 3.81–4.40 (m, 22H, 8 \times CH_2 MAc, 4H6', H5', H1B/H5B), 4.40–4.53 (m, 1H, H5'), 4.60–4.78 (m, 1H, H1B/H5B), 5.02 (s, 0.5H, H1'), 5.03 (s, 0.5H, H1'), 5.20 (s, 0.5H, H1'), 5.23 (s, 0.5H, H1'), 5.25–5.52 (m, 6H,

2H2', 2H3', 2H4'), 7.12–7.22 (m, 0.5H, 0.5 NH), 7.23–7.34 (m, 0.5H, 0.5NH). ¹H NMR (400 MHz, $\text{DMSO}-d_6$, 90 °C): δ 1.30 (quint, 2H, Hc), 1.54 (2 overlapping quint, 4H, 2Hb, 2Hd), 2.36 (t, 2H, 2Ha), 2.6–3 (very broad, 1 \times H1, 1 \times H5), 3.18 (q, 1H, $J_{\text{He,Hd}} \sim 6.7$ Hz, $J_{\text{He,NH}} \sim 6.7$ Hz, 2He), 3.30, 3.31, 3.32, 3.325, 3.35, 3.36, 3.40, 3.41 (8s, 8 \times 3H, 8 \times OMe), 3.30–3.50, (br signals, 1 \times H1, 1 \times H5, H2, H4), 3.58 (dt, 1H, $J_{3,\text{OH}} = 5.2$ Hz, $J_{2,3} = J_{3,4} = 8.8$ Hz, H3), 3.86–4.13 (several s and AB systems, 16H, 8 CH_2OMe), 4.17 (m, 1H, H5'), 4.2–4.26 (m, 3H, 2H6'A, H6'B), 4.29 (dd, 1H, $J_{5',6'A} = 5.2$ Hz, $J_{6'A,6'B} = 12$ Hz, H6'B), 4.53 (dt, 1H, $J_{4',5'} = 10$ Hz, $J_{5',6'A} = J_{5',6'B} = 3.6$ Hz, H5'), 5.15 (br s, 1H, H1'), 5.18–5.27 (overlapping signals, 4H: 2H4', H2', H1'), 5.45 (dd, 1H, $J_{2',3'} = 3.2$ Hz, $J_{3',4'} = 10$ Hz, H3'), 5.41 (dd, 1H, $J_{2',3'} = 3.2$ Hz, $J_{3',4'} = 10$ Hz, H3'), 5.43 (1 narrow dd, H2'), 5.95 (d, 1H, $J_{3,\text{OH}} = 5.2$ Hz, HO-3), 9.02 (br signal, 1H, NH). ¹³C NMR (62.9 MHz, CDCl_3): δ 24.05 (Cb), 26.04 and 26.12 (Cc), 28.38 (Cd), 32.50 and 32.57 (Ca), 39.42 and 39.48 (Ce), 42.66, 44.08, 46.38, 47.91 (C1, C5, 4 signals), 59.39, 59.45 (CH_3 MAc), 62.30, 62.38, 62.60 (2H6', 3 signals), 66.00, 66.10, 66.18, 66.60, 68.53, 68.70, 68.38, 69.00, 69.13, 69.61, 69.63, 69.92 (2C2', 2C3', 2C4', 2C5'), 69.27, 69.31, 69.41, 69.52 (8 CH_2 MAc), 74.99, 75.72, 76.03, 76.07, 67.98, 78.38 (C2, C3, and C4, 6 signals), 95.93, 95.95, 98.80, 98.98 (2C1', 4 signals), 118.50 (q, CF_3 , J = 288 Hz), 157.29 (q, COCF_3 , J = 37 Hz), 169.25, 169.26, 169.27, 169.30, 169.38, 169.41, 169.43, 169.50, 169.53, 169.59, 169.77, 170.08, 170.19, 170.22 (8 COOR), 171.50, 171.70 (CONH). ¹⁹F NMR (376 MHz, CDCl_3): δ –75.82, –75.81. HRMS (ESI): $[\text{M}+\text{H}]^+$ calcd for $\text{C}_{49}\text{H}_{74}\text{F}_3\text{N}_2\text{O}_{31}$: m/z = 1243.42221; found m/z = 1243.42145.

N-(6-Trifluoroacetamidohexanoyl)-2,4-bis-O-(2,3,4,6-tetra-O-methoxyacetyl- α -D-mannopyranosyl)-3-O-[(2R)(2-hexadecanoyloxy-3-octadecanoyloxypropyl)-(benzyl)phosphoryl]-1,5-dideoxy-1,5-iminoxylitol (12). Phosphoramidite **11**¹⁷ (197 mg, 0.236 mmol, 1.4 equiv) was added to a solution of compound **10** (210 mg, 0.169 mmol) in dry CH_2Cl_2 (11 mL). The mixture was cooled down to 0 °C and a commercial solution of 1H-tetrazole in acetonitrile (~ 0.40 M), previously dried over 3 Å molecular sieves, was added (1.27 mL, 0.507 mmol, 3 equiv). The reaction mixture was stirred for 2 h at rt and then was cooled down to –17 °C. A solution of *m*CPBA (purity $\sim 50\%$) (175 mg, 0.507 mmol, 3 equiv) in CH_2Cl_2 (4 mL) dried over some MgSO_4 was then added dropwise. After keeping the mixture for 10 min at –10 to –15 °C and 1 h at rt, the reaction was quenched by the addition of saturated aqueous $\text{Na}_2\text{S}_2\text{O}_3$ (20 mL) and the entire mixture was extracted with Et_2O (2 \times 80 mL). The organic phases were combined and washed successively with saturated aqueous $\text{Na}_2\text{S}_2\text{O}_3$ (3 \times 15 mL), aqueous NaHCO_3 (15 mL), and brine (15 mL), and then dried over MgSO_4 . The solvent was removed in vacuum and the residue was purified by silica gel chromatography (toluene/acetone 3:1) to give compound **12** (160 mg, 47%). R_f Phosphite = 0.41 and R_f Phosphate = 0.31 (toluene/acetone 2:1). Note: the NMR data of **12** are complex because of amide rotamers, *P**-stereoisomers ($\neq 1:1$), and the nonequivalence of the mannosyl residues. ¹H NMR (400 MHz, CDCl_3): δ 0.88 (t, 6H, 2 CH_3 , J = 6.6 Hz), 1.03–1.50 (m, 54H, 26 CH_2 , 2Hc), 1.51–1.78 (m, 8H, 2Hd, 2Hb, 2 CH_2 acyl chain), 2.14–2.51 (m, 6H, 2Hb, 2 CH_2 acyl chain), 3.19–3.55 (m, 27H including 8 OCH_3), 3.55–4.49 (32H, including 8 CH_2OMe), 4.95–5.59 (m, 11H), 7.27–7.54 (m, 6H, 5CHar, NH). ¹³C NMR (62.9 MHz, CDCl_3): δ 14.12 (CH_3), 22.69 (CH_2), 23.77 and 23.87, 25.96 and 26.13, and 28.23 (Cb, Cc, Cd), 24.85

