## ARTICLE INFO

#### Abstract

A series of A-ring-modified lamellarin N analogues were designed, synthesized, and evaluated as potential noncovalent inhibitors of the EGFR T790M/L858R mutant, a causal factor in the drug-resistant non-small cell lung cancer. Several water-soluble ammonium- or guanidiniumtethered analogues exhibited good kinase inhibitory activities. The most promising analogue, 14f, displayed an excellent inhibitory profile against the $\mathrm{T} 790 \mathrm{M} / \mathrm{L} 858 \mathrm{R}$ mutant $\left[\mathrm{IC}_{50}(\mathrm{WT})=\right.$ $\left.31.8 \mathrm{nM} ; \mathrm{IC}_{50}(\mathrm{~T} 790 \mathrm{M} / \mathrm{L} 858 \mathrm{R})=8.9 \mathrm{nM}\right]$. The effects of A-ring-substituents on activity were rationalized by docking studies.

## 1. Introduction

Epidermal growth factor receptor (EGFR) is a transmembrane protein involved in multiple signal transduction pathways associated with cell proliferation, survival, and migration. ${ }^{1,2}$ Upon EGF binding to the extracellular receptor domain, EGFR monomers dimerize and activate their intracellular tyrosine kinase domains to initiate signaling. ${ }^{3}$ Malignant mutations in the kinase domain of wild-type EGFR (EGFR WT) lead to constitutive activation, without ligand binding. ${ }^{4,5}$ The most frequent mutations are the substitution of Leu858 in the activation loop with arginine (L858R) and an exon 19 deletion. These activating mutations cause a subset of non-small cell lung cancer (NSCLC). To treat this type of NSCLC, many small molecule tyrosine kinase inhibitors (TKIs) have been developed, two of which (gefitinib ${ }^{6}$ and erlotinib ${ }^{7}$ ) were approved by the US Food and Drug Administration (FDA) in 2002 and 2004, respectively (Fig. 1). These drugs have a common 4anilinoquinazoline motif and are highly effective for the treatment of NSCLC harboring activating EGFR mutations. Unfortunately, the efficacy of these drugs is limited by the emergence of resistance via the mutation of Thr790, referred to as the gatekeeper residue, to methionine (T790M), ${ }^{8}$ which leads

[^0]to an increased affinity to ATP and resistance to first-generation EGFR-TKIs. ${ }^{9}$ To overcome this issue, 4-anilinoquinazolinebased irreversible (covalent) inhibitors, such as afatinib (BIBW2992), ${ }^{10}$ have been developed. These second-generation inhibitors possess an appropriate Michael acceptor on the quinazoline ring to form a covalent bond with the SH group of Cys797. Although afatinib was approved in 2013, its use for the treatment of NSCLC harboring EGFR T790M/L858R is limited by its dose-limiting toxicity associated with the concurrent inhibition of EGFR WT. ${ }^{11}$

afatinib (BIBW2992)

,

Fig. 1. Approved EGFR-TKIs for the treatment of NSCLC.

More recently, pyrimidine-based irreversible inhibitors, such as WZ4002, ${ }^{12}$ rociletinib (CO-1686), ${ }^{13}$ and osimertinib (AZD9291), ${ }^{14}$ have been developed. These third-generation TKIs exhibit much a higher affinity to EGFR T790M/L858R than to EGFR WT and show promising responses to resistant NSCLC in clinical evaluations. The FDA approved osimertinib for the treatment of patients with EGFR T790M mutationpositive metastatic NSCLC in 2015. However, a new mutation at Cys797, the site of covalent binding, to serine (C797S) leads to resistance to osimertinib and related irreversible inhibitors. ${ }^{15}$ It has been reported that the EGFR T790M/C797S/L858R triple mutation causes resistance to all currently available EGFR-TKIs, except for combined therapy with the anti-EGFR antibody cetuximab. ${ }^{16-18}$ Thus, new EGFR-TKIs that do not rely on covalent bond formation with Cys797 for potency are needed. ${ }^{19-21}$

Lamellarins are DOPA-derived marine natural products with a unique polyaromatic structure (Fig. 2). ${ }^{22,23}$ Some lamellarins exhibit potent cytotoxicity against cancer cell lines, including multi-drug resistant phenotype. ${ }^{24-27}$ In 2003, Bailly reported that lamellarin D (1) is a potent inhibitor of DNA topoisomerase I. ${ }^{28}$ There is a strong correlation between cytotoxicity and topoisomerase I inhibition, suggesting that topoisomerase I is a major molecular target of $\mathbf{1}$ in cancer cells. ${ }^{29}$ In 2008, Meijer reported that lamellarin N (2) strongly inhibits several protein kinases related to cancer and neurodegenerative diseases, such as CDKs and GSK-3 $\alpha / \beta$, ${ }^{30}$ but has low selectivity. Recently, we investigated the effects of the axial chirality of 2 on the selectivity of kinase inhibtion. ${ }^{31}$ Although 2 could not be resolved at room temperature due to the relatively low energy barrier for rotation around the C1-C11 single bond ( $83-87 \mathrm{~kJ} / \mathrm{mol}$ ), ${ }^{32} 16$ methyllamellarin $\mathrm{N}(\mathbf{3})$ with hindered rotation was successfully resolved by HPLC over the chiral stationary phase to yield thermally stable atropisomers. ${ }^{31}$ Interestingly, these isomers differed in selectivity to 8 protein kinases (CDK1/cyclin B, CDK2/cyclin A, CDK5/p25, GSK-3 $\alpha / \beta$, PIM1, DYRK1A, CLK3, and CK1). Although (aR)-3 showed potent, but nonselective inhibition of all kinases, except for CK1, (aS)-3 selectively inhibited GSK-3 $\alpha / \beta$, PIM1, and DYRK1A. In contrast

Fig. 2. Biologically active lamellarins.
to parental 2, both $(\mathrm{a} R)$ - and $(\mathrm{a} S)-\mathbf{3}$ showed no inhibition of topoisomerase I. These results suggested that the lamellarin scaffold is a unique structural motif that can be used to design selective inhibitors of protein kinases. In this study, we generated potent noncovalent inhibitors of the EGFR T790M/L858R mutant based on 2.

## 2. Results and discussion

### 2.1. Structure-based drug design

We initially investigated the binding mode of $\mathbf{2}$ in the EGFR T790M/L858R kinase domain by docking simulations using published X-ray crystallographic data for the T790M/L858R/V948R kinase-gefitinib complex ${ }^{33}$ [PDB ID: 4I22]. An additional V948R mutation was introduced to prevent dimerization of the T790M/L858R kinase during crystallization. This mutation had essentially no influence on the structure or activity of the $7790 \mathrm{M} / \mathrm{L} 858 \mathrm{R}$ kinase beyond the changes observed in a monomeric state in solution. ${ }^{33}$ Gefitinib in the ATP-binding pocket of the kinase was replaced with 2 and the resulting complex was minimized using the MOE program. ${ }^{34}$ The model with the highest docking score is depicted in Fig. 3. In this model, the planar pentacyclic core (ABCDE-ring) of 2 occupied the ATP-binding pocket in such a way that the A-ring was directed to the solvent channel (entrance region) and the E-ring was oriented to the specificity (back) pocket. The F-ring perpendicularly connected to the pentacyclic core was situated at the ribose-binding site. The lactone carbonyl $(\mathrm{C}=\mathrm{O})$ of the B -ring formed a hydrogen bond with the NH of Met793 located in the hinge region. The phenolic OH at C 8 also formed a hydrogen bond with the side chain carboxylate of Asp855 in the conserved catalytic salt bridge (Lys745-Asp855). Another phenolic OH at C13 of the F-ring was directed downward and formed an additional hydrogen bond with $\mathrm{C}=\mathrm{O}$ of Arg 841 in the A-loop. Overall, the binding mode of 2 in the EGFR T790M/L858R kinase domain was similar to the previously reported binding modes of $\mathbf{2}$ in CDK 2 or GSK-3ß. ${ }^{31}$

Further inspection of this model revealed the presence of a negatively charged small pocket at the edge of the entrance region. This pocket was surrounded by stem chain $\mathrm{C}=\mathrm{O}$ of Phe795 and side chain carboxylates of both Asp800 and Glu804 [Fig. 3 (c)]. Since the oxygen functionalities ( $20-\mathrm{OH}$ and $21-$ OMe ) at the A-ring of $\mathbf{2}$ were directed to this pocket, we thought that positively charged ammonium group(s) tethered to these oxygens may increase the activity of $\mathbf{2}$ by ionic and/or hydrogen bonding interactions. Examples of the designed inhibitors are illustrated in Fig. 4.

### 2.2. Synthesis

We recently developed a modular synthesis of lamellarins by the regioselective assembly of 3,4,5-differentially arylated pyrrole-2-carboxylates. ${ }^{35,36}$ In the present study, we improved this method to produce diverse A-ring-modified lamellarin N analogues by preassembling the common tricyclic intermediate 7 (CDEF-ring of the lamellarin core), followed by Suzuki-Miyaura coupling with a variety of 2-(methoxymethoxy)arylboronic acids $\mathbf{8 a - g}$ corresponding to the A-ring (Scheme 1 ).

Readily available $N$-Boc-2,5-dibromopyrrole (4) was converted to a known tetra-substituted pyrrole $\mathbf{5}$ in 6 steps using procedures established in our laboratories. ${ }^{35}$ Compound 5 was alkylated at the pyrrole-nitrogen with bromoacetaldehyde dimethyl acetal in the presence of $\mathrm{Cs}_{2} \mathrm{CO}_{3}$ to give 6 (91\% yield). Subsequent trifluoromethanesulfonic acid (TfOH)-catalyzed cyclization ${ }^{35}$ of 6 to produce a key tricyclic intermediate 7 was difficult due to the unexpected partial elimination of an $O$ -isopropyl-protecting group in the highly acidic conditions. This unfavorable overreaction could be avoided by the slow addition of a catalytic amount ( 0.1 equiv) of TfOH as a diluted dichloromethane (DCM) solution (condition $b$ in Scheme 1). Under carefully controlled conditions, intact 7 was isolated in $88 \%$ yield. We later found that this cyclization could be performed more conveniently using trimethylsilyl trifluoromethanesulfonate (TMSOTf) ( 0.5 equiv) as a Lewis acid catalyst $^{37}$ (condition cin Scheme 1). Subsequent Suzuki-Miyaura coupling of 7 with a range of 2-(methoxymethoxy)arylboronic acids $\mathbf{8 a - g}$ gave $\mathbf{9 a - g}$ in good yields using $\operatorname{Pd}(\mathrm{dba})_{2}-\mathrm{dppf}^{35}$ as a catalyst. The coupling products were lactonized directly to $O$ protected lamellarins $\mathbf{1 0 a}-\mathbf{g}$ by heating in methanol in the presence of $p-\mathrm{TsOH} \cdot \mathrm{H}_{2} \mathrm{O}$.

Next, deprotection of $O$-isopropyl and/or $O$-benzyl groups of 10a-e was performed. Both protecting groups were simultaneously removed by treatment with $\mathrm{BCl}_{3}{ }^{38}$ in DCM to
give fully deprotected lamellarins 11a-e in good yields (Scheme 2). Compound 11d was identical to lamellarin N based on a spectroscopic comparison with an authentic sample. ${ }^{35,38}$ An attempted deprotection of $\mathbf{1 0 g}(\mathrm{X}=\mathrm{Y}=\mathrm{OBn})$ with $\mathrm{BCl}_{3}$ gave only an intractable material.

Scheme 2. Deprotection of $O-i-\mathrm{Pr}$ and $O-\mathrm{Bn}$ groups of 10a-e. Reagents and conditions: (a) $\mathrm{BCl}_{3}, \mathrm{DCM}$, approximately $-78^{\circ} \mathrm{C}$ to room temperature or $78{ }^{\circ} \mathrm{C}$ to $-40^{\circ} \mathrm{C}$ (11a: $97 \%$, 11b: $96 \%$, 11c: $70 \%$. 11d: $71 \%$, 11e: $90 \%$ ).

The $O$-benzyl groups of $\mathbf{1 0 d}-\mathbf{g}$ were selectively removed by hydrogenolysis ${ }^{39}$ over $\mathrm{Pd}-\mathrm{C}$ using $\mathrm{HCO}_{2} \mathrm{NH}_{4}$ as a hydrogen source to give 12a-d in excellent yields (Scheme 3). When the solubility of the substrate was poor (e.g., $\mathbf{1 0 g}$ ) in the solvent $(\mathrm{AcOEt} / \mathrm{EtOH}=1: 1)$, partial hydrogenation of the 5,6unsaturated bond at the D-ring was observed. However, this unfavorable overreaction was avoided by carrying out the reaction in a sufficient amount of the solvent for a short period of time ( $<1 \mathrm{~h}$ ). Acidolysis ${ }^{40}$ could also be used for selective debenzylation. For example, treatment of $\mathbf{1 0 g}(X=Y=O B n)$ with trifluoroacetic acid in the presence of pentamethylbenzene ${ }^{41}$ gave 12d $(\mathrm{X}=\mathrm{Y}=\mathrm{OH})$ in $87 \%$ yield.