N-(6-Trifluoroacetamidohexanoyl)-2,4-bis-O-(2,3,4,6-tetra-O-methoxyacetyl-α-D-mannopyranosyl)-3-O-[(2R)(2-hexadecanoyloxy-3-octadecanoyloxypropyl)phosphoryl]-1,5-dideoxy-1,5-iminoxylitol (13). Compound 12 (158 mg, 0.079 mmol) was dissolved in a mixture of CH₂Cl₂ (6 mL) and EtOH (8 mL). 10% Palladium on charcoal (50 mg) was added and the reaction mixture was stirred at rt under H₂ atmosphere for 4 h. The catalyst was removed by filtration through a Millipore membrane. The solid was washed with a 1:1 mixture of CH₂Cl₂ and EtOH (2 × 10 mL). The organic phases were combined and the solvents were evaporated to give compound 13 as a white solid (142 mg, 95%). ¹H NMR (250 MHz, CDCl₃): δ 0.88 (t, 6H, CH₃, *J* = 6.8 Hz), 1.17–1.36 (m, 52H, 26CH₂), 1.36–1.52 (m, 2H, 2Hc), 1.52–1.78 (m, 8H, 2Hd, 2Hb, 2CH₂ acyl chain), 2.23–2.54 (m, 6H, 2Ha, 2CH₂ acyl chain), 3.21–3.51 (m, 26H, 8xOCH₃, 2He), 3.51–4.48 (m, 33H), 5.04 (s, 0.5H), 5.10 (s, 0.5H), 5.11 (s, 0.5H), 5.17 (s, 0.5H) (2 × H1'), 5.21–5.54 (m, 7H, 2H2', 2H3', 2H4', H2a), 7.34 (br, 0.5 NH), 7.49 (br, 0.5 NH). ¹³C NMR (62.9 MHz, CDCl₃): δ 14.15 (CH₃), 23.83 and 23.95, 26.03 and 26.20, 28.23 (br) and 32.27 (br) (4CH₂, Ca–Cd), 22.72, 24.91, 24.98, 29.2–29.8, 31.96, 32.27, 34.06, and 34.20 (CH₂ acyl chains), 39.43 and 39.45 (Ce), 39.70–39.89, 42.97–43.14, 44.28–44.67, 47.86–47.31 (4 broad signals for C1, C5), 59.11, 59.15, 59.27, 59.30, 59.39, 59.44 (6 signals for OCH₃), 62.10–62.56, 64.98–65.34, 65.74–66.05, 66.74, 68.42–70.42 (several signals), 71.55–71.74, 73.71–73.98, 74.60–74.97, 94.36 and 95.06 (C1'), 97.06 and 98.31 (C1'), 116.10 (q, CF₃, *J*_{C–F} = 288 Hz), 157.25 (q, COCF₃, *J*_{C–F} = 37 Hz), 169.35–169.78, 170.18, 170.25 (CO), 172.12, 172.42, 173.13, 173.43 (CONH, COOR). ³¹P NMR (162 MHz, CDCl₃): δ −1.57, −1.44. ¹⁹F NMR (376 MHz, CDCl₃): δ −75.78, −75.75. HRMS (ESI): [M+H]⁺ calcd for C₈₆H₁₄₅F₃N₂O₃₈P: *m/z* = 1901.91596; found *m/z* = 1901.91178.

N-(6-Trifluoroacetamidohexanoyl)-2,4-bis-O-(α-D-mannopyranosyl)-3-O-[(2R)(2-hexadecanoyloxy-3-octadecanoyloxypropyl)phosphoryl]-1,5-dideoxy-1,5-iminoxylitol (1). Compound 13 (135 mg, 0.071 mmol) was dissolved in a 1:4 mixture of CHCl₃ and MeOH (2 mL). The reaction mixture was cooled down to 0 °C and *t*-butylamine

(164 μL) was added. The mixture was stirred at 0 °C for 10 min then warmed up to rt and stirred for an additional 2 h; solvents were evaporated without heating and the residue was purified by flash chromatography (CHCl₃/MeOH/H₂O 70/40/1) to give compound 1 (73 mg, 78%) as an amorphous solid. *Note:* Under these conditions, the COCF₃ group is not cleaved. ¹H NMR (400 MHz, CDCl₃/CD₃OD 0.35/0.2 mL; lock on CD₃OD; presence of amide rotamers in a ratio of about 2:1): δ 0.86 (t, 6H, CH₃, *J* = 6.8 Hz), 1.17–1.35 (m, 52H, 26 CH₂), 1.35–1.43 (m, 2H, 2Hc), 1.52–1.69 (m, 8H, 2Hd, 2Hb, 2CH₂ acyl chain), 2.31 (2 t, 4H, 2CH₂ acyl chain, *J* = 7.6 Hz), 2.44 (t, 2H, 2Ha, *J* = 7.2 Hz), 3.28 (app t, 2H, He, *J* = 7.1 Hz), 3.39–3.95 (m, 16H), 3.95–4.03 (m, 2H, 2H1a), 4.08–4.28 (m, 2H incl. H3aA), 4.28–4.41 (m, 2H), 4.44 (dd, 1H, H3aB, *J* = 2.6, 12.1 Hz), 4.95 (s, 0.3H, H1'), 4.98 (s, 0.7H, H1'), 5.02 (s, 0.3H, H1'), 5.09 (s, 0.7H, H1'), 5.18–5.29 (m, 1H, H2a). ¹³C NMR (62.9 MHz, CDCl₃/CD₃OD 0.35/0.2 mL; lock on CD₃OD): δ 14.39 (CH₃), 25.45 and 25.50, 27.09, 29.13, 33.16, and 33.30 (Ca–Cd), 23.33, 25.59, 25.64, 29.8–30.4, 32.63, 34.73, 34.88 (acyl CH₂), 40.27 and 40.32 (Ce), ~48–49 (broad, C1/C5), 61.89 (broad, C6'), 62.27 (broad, C6'), 63.44 (C3a), 64.36 (broad, C1a), 67.61, 68.26, 71.05, 71.19, 71.30, 71.69, 71.92, 72.27, 74.06, 74.29, 74.73 (all CH), 97.57 (C1'), 99.25 (C1'), 99.81 (C1'), 101.39 (C1'), 116.94 (q, CF₃, *J*_{C–F} = 287 Hz), 158.61 (s, COCF₃, *J*_{C–F} = 37 Hz), 174.12, 174.41, 174.60, 174.76 (CO's). ³¹P NMR (162 MHz, CDCl₃/CD₃OD 0.35/0.2 mL): δ −0.49. ¹⁹F NMR (376 MHz, CDCl₃): δ −76.66, −76.78. HRMS (ESI): [M+H]⁺ calcd for C₆₂H₁₁₃F₃N₂O₂₂P: *m/z* = 1325.74692; found *m/z* = 1325.74709.