Scheme 3. Selective deprotection of the $O$-Bn group of 10d-g. Reagents and conditions: (a) $\mathrm{HCO}_{2} \mathrm{NH}_{4}, 10 \% \mathrm{Pd}-\mathrm{C}, \mathrm{AcOEt} / \mathrm{EtOH}=1: 1$, reflux, $0.5-1 \mathrm{~h}$ (12a: $93 \%$, 12b: $95 \%$, 12c: $96 \%$, 12d: $93 \%$ ).

Scheme 1. Synthesis of $O$-protected lamellarins 10a-g. Reagents and conditions: (a) $\mathrm{BrCH}_{2} \mathrm{CH}(\mathrm{OMe})_{2}, \mathrm{Cs}_{2} \mathrm{CO}_{3}, \mathrm{DMF}, 110{ }^{\circ} \mathrm{C}, 16 \mathrm{~h}(91 \%)$; (b) $\mathrm{TfOH}(0.1$ equiv), DCM, $0^{\circ} \mathrm{C}, 2 \mathrm{~h}(88 \%)$; (c) TMSOTf ( 0.5 equiv), DCM, rt, $1.5 \mathrm{~h}\left(91 \%\right.$ ); (d) $\mathrm{Pd}(\mathrm{dba})_{2}(10 \mathrm{~mol} \%)$, dppf ( $10 \mathrm{~mol} \%$ ), 8 ( 1.5 equiv), $\mathrm{Na}_{2} \mathrm{CO}_{3}$ ( 6.6 equiv ), DME, water, $85^{\circ} \mathrm{C}$ in a sealed tube or reflux, $24 \mathrm{~h}\left(\mathbf{9 a}: 94 \%, 9 \mathbf{b}: 90 \%, 9 \mathrm{c}: 94 \%, \mathbf{9 d}: 77 \%, 9 \mathrm{e}: 97 \%, 9 \mathrm{f}: 87 \%, 9 \mathrm{~g}:\right.$ quant.); (e) $p-\mathrm{TsOH} \cdot \mathrm{H}_{2} \mathrm{O}(4.0 \mathrm{equiv}), \mathrm{MeOH}, 65$ ${ }^{\circ} \mathrm{C}$ in a sealed tube or reflux, $18 \mathrm{~h}(\mathbf{1 0 a}: 98 \%, \mathbf{1 0 b}: 96 \%, \mathbf{1 0 c}: 92 \%, 10 \mathrm{~d}: 93 \%, \mathbf{1 0 e}: 90 \%, \mathbf{1 0 f}: 88 \%, \mathbf{1 0 g}: 84 \%)$.

Next, selectively debenzylated lamellarins 12a-d were converted to a series of ammonium-tethered analogues 14a-g in two additional steps (Scheme 4). Thus, 12a-d were reacted with an appropriate alkylating agent, such as 2-(dimethylamino)ethyl chloride, 3-(dimethylamino)propyl chloride, and 4-(3chloropropyl)morpholine, in acetone in the presence of $\mathrm{K}_{2} \mathrm{CO}_{3}$ to
give $\mathbf{1 3 a - g}$ in good yields. The $O$-isopropyl protecting groups of 13a-g were cleanly removed by treatment with $\mathrm{AlCl}_{3}{ }^{42}$ at room temperature, without affecting $O$-aminoalkyl groups. The deprotected lamellarins were purified using a Sephadex column and isolated as trifluoroacetates 14a-f or methanesulfonate 14g. The trifluoroacetate corresponding to $\mathbf{1 4 g}$ was not obtained

Scheme 4. Synthesis of ammonium-tethered lamellarin N analogues 14a-g. Reagents and conditions: (a) $\mathrm{ClCH}_{2} \mathrm{CH}_{2} \mathrm{NMe}_{2} \cdot \mathrm{HCl}_{1}, \mathrm{~K}_{2} \mathrm{CO}_{3}$, acetone, reflux (13a: $88 \%$, 13c: $82 \%$, 13e: $54 \%$ ); (b) $\mathrm{ClCH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{NMe}_{2} \cdot \mathrm{HCl}, \mathrm{K}_{2} \mathrm{CO}_{3}$, acetone, reflux (13b: $70 \%$, 13d: $34 \%$, 13f: $71 \%$ ); (c) 4-(3-chloropropyl)morpholine, NaI , $\mathrm{K}_{2} \mathrm{CO}_{3}$, acetone, reflux (13g: $97 \%$ ); (d) (1) $\mathrm{AlCl}_{3}, \mathrm{DCM}$, rt, (2) TFA (14a: $97 \%, \mathbf{1 4 b}: 82 \%, \mathbf{1 4 c}: 88 \%, \mathbf{1 4 d}: 98 \%, \mathbf{1 4 e}: 93 \%, \mathbf{1 4 f}:$ quant); (e) (1) $\mathrm{AlCl}, \mathrm{DCM}, \mathrm{rt}$, (2) $\mathbf{M s O H}(\mathbf{1 4 g}: 86 \%)$.

Scheme 5. Synthesis of guanidinium-tethered lamellarin N analogues 18a, b. Reagents and conditions: (a) $\mathrm{BocNHCH}_{2} \mathrm{CH}_{2} \mathrm{OH}$ (1.5 equiv), DIAD (1.5 equiv), $\mathrm{PPh}_{3}$ ( 1.5 equiv), THF, rt (15a: $90 \%$ ); (b) $\mathrm{BocNHCH} \mathrm{N}_{2} \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{OH}$ ( 1.5 equiv), DIAD ( 1.5 equiv), $\mathrm{PPh}_{3}$ ( 1.5 equiv), THF, rt ( $\mathbf{1 5 b}$ : $87 \%$ ); (c) TFA (16a: quant, 16b: $96 \%$ ); (d) $N, N^{\prime}$-bis(Boc)-1 $H$-pyrazole-1-carboxamidine ( 2.0 equiv), $\mathrm{Et}_{3} \mathrm{~N}$ ( 2.0 equiv), THF, rt, (17a: $87 \%, \mathbf{1 7 b}: 75 \%$ ); (e) (1) $\mathrm{AlCl}_{3}$ ( 10 equiv), $\mathrm{DCM}, \mathrm{rt}, 2 \mathrm{~d}$ (2) TFA (18a: $46 \%$, 18b: $81 \%$ ).
owing to the lower basicity of morpholino nitrogen (ca. 1/1000 of common tertiary amines). In contrast to the highly lipophilic parental lamellarins, ${ }^{40}$ these ammonium salts were highly soluble in water. For example, the estimated solubilities of $\mathbf{1 4 b}$ and $\mathbf{1 4 f}$ in water were $19 \mathrm{mg} / \mathrm{mL}$ and $41 \mathrm{mg} / \mathrm{mL}$, respectively, as determined by a HPLC method (Fig. 5). ${ }^{43}$

Water solubility: $19 \mathrm{mg} / \mathrm{mL}$

Water solubility: $\mathbf{4 1 \mathrm { mg } / \mathrm { mL }}$

Fig. 5. Solubilities of lamellarin N (2) and its ammonium-tethered analogues 14b and 14f.

The guanidinium group can recognize carboxylate anions by exceptionally potent ionic and hydrogen bonding interactions. ${ }^{44}$ We predicted that the guanidinium group at the A-ring side chain could interact with Asp800 or Glu804 more strongly than the simple ammonium groups. Thus, we synthesized guanidiniumtethered analogues 18a and 18b from 12a (Scheme 5). The

Mitsunobu reaction of 12a with tert-butyl N -(2hydroxyethyl)carbamate produced the $O$-alkylated compound 15a in good yield. After deprotection of the Boc group by TFA, the resulting 16a was reacted with $N, N^{\prime}$-bis $(t e r t-$ butoxycarbonyl)- 1 H -pyrazole-1-carboxamidine ${ }^{45,46}$ to give $\mathbf{1 7 a}$. Treatment of this compound with $\mathrm{AlCl}_{3}$ in DCM caused the simultaneous deprotection of both $i-\mathrm{Pr}$ and Boc groups. The resulting guanidinium compound was isolated as a TFA salt 18a in good yield. Another guanidinium derivative 18b with a propylene linker was prepared in a similar manner using tertbutyl $N$-(3-hydroxypropyl)carbamate as an alkylating agent. The guanidinium salts 18a and 18b were soluble in water, like the ammonium salts 14a-g.

### 2.3. In vitro kinase assay and structure-activity relationships

Kinase inhibitory activities of the synthetic lamellarins 11b, d, $\mathbf{e , ~ 1 4 a - g , ~ a n d ~ 1 8 a , ~ b}$ were evaluated by enzyme-linked immunosorbent assays using the recombinant kinase domains of EGFR WT and the T790M/L858R mutant. ${ }^{47}$ Approved EGFRTKIs, gefitinib and afatinib, were used as positive controls. Halfmaximal inhibitory concentrations $\left(\mathrm{IC}_{50}\right)$ of the tested compounds are shown in Table 1. Lamellarin N (11d) and its 20-O-methyl derivative 11b were inactive at concentrations of lower than 1000 nM (entries 1, 2). Interestingly, compound 11e, in which $20-\mathrm{OH}$ and $21-\mathrm{OMe}$ of $\mathbf{1 1 d}$ is simply replaced, exhibited moderate activity (entry 3 ). These results indicate that $21-\mathrm{OH}$ (not $20-\mathrm{OH}$ ) is an important structural unit to potentiate the kinase inhibitory activity. The inhibitor $\mathbf{1 4 a}$ with a 2 -( $N, N$-dimethylamino)ethoxy group at C20 showed modest activity (entry 4). Homologous 14b bearing a 3 -( $N, N$-dimethylamino) propoxy group at the same position exhibited higher activity (entry 5). Thus the 1,3propylene linker seems to be better than the ethylene linker to connect the positively charged ammonium group to the lamellarin core. Transposition of the 20- and 21-substituents (X and Y ) of 14a decreased the activity (entry 6). Compound 14d with 21-OH and 20-[3-(N,N-dimethylamino)propoxy] had greater

Table 1
Inhibitory activities of A-ring-modified lamellarin N analogues toward EGFR WT and T790M/L858R kinase domains.

activity than that of $\mathbf{1 4 b}$ (entry 7), indicating again that $21-\mathrm{OH}$ potentiates the activity of lamellarins. However, lamellarins with 21-OH selectively inhibited WT, rather than the T790M/L858R mutant (entries 3, 7). The activities of 20, 21-bis $(N, N-$ dimethylamino)alkyloxy lamellarins $\mathbf{1 4 e}$ and $\mathbf{1 4 f}$ were higher than those of the corresponding monoalkyloxy lamellarins 14a and 14b (entries 8, 9). In particular, $\mathbf{1 4 f}$ showed potent and selective activity toward the T790M/L858R mutant at a low nM concentration (entry 9). The activity was comparable to that of the covalent inhibitor afatinib (entry 14). Of interest, the less basic morpholino derivative $\mathbf{1 4 g}$ was inactive at concentration of below 1000 nM (entry 10). The activities of the guanidinium
derivatives were sensitive to the length of the linker. Compound 18a with the ethylene linker was inactive, whereas compound 18b bearing the 1,3-propylene linker was quite active (entries 11, 12).

### 2.4. Docking analysis

To rationalize the effects of A-ring-substituents X and Y on kinase inhibitory activity, docking simulations of the active compounds $\mathbf{1 4 b}, \mathbf{1 4 d}, \mathbf{1 4 f}$, and $\mathbf{1 8 b}$ in the ATP-binding pocket of EGFR T790M/L858R/V948R were performed using the protocol described in section 2.1. Plausible binding modes are represented

Fig. 6. Plausible binding modes of $\mathbf{1 4 b}, \mathbf{1 4 d}, \mathbf{1 4 f}$, and $\mathbf{1 8 b}$ in the ATP-binding pocket of EGFR T790M/L858R/V948R. (A) Side view from the entrance region; (B) side-view from the entrance region (the region surrounding the ATP-binding pocket is shown by an electrostatic potential map); (C) top view from the $N$ terminal lobe (floor of the ATP-binding pocket is shown by an electrostatic potential map).
in Fig. 6. The orientation of the lamellarin core of each compound was quite similar to that of lamellarin N shown in Fig. 3. Each 3-( $N, N$-dimethylamino)propoxy group at the 20 -position of $\mathbf{1 4 b}, \mathbf{1 4 d}$, and $\mathbf{1 4 f}$ was nicely embedded in the negatively charged small pocket in the entrance region and the ammonium group makes hydrogen bonding and/or ionic interactions with the side chain carboxylate of Glu804 or stem chain carbonyl of Phe795. The 21-OH of 14d and 21-[3-(N,Ndimethylamino)propoxy] group of $\mathbf{1 4 f}$ can form additional hydrogen bonds with Asp800. This may explain the higher activities of $\mathbf{1 4 d}$ and $\mathbf{1 4 f}$ compared to $\mathbf{1 4 b}$. The high activity of 18b may be rationalized by unique dual hydrogen bonding interactions of the guanidinium moiety with the carboxylates of Asp800 and Glu804.