N-(6-Trifluoroacetamidohexanoyl)-2,4-bis-O-(2,3,4,6-tetra-O-methoxyacetyl-α-D-mannopyranosyl)-3-O-[(2R)(2,3-bis(hexadecyloxy)propyl)(benzyl)phosphoryl]-1,5-dideoxy-1,5-iminoxylitol (15). Compound 14¹⁹ (318 mg, 0.409 mmol, 1.4 equiv) and compound 10 (358 mg, 0.288 mmol) were separately dried overnight under vacuum over P₂O₅. CH₂Cl₂ (6 mL) was added to compound 10 and CH₂Cl₂ (3 mL) was added to compound 14 under Ar. The solution of compound 14 was added to the solution of compound 10 and the flask rinsed with 1 mL of CH₂Cl₂. Molecular sieves (3 Å) were added, and after 15 min, the solution was cooled down to 0 °C. A commercial solution of 1H-tetrazole in acetonitrile (~0.45 M) (1.92 mL, 0.864 mmol, 3 equiv), previously dried over 3 Å molecular sieves, was then added. The reaction mixture was stirred for 2 h at rt and was then cooled to −17 °C. A solution of *m*CPBA (purity ~50%) (298 mg, 0.864 mmol, 3 equiv) in CH₂Cl₂ (4 mL) dried over some MgSO₄ was then added dropwise. After having been stirred for 10 min at −15 to −10 °C and 1 h at rt, the reaction was quenched by the addition of saturated aqueous Na₂S₂O₃ (20 mL). The whole mixture was extracted with Et₂O (2 × 90 mL). The organic phases were combined and washed successively with saturated aqueous Na₂S₂O₃ (3 × 20 mL), aqueous NaHCO₃ (20 mL), and brine (20 mL), and then dried (MgSO₄). The solvent was removed in vacuum and the residue was purified by silica gel column chromatography (CH₂Cl₂/acetone 3/1) to give compound 15 (238 mg, 43%) as a syrup. *R*_f phosphate = 0.42 and *R*_f phosphate = 0.27 (CH₂Cl₂/acetone 4/1). *NMR data are complex because of amide rotamers, P*-isomers, and non-equivalence of the mannosyl residues.* ¹³C NMR (62.9 MHz, CDCl₃): δ 14.12 (CH₃), 23.72 and 23.82, 25.94 and 26.1, 28.12 and 28.25, and 32.16 (Ca–Cd), 22.68, 26.05, 26.09, 29.4–30.0, 31.92 (CH₂ acyl chains), 39.38 (Ce), 38.92–39.20 (broad),

HRMS (ESI): [M-H][–] calcd for C₆₀H₁₁₁F₃N₂O₂₀P: *m/z* = 1267.74254; found *m/z* = 1267.74310.

N-(6-Aminohexanoyl)-2,4-bis-O-(α-D-mannopyranosyl)-3-O-[(2R)(2,3-bis(hexadecyloxy)propyl)phosphoryl]-1,5-dideoxy-1,5-iminoxylitol (17). Compound 2 (23 mg, 0.018 mmol) was dissolved under Ar in MeOH (2 mL). A solution of MeONa was prepared (~8 mg Na in MeOH (2 mL)) under Ar. This solution was transferred to the solution of compound 2. The reaction mixture was then stirred for 40 h at 25 °C under vacuum (~0.4 bar) to trap methyl trifluoroacetate (bp = 43–43.5 °C) until complete deprotection. The base was neutralized with AcOH (2 drops) and the solvent was evaporated to give compound 17 containing sodium acetate. *R*_f (2) = 0.78, *R*_f (17) ~0.1 (CH₂Cl₂/MeOH/D₂O 70/40/6) (pink in ninhydrin spot test). ¹H NMR (400 MHz, CDCl₃/CD₃OD 0.4/0.3 mL – lock on CD₃OD): δ 0.85 (CH₃), 1.15–1.34 (m, 52H), 1.34–1.47 (m, 2H, 2Hc), 1.47–1.59 (m, 4H, 2CH₂ alkyl chain), 1.59–1.74 (m, 4H, 2Hb, 2Hd), 2.25–2.39 (m, 1H, HaA), 2.42–2.63 (m, 1H, HaB), 2.80–3.00 (m, 2H, 2He), 3.01–3.16 (m, 1H), 3.39–3.50 (m, 4H, OCH₂ alkyl chain +2H), 3.50–3.99 (several m, 21H), 4.26–4.63 (m, 2H), 4.93–5.03 (2 br s, 1.4H, H1'), 5.08–5.16 (m, 0.6H, H1'). ³¹P NMR (162 MHz, CDCl₃): δ 0.197 ppm. ¹⁹F NMR (376 MHz, CDCl₃/CD₃OD 0.4/0.3): δ –76.39 (trace of fluorinated impurity, probably CF₃COONa). HRMS (ESI): [M+H]⁺ calcd for C₅₈H₁₁₄N₂O₁₉P: *m/z* = 1173.77479; found *m/z* = 1173.77413.

N-(6-Biotinylamidoheptanoyl)-2,4-bis-O-(α-D-mannopyranosyl)-3-O-[(2R)(2,3-bis(hexadecyloxy)propyl)-

phosphoryl]-1,5-dideoxy-1,5-iminoxylitol (3). Compound 17 (20 mg, 0.0167 mmol) was dissolved in dry DMF (0.5 mL) under Ar; 0.5 mL of CH_2Cl_2 was then added to increase solubility. Et_3N (116 μL , 0.084 mmol, 5 equiv) was added, then (+)-biotin *N*-hydroxysuccinimide ester (6.9 mg, 0.02 mmol, 1.2 equiv). The mixture was stirred for 5 h under Ar. The solvents were evaporated under vacuum. The residue was purified by gel permeation chromatography on Sephadex LH-20 (diam = 25 mm, H = 400) with $\text{MeOH}/\text{CH}_2\text{Cl}_2$ 2/1 as the eluent (V_0 = 15 mL, fractions = 5 mL, collecting compound in tubes 14 to 19) to give the expected biotinylated derivative 3 (17 mg, 74%) as a white solid. R_f (3) = 0.35 ($\text{CH}_2\text{Cl}_2/\text{MeOH}/\text{D}_2\text{O}$ 70/40/6). ^1H NMR (400 MHz, $\text{CDCl}_3/\text{CD}_3\text{OD}$ 0.35/0.2 mL + 1 drop D_2O – lock on CD_3OD ; amide rotamers in ratio ~2:1): δ 0.85 (CH_3), 1.15–1.45 (m, 58H), 1.45–1.75 (m, 10H), 2.19 (t, 2H, 2H_1), 2.26–2.49 (m, 2H, 2Hb), 2.71 (d, 1H, $\text{H}_{\text{D}}\text{A}$, J = 12.4 Hz), 2.9 (dd, 1H, $\text{H}_{\text{D}}\text{B}$, J = 4.8, 12.4 Hz), 3.06–3.22 (m, 4H, 2Hf , 2H_E), 3.39–4.0 (several m, 28H), 4.26–4.34 (m, 1H, H_B), ~4.5 (hidden by HOD, H_C), 4.92 (s, 0.31H, $\text{H}1'$), 4.95 (s, 0.69H, $\text{H}1'$), 5.01 (s, 0.3 H, $\text{H}1'$), 5.09 (s, 0.7H, $\text{H}1'$). ^{13}C NMR (62.9 MHz, $\text{CDCl}_3/\text{CD}_3\text{OD}$ 0.35/0.2 mL + 1 drop of D_2O – lock on CD_3OD): δ 14.37 (CH_3), 23.14, 25.23, 26.53, 26.53, 26.60, 27.06, 28.60, 28.86, 29.35, 29.84, 30.06, 30.20, 30.88, 32.41, 32.92, 36.15, 39.74 and 39.81, 40.72 (all CH_2), 56.24 (CH), 60.81 (CH), 61.87 (broad, CH_2), 62.51, 65.74 (broad), 67.35 (CH), 68.11 (broad, CH), 68.83 (CH_2), 70.17–70.45 (broad, CH_2), 70.85 (broad, CH_2), 71.13 (CH), 71.22 (OCH_2 alkyl), 71.38 (CH), 71.53 (CH), 71.71 (CH), 72.32 (OCH_2 alkyl), 74.00 (CH), 74.48 (CH), 78.16 (CH), 97.36 ($\text{C}1'$), 98.28 ($\text{C}1'$), 100.57 ($\text{C}1'$), 103.50 ($\text{C}1'$), 165.07 and 165.10 (CO biotin), 174.61 (CONH), 175.34 (CONH). ^{31}P NMR (162 MHz, $\text{CDCl}_3/\text{CD}_3\text{OD}$ 0.35/0.2 mL + 1 drop of D_2O): δ – 1.856 ppm. ^{19}F NMR (376 MHz): no signal. HRMS (ESI): $[\text{M}+\text{H}]^+$ calcd for $\text{C}_{68}\text{H}_{128}\text{N}_4\text{O}_{21}\text{PS}$: m/z = 1399.85239; found m/z = 1399.85097.

Tetramethylrhodamine-Labeled *N*-(6-aminohexanoyl)-2,4-bis-*O*-(α -D-mannopyranosyl)-3-*O*-[(2*R*)(2,3-bis-(hexadecyloxy)propyl)phosphoryl]-1,5-dideoxy-1,5-iminoxylitol (4). Compound 17 (21 mg, 0.0176 mmol) was dissolved in dry DMF (1 mL) under Ar. Et_3N (100 μL , 0.724 mmol, 41 equiv) was added followed by tetramethylrhodamine isothiocyanate (TRITC, mixture of 5- and 6-isomers; 10 mg, 0.02 mmol, 1.1 equiv). The mixture was stirred for 15 h under Ar. The solvent was then removed under vacuum. The residue was first submitted to gel permeation chromatography on Sephadex LH-20 (diam = 25 mm, H = 400 mm) with $\text{MeOH}/\text{CH}_2\text{Cl}_2$ 2/1 as the eluent. A second purification by flash chromatography ($\text{CH}_3\text{Cl}_3/\text{MeOH}/\text{D}_2\text{O}$ 70/40/5) was necessary to give pure compound 4 (15 mg, 52%) as an amorphous magenta solid. R_f ~0.63 ($\text{CH}_3\text{Cl}_3/\text{MeOH}/\text{D}_2\text{O}$ 70/40/6). ^1H NMR (250 MHz, $\text{CDCl}_3/\text{CD}_3\text{OD}$ 0.35/0.2 mL; lock CDCl_3 ; calibration TMS): δ 0.88 (t, 6H, 2CH_3 , J = 6.5 Hz), 1.11–1.46 (m, 54H), 1.47–1.74 (m, 8H), 2.27–2.55 (m, 2H, 2Ha), 3.00–3.31 (m, 12H, 4CH_3 –Rh), 3.39–4.00 (30H), 4.96 (br s, 0.3H, $\text{H}1'$), 4.99 (br s, 0.7H, $\text{H}1'$), 5.08 (br s, 0.3H, $\text{H}1'$), 5.18 (br s, 0.7H, $\text{H}1'$), 6.67 (s, 2H, 2CH –Rh), 6.80–6.87 (m, 2H, 2CH –Rh), 7.20–7.45 (m, 3H, 3CH –Rh), 7.87–8.18 (2H, 2CH –Rh). ^{13}C NMR (126 MHz, $\text{CDCl}_3/\text{CD}_3\text{OD}$ 0.35/0.2 mL – lock CDCl_3 – Calibration CDCl_3): δ 13.58 (CH_3), 22.34, 24.59, 24.78, 25.78, 25.82, 26.43, 28.12, 29.0–29.7, 31.62, 32.14 (C_b , major rotamer), 32.39 (C_a , minor rotamer), 38.93, 40.09 (CH_3 –Rh), 43.84, 46.70, 60.23, 61.11, 61.33, 64.98, 66.22, 66.41, 67.29, 68.05–68.47 (broad), 69.74, 69.91, 70.14, 70.33,

70.38 (OCH_2), 70.50, 70.69, 70.91, 71.47 (OCH_2), 72.93, 73.13, 73.55, 77.35, 77.65, 77.71, 96.23 (CHAr –Rh), 96.33 (broad, $\text{C}1'$), 97.54 (broad, $\text{C}1'$), 112.72 (CHAr –Rh), 121.79 (broad, CAr –Rh), 122.58 (broad, CAr –Rh), 129.77 (CHAr –Rh), 131.34 (CHAr –Rh), 141.88 (broad, CAr –Rh), 156.05 (minor rotamer), 156.14 (major), 156.61 (minor), 156.69 (major) (CAr –Rh), 171.09 (COOH –Rh), 173.11 (CONH minor rotamer), 173.57 (CONH major), 180.24 (CS). ^{31}P NMR (162 MHz, $\text{CDCl}_3/\text{CD}_3\text{OD}$ 0.35/0.2 mL – lock CDCl_3): δ 4.05 (minor rotamer), 4.26 (major rotamer). ^{19}F NMR (376 MHz): no signal. HRMS (ESI): $[\text{M}+\text{H}]^+$ calcd for $\text{C}_{83}\text{H}_{135}\text{N}_5\text{O}_{22}\text{PS}$: m/z = 1616.905155; found m/z = 1616.903886.

BIOLOGICAL PROCEDURES

Bioassays. Murine bone marrow cells harvested from femurs were cultivated ($10^6/\text{mL}$) for 7 days in Dulbecco's minimal essential medium (DMEM) supplemented with 2 mM L-glutamine, 20% horse serum, and 30% L929 cell-conditioned medium as a source of M-CSF. After three further days in fresh medium, the bone marrow-derived macrophages (BMDM; 10^5 cells/well) in DMEM supplemented with 2 mM L-glutamine, 2×10^{-5} M β -mercapto-ethanol, and 0.1% fetal calf serum (FCS) were stimulated with 100 ng/mL of LPS (*Escherichia coli*, serotype O111:B4, Sigma, St. Louis, MO) in the presence of IFN- γ (500 U/mL). Lyophilized PIM preparations were solubilized in DMSO and used at a noncytotoxic, maximum 1% DMSO final concentration. PIM or DMSO vehicle controls were added 30 min prior to LPS stimulation (100 ng/mL). Absence of cytotoxicity was controlled using MTT incorporation. Cell culture supernatants were harvested after 24 h at 37 °C and TNF α and IL-12p40 cytokine content were measured using commercially available ELISA Kits (Duoset R&D Systems, Abingdon, U.K.). Nitrite was determined using the Griess reaction (3% phosphoric acid, 1% *p*-aminobenzenesulfonamide, 1% *N*-(1-naphthyl)ethylenediamine). Results are expressed as percent of inhibition as compared with full release in the presence of LPS plus DMSO vehicle.

Immunoassay. Biotinylated PIM₂ derivative 3 at the indicated concentrations in PBS (100 $\mu\text{L}/\text{well}$) was coated on a microtiter plate and incubated overnight at room temperature. After saturation with 1% BSA in PBS (200 $\mu\text{L}/\text{well}$) for 1 h at room temperature and three washings with 0.05% Tween 20-PBS, the bound PIM–biotin was revealed by incubation with horseradish peroxidase–streptavidin D conjugate (1/2000, Vector Laboratories) diluted in 1% BSA in PBS, for 20 min at room temperature. After addition of the substrate (ABTS, 2,2'-azinobis[3-ethylbenzothiazoline-6-sulfonic acid] diammonium salt, at 0.3 g/L in 0.1 M anhydrous citric acid containing 0.3% H_2O_2) for 20 min at room temperature, absorbance at 405 nm was measured with a microplate reader (Bio-Tek Instrument, Inc.).