## 3. Conclusion

Various A-ring-modified lamellarin N analogues were designed, synthesized, and evaluated as non-covalent inhibitors of the EGFR T790M/L858R mutant. Several water-soluble ammonium- and guanidinium-tethered analogues, such as $\mathbf{1 4 b}, \mathbf{d}$, $\mathbf{e}, \mathbf{f}$, and $\mathbf{1 8 b}$, exhibited good inhibitory activity against the kinases. In particular, $\mathbf{1 4 f}$ showed a low nM IC 50 towards the T790M/L858R mutant. Docking studies suggested that hydrogen bonding and/or ionic interactions of A-ring-substituent(s) with Phe795, Asp800, and Asp804 are major determinants of the increased activities of these analogues. Further biological evaluations of the most promising analogue, $\mathbf{1 4 f}$, are in progress in our laboratories.

## 4. Experimental section

### 4.1. Synthesis-general

Melting points were determined with a Yanagimoto micro melting point apparatus and are uncorrected. IR spectra were obtained with a Thermo Nicolet Nexus 670 NT FT-IR instrument and are reported in terms of absorption frequency $\left(\mathrm{cm}^{-1}\right)$. NMR spectra were recorded on a JEOL JNM-AL400 instrument (400 MHz for ${ }^{1} \mathrm{H}$ and 100 MHz for ${ }^{13} \mathrm{C}$ ) or a Varian NMR System 500PS SN instrument ( 500 MHz for ${ }^{1} \mathrm{H}$ and 126 MHz for ${ }^{13} \mathrm{C}$ ). Chemical shifts for ${ }^{1} \mathrm{H}$ NMR are expressed in parts per million (ppm) relative to the following internal standards: $\mathrm{CDCl}_{3}$ (tetramethylsilane, $\delta 0.0 \mathrm{ppm}$ ); DMSO- $d_{6}$ (DMSO, $\delta 2.50 \mathrm{ppm}$ ). Data for ${ }^{1} \mathrm{H}$ NMR spectra are reported as follows: chemical shift ( $\delta \mathrm{ppm}$ ), multiplicity $(\mathrm{s}=$ singlet, $\mathrm{d}=$ doublet, $\mathrm{dd}=$ double doublet, $\mathrm{t}=$ triplet, sext $=$ sextet, sep $=$ septet, $\mathrm{m}=$ multiplet, br s $=$ broad singlet), coupling constant (Hz), and integration. Chemical shifts for ${ }^{13} \mathrm{C}$ NMR are expressed in ppm relative to the following internal standards: $\mathrm{CDCl}_{3}$ (tetramethylsilane, $\delta 0.0$ $\mathrm{ppm})$; DMSO- $d_{6}\left(\right.$ DMSO- $\left.d_{6}, \delta 39.52 \mathrm{ppm}\right) .{ }^{13} \mathrm{C}$ NMR data are reported in terms of chemical shift. High-resolution mass spectra (HRMS) were recorded on a JEOL JMS-T100TD (direct analysis in real-time mass spectrometry, DARTMS) instrument or a JEOL JMS-700N (fast atom bombardment mass spectrometry, FABMS or electron ionized mass spectrometry, EIMS) instrument. Column chromatography was conducted using silica gel 60 N , $63-210 \mu \mathrm{~m}$ (Kanto Chemical Co., Inc.) or Chromatorex NHDM1020 (Fuji Silysia Chemical Ltd.). Flash chromatography was conducted using silica gel 60N, 40-50 $\mu \mathrm{m}$ (Kanto Chemical Co., Inc.).

### 4.2. Synthesis of A-ring-modified lamellarin $N$ analogues

### 4.2.1. Synthesis of tricyclic intermediate 7

4.2.1.1. Methyl 3-bromo-1-(2,2-dimethoxyethyl)-4-(3-isopropoxy-4-methoxyphenyl)-5-(4-isopropoxy-3-methoxyphenyl)-1H-pyrrole-2-carboxylate (6)