Flow Cytometry. Macrophages (1×10^6 cells in 50 μL DMEM containing 0.2% FCS) were incubated with biotinylated PIM₂ derivative 3 at the indicated concentrations in PBS (100 $\mu\text{L}/\text{well}$) for 1–30 min at 37 °C under gentle agitation. Cells were washed with ice-cold PBS and stained with streptavidin–Alexa A532 conjugate (diluted 100 \times in cold PBS) for 15 min. After further washings and fixation with 3% paraformaldehyde (PFA), fluorescent cells were analyzed on a FACS Canto II equipment (BD Bioscience, San Jose, Ca, USA) using a Tree Star software entitled *FlowJo* (Trustees of Leland

Stanford Jr. University, Stanford, CA, USA). Cytotoxicity was controlled by 7-amino-actinomycin (7-AAD) staining.

Confocal Microscopy. Macrophages adsorbed on glass microslides (1×10^5 cells in $200 \mu\text{L}$ DMEM containing 5% FCS) overnight at 37°C and rinsed once with PBS were incubated with biotinylated-PIM₂ conjugate **3** ($5 \mu\text{g/mL}$ in DMEM containing 1% FCS for 10 min at 37°C). After rapid fixation (1 min at RT in 4% PFA) and rinsing in PBS, cells were incubated with Streptavidin–Alexa 532 fluorescent conjugate ($10 \mu\text{g/mL}$ for 15 min at RT) and fixed (10 min at RT in 4% PFA). The microslides were then washed twice with PBS, mounted in Vectashield medium (Vector Laboratories, Inc., Burlingame, CA, USA), and analyzed by confocal microscopy.

RESULTS AND DISCUSSION

Synthesis of a *N*- ω -Aminocaproyl Derivative of aza-PIM₂ in Ester Series (1). The first objective of the project was

Figure 2. Ester series: N-TFAC (*N*- ω -TriFluoroAcetamidoCaproyl) precursor **1**.

Scheme 1. Synthesis of Precursor 10 (Diester Series)

Conditions: (a) EtOH, H₂, 20% Pd(OH)₂/C, quant.; (b) CF₃CONH-(CH₂)₅COOH, CH₂Cl₂, HOBT, DCC, 60%; (c) **8** (2 equiv), TMSOTf, CH₂Cl₂, 37%; (d) CH₂Cl₂/EtOH, H₂, 10% Pd/C, 98%.

the synthesis of an aza-PIM₂ mimic carrying an *N*-aminocaproyl residue protected with a COCF₃ group (N-TFAC precursor **1**, Figure 2) which could be used to tether various reporter groups after deprotection. This compound was prepared from iminoxylitol **6** by the sequence of reactions described in Schemes 1 and 2.

The synthesis of the previously described iminoxylitol derivative **6**^{17,18} was significantly improved: selective cleavage of the *N*-benzyl group²⁰ could be achieved quantitatively by catalytic hydrogenolysis of purified **5** using Pearlman's catalyst.

Scheme 2. Synthesis of Diester Precursor 1

Conditions: (a) **11**, CH₂Cl₂, 1*H*-tetrazole, then *m*CPBA, 47%; (b) H₂, 10% Pd/C, CH₂Cl₂/EtOH, 95%; (c) MeOH/CH₂Cl₂, *t*BuNH₂, 45 min, -17°C , 78%.

Figure 3. Ether series: N-TFAC precursor **2**.

Scheme 3. Synthesis of Diether Precursor 2

Conditions: (a) **14**, CH₂Cl₂, 1*H*-tetrazole, then *m*CPBA, 43%; (b) MeOH/CHCl₃, *t*BuNH₂, -17°C , 82%; (c) H₂, CH₂Cl₂/EtOH, 10% Pd/C, 90%.

N-Acylation followed by double glycosylation using the trichloroacetimidate of tetra-*O*-methoxyacetyl- α -D-mannopyranose (**8**) and *O*-debenzylation afforded the protected precursor **10** in good yield (Scheme 1).

Compound **10** was then phosphorylated by reaction with phosphoramidite **11**¹⁷ and oxidation of the resulting phosphite to give phosphotriester **12** in 47% yield^a (Scheme 2). The benzyl phosphate group was then cleaved by hydrogenolysis and the mannose residues deprotected from methoxyacetate groups by reaction with *t*-butylamine in methanol, to provide the diester precursor **1** in 78% yield.

We showed earlier that a mimetic of PIM₂ in which the cyclitol is replaced by a 3-C glycerol scaffold could recapitulate the inhibitory activity of natural PIM₂ purified from *M. bovis* BCG on LPS-induced macrophage release of IL-12p40 and IL-10.¹² PIM₂ mimetic also reproduced the inhibitory activity of natural PIM₂ on TNF and NO release, while being non-cytotoxic (data not shown). Aza-PIM₂-NTfa (**1A**) and Oxa-PIM₂ (**1B**) retained the activity of PIM₂ mimetic and were at least as active as PIM₂ mimetic for inhibition of TNF, IL-12 p40, and NO release by LPS-induced macrophages, with **1B**

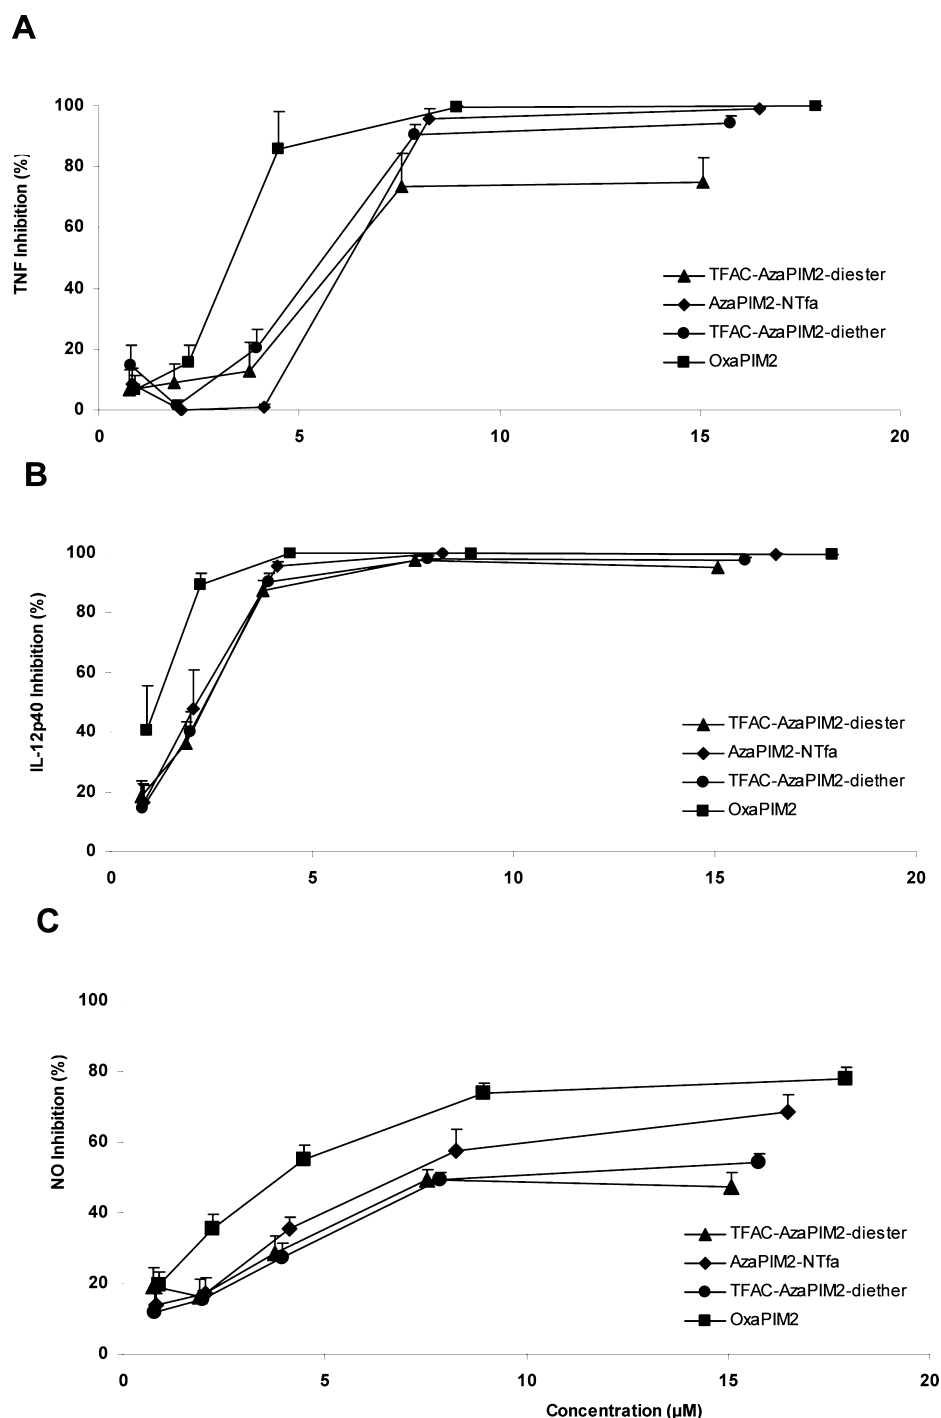

Figure 4. Both ester and ether forms of PIM₂ heterocyclic analogues inhibit TNF α , IL-12p40, and NO release by LPS-stimulated macrophages. Bone marrow-derived macrophages were incubated for 24 h with LPS in the presence of increasing concentrations of oxa-PIM₂ analogue (**IB**), aza-PIM₂ analogue (**IA**), compound **1** (TFAC-AzaPIM₂-diester), and compound **2** (TFAC-AzaPIM₂-diether). TNF α (**A**), IL-12p40 (**B**), and NO (**C**) concentrations were measured in the supernatants. Results are expressed as percent of inhibition of the control stimulation performed with LPS plus vehicle and represent the mean \pm SEM of $n = 4$ values from two independent experiments.

(Oxa-PIM₂) being slightly more active than **IA** (AzaPIM₂-NTfa) (Supporting Information Figure 1). The ability of AzaPIM₂-diester derivative **1** to inhibit LPS-induced pro-inflammatory response was tested on murine bone marrow-derived macrophages (see Figure 4A–C). Compound **1** inhibited the release of TNF α , IL-12p40, and NO essentially as strongly as precursor **IA**. The aza-derivatives were slightly less potent than the oxa PIM₂ analogue **IB**, which is shown as a

reference. Thus, the addition of the aminocaproyl spacer did not alter the immuno-modulating activity of the parent aza-PIM₂.

Further elaboration of **1** revealed, however, that the chemical synthesis of conjugated derivatives from **1** would not be successful: indeed under the basic conditions required to remove the N-COCF₃ group,²¹ the cleavage of the fatty acid esters occurred more rapidly. We therefore decided to replace

Scheme 4. Synthesis of 3 and 4 from 2

Conditions: (a) MeOH, NaOMe, 40 h, 25 °C, 0.4 bar; (b) DMF, Et₃N, CH₂Cl₂, (+)-biotin *N*-succinimide ester, 5 h, 74% ; (c) DMF, Et₃N, TRITC, 15 h, 52%.

the glycerol esters with ethers and to proceed with PIM mimics carrying a di-*O*-hexadecyl glycerol unit as in compound **2** (Figure 3). Previous work has already shown that esters can be replaced by ether linkages in PIMs without loss of biological activity;^{16,19} subtle differences, however, have been recently observed between PIM₂ analogues carrying one alkyl chain at *sn*-2 or at *sn*-1 glycerol position or two alkyl chains in their ability to induce cytokine (IL-6) production by macrophages (agonist effect), but all three types of compounds retained the ability of the diester to inhibit LPS-induced production of this cytokine by the same immune system cells.¹⁶

Synthesis of a *N*- ω -Aminocaproyl Derivative of aza-PIM₂ in Ether Series (2**).** The synthesis of the di-*O*-hexadecyl analogue of **1**, compound **2**, was achieved from **10** by coupling with phosphoramidite **14**,¹⁹ oxidation, and deprotection of the resulting benzyl phosphate to afford compound **16** (Scheme 3). The methoxyacetyl groups of **16** could be cleaved selectively without affecting the trifluoroacetamido group in high yield (82%) using *t*-butylamine in MeOH, thus providing diether precursor **2**. The biological activity of AzaPIM₂-diether **2** was tested on LPS-stimulated macrophages, and a clear, dose-dependent inhibition of TNF α , IL-12p40, and NO release documented (Figure 4A–C). Therefore, diether **2** retained the immuno-modulating activity of the corresponding diester **1** and of the parent aza-PIM₂ (**1A**).

Synthesis of 3 and 4 from 16. Cleavage of the trifluoroacetyl group from **2** required the use of sodium methoxide in MeOH. This reaction was performed under

reduced pressure to eliminate methyl trifluoroacetate. This provided the key aza-PIM₂ derivative **17** functionalized for conjugation or coupling with various markers (Scheme 4). The fully deprotected PIM₂ mimic **17** could be coupled in one step to (+)-biotin using biotin *N*-succinimidyl ester derivative to give conjugate **3** in 74% yield. Compound **17** was also engaged in a coupling reaction with TRITC (tetramethylrhodamine isothiocyanate) and gave the corresponding labeled derivative **4** (as a mixture of two isomers at the phenyl group). Both compounds were fully characterized before they were engaged in biological studies.

The biological activity of biotinylated-PIM₂ conjugate **3** was first tested in terms of inhibition of pro-inflammatory cytokine release by LPS-stimulated macrophages. The dose-dependent inhibition of TNF α , IL-12p40, and NO release was at least as good as the activity measured with the diether precursor **2** (Figure 5A–C). Dipalmitoyl phosphatidyl inositol PI, used as a non-mannosylated, negative control, exhibited strongly reduced inhibitory activity. None of the compounds induced cytotoxicity at the concentrations investigated, as measured by MTT assay (data not shown). Therefore, biotinylated PIM₂ mimics **3** retain the immuno-modulating activity of the parent PIM₂ diether **2**.