Under an argon atmosphere, a mixture of $5(2.66 \mathrm{~g}, 5.00$ mmol ), 2-bromo-1,1-dimethoxyethane ( $3.72 \mathrm{~mL}, 31.5 \mathrm{mmol}$ ), and $\mathrm{Cs}_{2} \mathrm{CO}_{3}(11.7 \mathrm{~g}, 35.8 \mathrm{mmol})$ in DMF $(60 \mathrm{~mL})$ was stirred for 16 h at $110{ }^{\circ} \mathrm{C}$. After cooling to room temperature, the mixture was diluted with water and and the products were extracted with a mixed solvent of hexane-EtOAc (1:1). The extract was washed with water and brine, dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$, and evaporated. The residue was purified by flash chromatography over silica gel 60 N (hexane-ethyl acetate $=3: 1$ ) to give $\mathbf{6}$ as a colorless semisolid ( $2.83 \mathrm{~g}, 91 \%$ ). IR (KBr): 1698, 1467, 1441, 1255, 1136, 1093 $\mathrm{cm}^{-1} .{ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta 1.21(\mathrm{~d}, J=6.1 \mathrm{~Hz}, 6 \mathrm{H})$, $1.35(\mathrm{~d}, J=6.1 \mathrm{~Hz}, 6 \mathrm{H}), 3.23(\mathrm{~s}, 6 \mathrm{H}), 3.67(\mathrm{~s}, 3 \mathrm{H}), 3.81(\mathrm{~s}, 3 \mathrm{H})$, 3.93 (s, 3H), 4.27 (sep, $J=6.1 \mathrm{~Hz}, 1 \mathrm{H}), 4.41-4.46(\mathrm{~m}, 3 \mathrm{H}), 4.50$ (sep, $J=6.1 \mathrm{~Hz}, 1 \mathrm{H}$ ), $6.66(\mathrm{~s}, 1 \mathrm{H}), 6.72-6.76$ (m, 3H), $6.76(\mathrm{~d}, J$ $=1.7 \mathrm{~Hz}, 1 \mathrm{H}), 6.79(\mathrm{~d}, J=8.3 \mathrm{~Hz}, 1 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR $(100 \mathrm{MHz}$, $\left.\mathrm{CDCl}_{3}\right): \delta 21.9,22.0,48.4,51.4,54.9,55.8,55.9,71.0,71.1$, 104.2, 106.4, 111.1, 114.5, 115.3, 118.3, 120.3, 123.0, 123.3, 124.0, 125.0, 126.0, 138.8, 146.3, 147.5, 149.0, 149.7, 161.6. HRDARTMS m/z. Calcd for $\mathrm{C}_{30} \mathrm{H}_{38} \mathrm{BrNO}_{8}\left(\mathrm{M}^{+}\right): 619.17808$. Found: 619.17815.
4.2.1.2. Methyl 2-bromo-8-isopropoxy-1-(3-isopropoxy-4-methoxyphenyl)-9-methoxy-pyrrolo[2,1-a]isoquinoline-3-
carboxylate (7)
Method 1: Under an argon atmosphere, to a solution of 6 (255 $\mathrm{mg}, 0.411 \mathrm{mmol})$ in $\mathrm{DCM}(8.0 \mathrm{~mL})$ was added a DCM solution of $\mathrm{TfOH}(74.5 \mathrm{mM}, 550 \mu \mathrm{~L}, 41.1 \mu \mathrm{~mol})$ at $0^{\circ} \mathrm{C}$. After stirring for 2 h at $0{ }^{\circ} \mathrm{C}, \mathrm{Na}_{2} \mathrm{CO}_{3}(50 \mathrm{mg})$ and $\mathrm{MgSO}_{4}(50 \mathrm{mg})$ was added to the mixture. The suspension was allowed to warm to room temperature and then stirred for an additional 0.5 h . The mixture was passed through a filter paper. The filtrate was evaporated and the residue was purified by column chromatography over silica gel 60 N (hexane-ethyl acetate $=3: 1$ ) to give 7 as a colorless solid ( $202 \mathrm{mg}, 88 \%$ ).

Method 2: Under an argon atmosphere, to a solution of 6 (1.84 $\mathrm{g}, 2.97 \mathrm{mmol})$ in DCM $(110 \mathrm{~mL})$ was added TMSOTf $(270 \mu \mathrm{~L}$, 1.49 mmol ) at $0{ }^{\circ} \mathrm{C}$. After stirring for 1.5 h at $0{ }^{\circ} \mathrm{C}$, a saturated aqueous $\mathrm{NaHCO}_{3}$ was added to the mixture. The mixture was allowed to warm to room temperature and stirred for an additional 0.5 h . The products were extracted with DCM and the extract was washed with water and brine, dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$, and evaporated. The residue was purified by flash chromatography over silica gel 60 N (hexane-ethyl acetate $=4: 1$ ) to give 7 as a colorless solid ( $1.50 \mathrm{~g}, 91 \%$ ).

Recrystallization from $\mathrm{Et}_{2} \mathrm{O}$-hexane gave a colorless granules. Mp $165-166^{\circ} \mathrm{C} . \mathrm{IR}(\mathrm{KBr}): 1675,1449,1352,1213,1111 \mathrm{~cm}^{-1}$. ${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta 1.35(\mathrm{~d}, J=6.1 \mathrm{~Hz}, 3 \mathrm{H}), 1.38(\mathrm{~d}$, $J=6.1 \mathrm{~Hz}, 3 \mathrm{H}), 1.42(\mathrm{~d}, J=6.1 \mathrm{~Hz}, 6 \mathrm{H}), 3.41(\mathrm{~s}, 3 \mathrm{H}), 3.93(\mathrm{~s}$, $3 \mathrm{H}), 3.98(\mathrm{~s}, 3 \mathrm{H}), 4.53(\mathrm{sep}, J=6.1 \mathrm{~Hz}, 1 \mathrm{H}), 4.66(\mathrm{sep}, J=6.1$ $\mathrm{Hz}, 1 \mathrm{H}), 6.93(\mathrm{~d}, J=7.6 \mathrm{~Hz}, 1 \mathrm{H}), 6.95(\mathrm{~d}, J=1.9 \mathrm{~Hz}, 1 \mathrm{H}), 6.99$ (dd, $J=1.9$ and $8.2 \mathrm{~Hz}, 1 \mathrm{H}), 7.02(\mathrm{~s}, 1 \mathrm{H}), 7.05(\mathrm{~d}, J=8.2 \mathrm{~Hz}$, $1 \mathrm{H}), 7.07(\mathrm{~s}, 1 \mathrm{H}), 9.28(\mathrm{~d}, J=7.6 \mathrm{~Hz}, 1 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( 100 MHz , $\left.\mathrm{CDCl}_{3}\right): \delta 21.9,22.0,22.1,51.2,55.2,56.1,71.1,71.2,105.4$, $110.1,112.1,112.3,112.4,112.4,118.6,118.7,119.3,123.3$, $123.5,124.1,127.8,130.9,147.5,148.0,150.0,150.2,161.6$. HRDARTMS $m / z$. Calcd for $\mathrm{C}_{28} \mathrm{H}_{31} \mathrm{BrNO}_{6}\left[(\mathrm{M}+\mathrm{H})^{+}\right]$: 556.13347. Found: 556.13474.