In contrast, the derivative labeled with rhodamine (**4**) appeared to be cytotoxic for macrophages in our culture conditions, as observed by microscopy, while standard MTT or NO release assays were hampered by the strong absorption of the compound. Although IL-12p40 production seemed to be

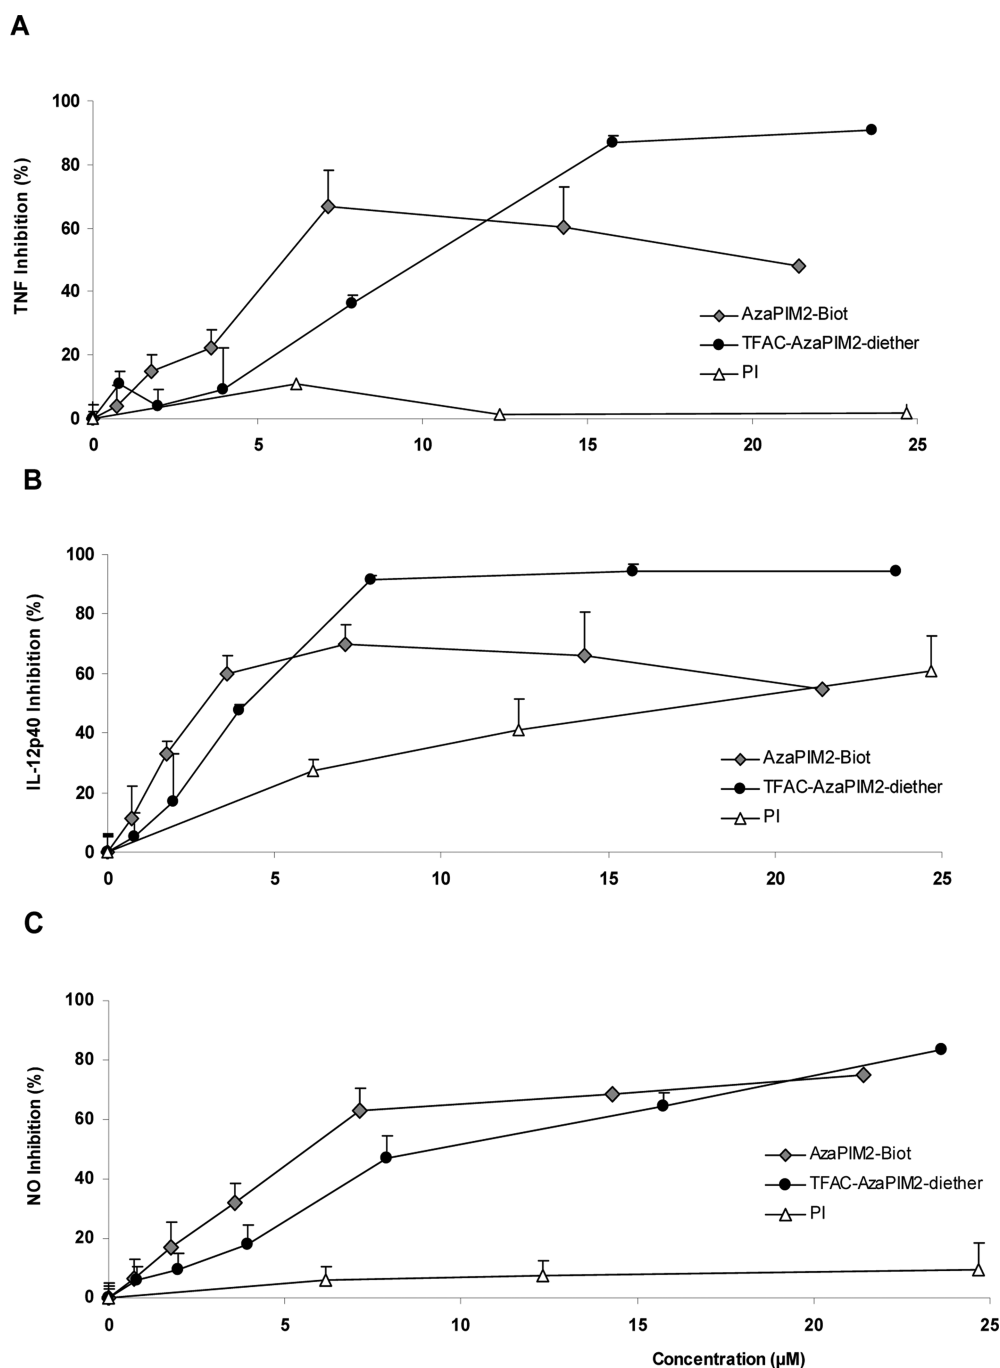

Figure 5. Biotinylated PIM₂ derivative 3 retains inhibitory activity on TNF α , IL-12p40, and NO release by LPS-stimulated macrophages. Bone marrow-derived macrophages were incubated for 24 h with LPS in the presence of increasing concentrations of biotinylated-PIM₂ conjugate 3 (AzaPIM₂-Biot), precursor 2 (TFAC-AzaPIM₂-diether), and dipalmitoyl phosphatidyl inositol (PI) as a negative control. TNF α (A), IL-12p40 (B), and NO (C) concentrations were measured in the supernatants. Results are expressed as percent of inhibition of the control stimulation performed with LPS plus vehicle and represent the mean \pm SEM of $n = 6$ values from 3 independent experiments representative of 4 independent experiments.

slightly decreased in the presence of labeled derivative 4, an effect which may be linked to the cytotoxicity of this compound, it is worth noting that TNF α release was not inhibited at concentrations up to 20 μ g/mL (data not shown). Further titration and kinetic studies will be needed to fully assess how this compound might be used. PIM cellular labeling was thus further investigated with biotinylated-PIM₂ conjugate 3.

Functional Characterization of Biotinylated PIM Derivative. For functional characterization, aza-PIM-biotin conjugate 3 was first titrated in a solid phase assay (Figure 6A).

Biotinylated PIM was adsorbed onto a solid phase in a microtiter plate overnight at room temperature and revealed by incubation with a streptavidin–peroxidase conjugate, followed by substrate addition and spectrophotometric detection of the colored product. Dose-dependent coating of the biotinylated PIM was detected at concentrations from 0.05 to 1 μ g/mL. There was no further increase in PIM-biotin adsorption at concentrations of 1–20 μ g/mL (not shown). Thus, the biotin moiety grafted on the PIM molecule was stable in our