### 4.2.2. Synthesis of $O$-protected lamellarins 10a-g

4.2.2.1. Methyl 8-isopropoxy-1-(3-isopropoxy-4-methoxyphenyl)-9-methoxy-2-[2-(methoxymethoxy)phenyl]pyrrolo[2,1-aJisoquinoline-3-carboxylate (9a)

Under an argon atmosphere, a mixture of $7(50.0 \mathrm{mg}, 89.9$ $\mu \mathrm{mol}), 8 \mathbf{~ a ~}(24.6 \mathrm{mg}, 0.135 \mathrm{mmol}), \mathrm{Pd}(\mathrm{dba})_{2}(5.2 \mathrm{mg}, 9.0 \mu \mathrm{~mol})$, dppf ( $5.0 \mathrm{mg}, 9.0 \mu \mathrm{~mol}), \mathrm{Na}_{2} \mathrm{CO}_{3}(63.0 \mathrm{mg}, 0.594 \mathrm{mmol})$, DME
$(3.0 \mathrm{~mL})$, and degassed water $(0.2 \mathrm{~mL})$ was heated in a sealed tube at $85{ }^{\circ} \mathrm{C}$ for 24 h . After cooling to room temperature, the mixture was evaporated and the products were extracted with DCM. The extract was washed with water and brine, dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$, and evaporated. The residue was purified by flash chromatography over silica gel 60 N (hexane-ethyl acetate $=4: 1$ ) to give 9a as a pale yellow solid ( 51.8 mg , $94 \%$ ). Recrystallization from DCM-hexane gave a pale yellow needles. Mp 186-187 ${ }^{\circ} \mathrm{C}$. IR (KBr): $1688,1473,1379,1256,1226,1190$, $1114 \mathrm{~cm}^{-1} .{ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta 1.07(\mathrm{~d}, J=6.1 \mathrm{~Hz}$, $1.5 \mathrm{H}), 1.20$ (d, $J=6.1 \mathrm{~Hz}, 1.5 \mathrm{H}$ ), 1.21 (d, $J=6.1 \mathrm{~Hz}, 1.5 \mathrm{H}), 1.27$ (d, $J=6.1 \mathrm{~Hz}, 1.5 \mathrm{H}), 1.42(\mathrm{~d}, J=6.1 \mathrm{~Hz}, 6 \mathrm{H}), 3.30(\mathrm{~s}, 3 \mathrm{H}), 3.42$ (br s, 3H), $3.59(\mathrm{~s}, 3 \mathrm{H}), 3.81(\mathrm{~s}, 1.5 \mathrm{H}), 3.82(\mathrm{~s}, 1.5 \mathrm{H}), 4.25$ (sep, J $=6.1 \mathrm{~Hz}, 0.5 \mathrm{H}$ ), 4.33 ( $\mathrm{sep}, J=6.1 \mathrm{~Hz}, 0.5 \mathrm{H}), 4.66(\mathrm{sep}, J=6.1$ $\mathrm{Hz}, 1 \mathrm{H}), 4.86(\mathrm{~d}, J=6.9 \mathrm{~Hz}, 0.5 \mathrm{H}), 4.96(\mathrm{~d}, J=6.9 \mathrm{~Hz}, 0.5 \mathrm{H})$, $4.99(\mathrm{~d}, J=6.9 \mathrm{~Hz}, 0.5 \mathrm{H}), 5.04(\mathrm{~d}, J=6.9 \mathrm{~Hz}, 0.5 \mathrm{H}), 6.75-6.89$ (m, 4H), $6.93(\mathrm{~d}, J=7.6 \mathrm{~Hz}, 1 \mathrm{H}), 6.95-7.01(\mathrm{~m}, 1 \mathrm{H}), 7.04(\mathrm{~s}$, $1 \mathrm{H}), 7.08(\mathrm{~d}, J=8.3 \mathrm{~Hz}, 1 \mathrm{H}), 7.11-7.21(\mathrm{~m}, 2 \mathrm{H}), 9.30(\mathrm{~d}, J=7.6$ $\mathrm{Hz}, 1 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( $100 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta 21.7,21.8,21.9,21.9$, $22.0,22.2,50.7,55.3,55.7,56.0,71.1,71.1,71.2,95.1,105.6$, 110.6, 111.4, 111.7, 112.0, 112.8, 114.6, 117.4, 118.1, 118.2, 118.6, 119.0, 119.4, 119.8, 121.0, 121.2, 123.5, 123.9, 124.1, $124.2,124.4,128.2,128.3,128.4,130.4,131.4,131.8,132.3$, 132.4, 146.9, 147.5, 148.5, 149.3, 149.9, 150.4, 155.6, 162.6. ### 4.2.5.13. Trifluoroacetic acid salt of 2,3-bis[3-(dimethylamino)propoxy]-11-hydroxy-14-(3-hydroxy-4-methoxyphenyl)-12-methoxy-6H-

## [1]benzopyrano[4', 3':4,5]pyrrolo[2,1-a]isoquinolin-6-one (14f)

Under an argon atmosphere, a nitrobenzene solution of $\mathrm{AlCl}_{3}$ $(1.0 \mathrm{M}, 780 \mu \mathrm{~L}, 0.780 \mathrm{mmol})$ was added dropwise to a solution of $\mathbf{1 3 f}(90.2 \mathrm{mg}, 0.122 \mathrm{mmol})$ in $\mathrm{DCM}(19.5 \mathrm{~mL})$ at room temperature. After stirring for 84.5 h at room temperature, a solution of $\mathrm{NaHCO}_{3}(166 \mathrm{mg}, 1.97 \mathrm{mmol})$ and Rochelle salt ( 557 $\mathrm{mg}, 1.97 \mathrm{mmol})$ in water $(3.9 \mathrm{~mL})$ was added. The mixture was stirred for an additional 1 h and then evaporated. The nitrobenzene was removed azeotropically with water under reduced pressure. To the residue was added water and the precipitate was collected by filtration, washed with water, and dried under reduced pressure to give 2,3-bis[3-(dimethylamino)propoxy]-11-hydroxy-14-(3-hydroxy-4-methoxyphenyl)-12-methoxy-6 H -
[1]benzopyrano $\left.4^{\prime}, 3^{\prime}: 4,5\right]$ pyrrolo[2,1- $a$ ]isoquinolin-6-one (14f') as a brown powder ( 80.0 mg , quant). Mp $180-210{ }^{\circ} \mathrm{C}$ (dec) (sealed capillary). IR (KBr): 3410, 1686, 1428, 1283, 1217, 1174 $\mathrm{cm}^{-1} .{ }^{1} \mathrm{H}$ NMR ( 500 MHz, DMSO- $d_{6}$ ): $\delta 1.63-1.70(\mathrm{~m}, 2 \mathrm{H})$, $1.82-1.89(\mathrm{~m}, 2 \mathrm{H}), 2.14(\mathrm{~s}, 6 \mathrm{H}), 2.17(\mathrm{~s}, 6 \mathrm{H}), 2.23-2.30(\mathrm{~m}, 2 \mathrm{H})$, $2.36-2.43(\mathrm{~m}, 2 \mathrm{H}), 3.39(\mathrm{~s}, 3 \mathrm{H}), 3.53-3.60(\mathrm{~m}, 2 \mathrm{H}), 3.88(\mathrm{~s}, 3 \mathrm{H})$, $4.01-4.08(\mathrm{~m}, 2 \mathrm{H}), 6.76(\mathrm{~s}, 1 \mathrm{H}), 6.97-7.02(\mathrm{~m}, 2 \mathrm{H}), 7.07(\mathrm{~s}, 1 \mathrm{H})$, $7.15(\mathrm{~s}, 1 \mathrm{H}), 7.19(\mathrm{~s}, 1 \mathrm{H}), 7.20-7.24(\mathrm{~m}, 2 \mathrm{H}), 8.99(\mathrm{~d}, J=7.3 \mathrm{~Hz}$, $1 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( 126 MHz, DMSO- $d_{6}$ ): $\delta 26.5,26.6,45.0,45.1$, $54.6,55.3,55.5,56.0,66.5,66.8,102.1,105.3,106.7,107.0$, 109.3, 110.7, 111.6, 111.6, 112.6, 113.4, 117.5, 118.2, 122.0, 124.7, 127.2, 128.4, 133.9, 144.6, 146.2, 147.7, 148.1, 148.4, 148.6, 149.3, 154.3. ### 4.3. Determination of the water solubility of $\mathbf{1 4 b}$ and $\mathbf{1 4 f}$

Water solubility for $\mathbf{1 4 b}$ and $\mathbf{1 4 f}$ was determined by an HPLC method. ${ }^{43}$ An excess amount of the solid sample was added to water and the resulting mixture was sonicated for 15 min at room temperature and then passed through a Minisart RC syringe filter (pore size, $0.2 \mu \mathrm{~m}$; Sartorius). Aliquots ( $0.4 \mu \mathrm{~L}$ ) of the filtrate were injected into the HPLC system equipped with an Inertsil Diol column (particle size, $5 \mu \mathrm{~m} ; 250 \times 4.6 \mathrm{~mm}$ I.D.; GL Sciences), eluting with methanol ( $0.01 \%$ trifluoroacetic acid). One point calibration was done by injecting $0.4 \mu \mathrm{~L}$ aliquots of the corresponding water solutions of $\mathbf{1 4 b}$ and $\mathbf{1 4 f}$ with known concentrations.

### 4.4. In vitro kinase assay-general

Recombinant kinase domains (amino residues 696 to the Cterminus) of the EGFR WT and T790M/L858R (Cell Signaling Technology) ( 100 ng ) were preincubated with $1-10,000 \mathrm{nM}$ of lamellarins in 25 mL of kinase reaction buffer ( 120 mM HEPES, $\mathrm{pH} 7.5 ; 10 \mathrm{mM} \mathrm{MnCl} 2 ; 6 \mathrm{mM} \mathrm{Na} 3 \mathrm{VO}_{4}$; and 2.5 mM DTT) at 25 ${ }^{\circ} \mathrm{C}$ for 30 min . Then, 25 mL ATP/substrate solution containing 20 mM of ATP and 6 mM poly (Glu-Tyr) biotinylated peptide (Cell Signaling Technology) was added to the preincubation. The kinase reaction was performed at $25{ }^{\circ} \mathrm{C}$ for 30 min and terminated by adding 50 mL of 50 mM of EDTA, pH 8.0 . Phosphorylation levels were quantified using ELISA with avidincoated 96 -well plates and an anti-phosphotyrosine antibody (PY20). Relative inhibitions were calculated from at least three independent experiments, and $\mathrm{IC}_{50}$ values were estimated using the mean relative inhibition. ${ }^{47}$

### 4.5. Docking simulation

Docking studies were performed using MOE 2014.0901. ${ }^{34}$ Crystal structures of EGFR (T790M/L858R/V948R)-gefitinib complex (PDB ID: 4I22) ${ }^{33}$ was obtained from the Protein Data Bank. The protein structures for the docking was prepared by the following sequence: (i) A EGFR (T790M/L858R/V948R)gefitinib complex was loaded. (ii) To the complex was added hydrogen atoms and electric charge by Protonate 3D (default settings), (iii) The hydrogen atoms were optimized by MMFF94x force field (the heavy atoms were fixed during the optimization). (iv) The dummy atoms were disposed in the docking site by Site Finder (default settings). On the other hand, the conformers of 2, 14b, 14d, 14f, and 18b were obtained by Conformational Search using the LowModeMD search method with default parameters except for the followings: the hydrogens check box was selected in order to include both hydrogen and heavy atoms in the RMSD calculation for duplication detection and the value of energy window was set to $10 \mathrm{kcal} / \mathrm{mol}$. Finally, the ligands were docked into the binding site of the kinases by using the Dock docking program according to the following sequence: (i) Initial poses were obtained using the Triangle Matcher placement (timeout: 3000 s ; No. of return poses: 10000), London dG rescoring 1 (the maximum number of poses: 500), GridMin refinement (default settings), and GBVI/WSA dG rescoring 2 (the maximum number of poses: 100). (ii) The poses obtained in (i) were refined by Forcefield refinement (default settings) and rescored by GBVI/WSA dG scoring function (the maximum number of poses: 100). (iii) The poses obtained in (ii) were refined by Forcefield refinement (sidechain: tether, the tether value was set to 10) and rescored by GBVI/WSA dG scoring function (the maximum number of poses: 100). (iv) The poses obtained in (iii) were refined by Forcefield refinement (sidechain: free) and rescored by GBVI/WSA dG scoring function (the maximum number of poses: 100). The obtained poses were evaluated using the GBVI/WSA dG scoring function and the plausible low
energy binding modes of these lamellarins in the kinase are shown in Fig. 6.

## Acknowledgments

This work was financially supported by Grant-in-Aids for Scientific Research (B) (Grant No. 26293028) and for Scientific Research (C) (Grant No. 15K01802) from the Japan Society for the Promotion of Science (JSPS). We thank Screening Committee of Anticancer Drugs supported by Grant-in-Aid for Scientific Research on Innovative Areas, Scientific Support Programs for Cancer Research, from The Ministry of Education, Culture, Sports, Science and Technology, Japan for the compound evaluations.

## Supplementary data

Supplementary data (synthesis of $\mathbf{8 a}-\mathbf{g} ;{ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectra of all compounds synthesized in this work) can be found, in the online version, at doi:10.1016/j.bmc.2017.00.000.