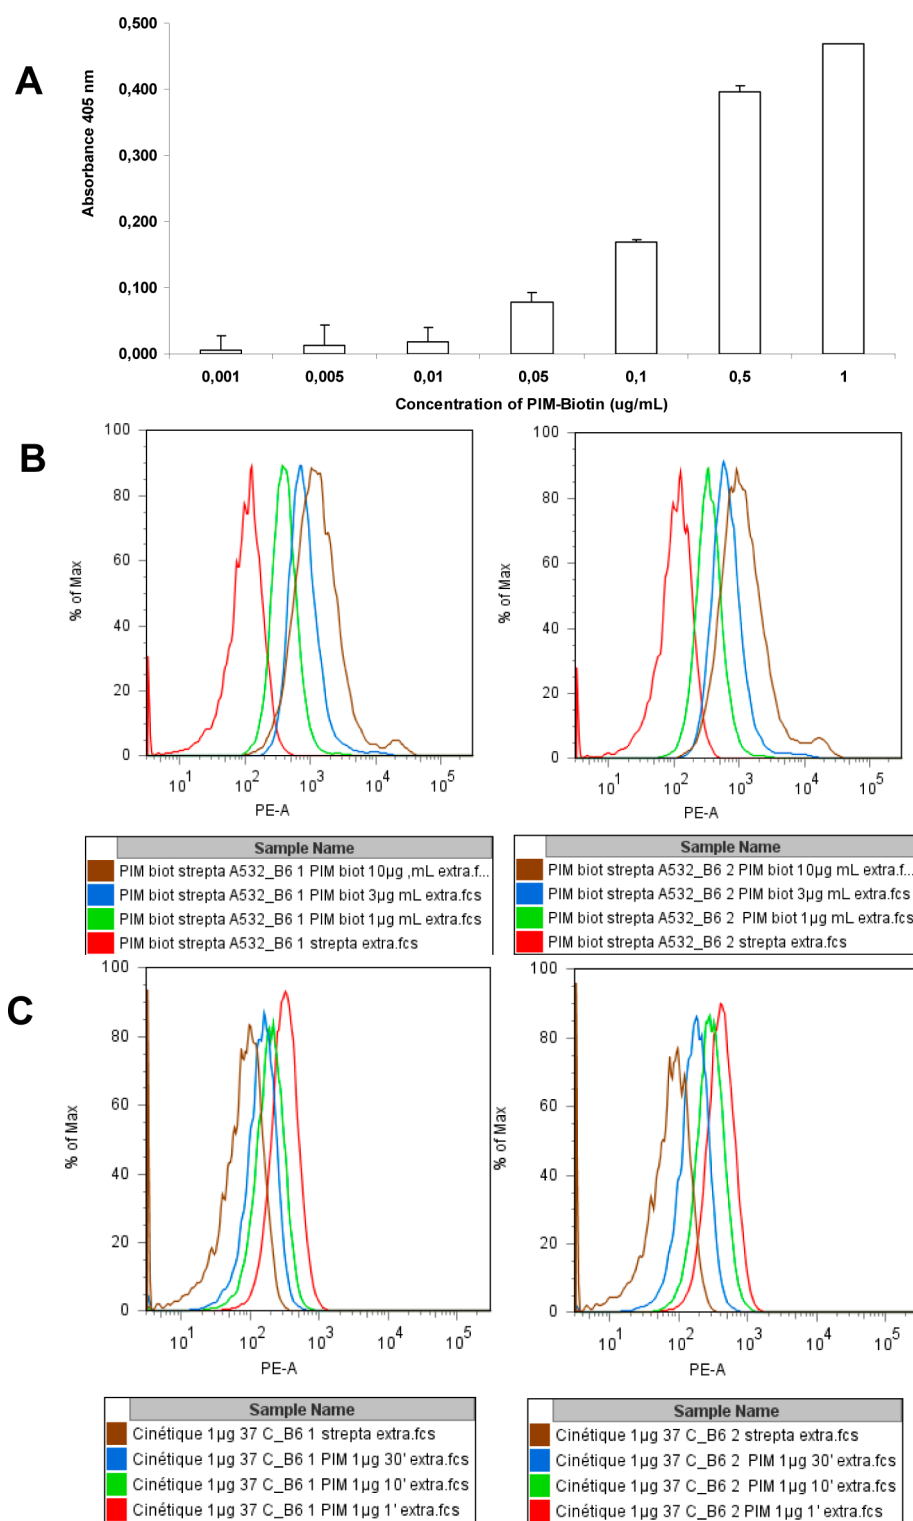

Figure 6. Biotinylated-PIM₂ derivative 3 is detected by fluorescent streptavidin conjugate and labels macrophages: (A) Aza-PIM₂-biotin conjugate 3 at increasing concentrations (0.001–1 µg/mL) was adsorbed onto a microtiter plate overnight at room temperature. After saturation of the free binding sites and washings, bound PIM-biotin was revealed with a streptavidin–peroxidase conjugate, followed by substrate addition and spectrophotometric detection of the colored product at 406 nm. (B) Macrophages were incubated with biotinylated-PIM₂ conjugate 3 (1, 3, and 10 µg/mL) for 30 min at 37 °C and cell-bound biotin detected by flow cytometry using a streptavidin–Alexa 532 fluorescent conjugate (10 µg/mL). (C) Kinetic study of biotinylated-PIM₂ binding to macrophages revealed a strong labeling already after 1 min incubation with conjugate 3 (1 µg/mL), which was less pronounced after 10 and 30 min. Results from 2 independent macrophage populations from two different mice are shown in B and C.

experimental conditions and could be detected by binding of a labeled streptavidin conjugate.

To further evaluate whether biotinylated PIM functionally bind immune cells, bone marrow-derived macrophages were

Figure 7. Subcellular localization of biotinylated PIM conjugate **3** on macrophages. Macrophages adsorbed on glass microslides overnight at 37 °C were incubated with biotinylated-PIM₂ conjugate **3** (5 µg/mL for 10 min at 37 °C). Cell-bound biotin was detected using a streptavidin–Alexa 532 fluorescent conjugate (10 µg/mL). Red labeling indicative of a membrane localization of the PIM–biotin conjugate (left) and the corresponding cell morphology (right) are shown. Negative controls with streptavidin conjugate alone showed no background fluorescence (not shown).

incubated in the presence of increasing concentrations of PIM–biotin and cell-associated biotin detected by flow cytometry using a streptavidin–Alexa 488 fluorescent conjugate (Figure 5B). A dose-dependent labeling of macrophages was evident at PIM–biotin conjugate concentrations of 1 to 10 µg/mL after 30 min incubation at 37 °C. No cytotoxicity was associated with incubation at these concentrations of biotinylated PIM derivative **3**, although higher concentration (20 µg/mL) yielded some cell mortality, as detected by 7-AAD labeling (not shown). The kinetics of the association of biotinylated PIM to macrophages (Figure 5C) revealed a strong binding already at 1 min of incubation. PIM–biotin labeling was less pronounced at 10 and 30 min, which might be due to desorption or internalization. Thus, the PIM–biotin conjugate binds macrophages with a rapid kinetics.

Confocal microscopy was then used to localize the biotinylated PIM derivative at the subcellular level. Macrophages incubated with PIM–biotin conjugate **3** were revealed with a streptavidin–Alexa 532 fluorescent conjugate (Figure 7). The clear membrane labeling indicated that under these conditions PIM conjugates associated preferentially with the membrane on macrophages.

In conclusion, we demonstrated here the following:

- (1) A biotin-aza-PIM₂ conjugate (compound **3**) and a fluorescent tetramethylrhodamine-aza-PIM₂ conjugate (compound **4**) could be efficiently constructed by chemical synthesis by taking advantage of the reactive function present in the piperidine ring of the aza-PIM₂ mimic (as in **1A**), thus overcoming the difficult problem of labeling PIMs based on an intact, natural inositol scaffold.
- (2) The introduction of a functionalized spacer of the acylaminocaproyl (AC) type onto the piperidine ring of the PIM₂ mimic does not alter the immuno-modulating activity of the parent compound.
- (3) The conjugation of biotin to the aza-PIM₂ analogue by way of the AC spacer does not hamper its biological activity: this conjugate does not exhibit cytotoxicity at the concentrations used for the assays and it retains the

ability to inhibit LPS-induced production of pro-inflammatory cytokines such as TNFα and IL12p40.

- (4) In contrast with **3**, the aza-PIM₂ mimic carrying a fluorescent label, compound **4**, exhibits significant cytotoxicity which will limit its use in further biological studies.
- (5) In addition, our first experiments with biotin-aza-PIM₂ conjugate **3** clearly showed that PIMs rapidly associate with macrophage cell membrane. This compound will be an invaluable tool to further analyze the mode of action of the PIMs. Among the many questions that are amenable to study with this conjugate or related molecules are the colocalization with cell-surface receptors, co-receptors, co-stimulatory molecules, or with molecules associated with their downstream pathways, the kinetics of internalization, and cellular compartmentalization.

■ ADDITIONAL NOTE

^aBecause of the presence of slow-exchanging amide rotamers, of *P**-diastereoisomers, and of the nonequivalence of the sugar moieties, the NMR spectrum of **12** is highly complex, exhibiting in particular eight anomeric signals of nearly equal intensities. The ¹H NMR spectrum of precursor **10** in DMSO was recorded at 90 °C; at this temperature, the spectrum showed clearly a single species present with signals of two non-equivalent mannosyl units.
