Tetrahydro-β-carboline-3-carboxyl-thymopentin: a nano-conjugate for releasing pharmacophores to treat tumor and complications[†]

Xi Hu,^a Ming Zhao,*^{ab} Yuji Wang,^a Yaonan Wang,^a Shurui Zhao,^a Jianhui Wu,^a Xiangmin Li^c and Shiqi Peng*^a

To improve the therapeutic efficacy of cancer patients a novel conjugate of thymopentin (TP5) and (15,35)-1-methyl-tetrahydro- β -carboline-3-carboxylic acid (MTC) was presented. In water and mouse plasma MTCTP5 forms the nanoparticles of 14–139 nm in diameter, the suitable size for delivery in blood circulation. In mouse plasma MTCTP5 releases MTC, while in the presence of trypsin MTCTP5 releases MTC and TP5. On mouse and rat models the MTCTP5 dose dependently slows down the tumor growth, inhibits inflammatory response and blocks thrombosis. The anti-tumor activity as well as the anti-inflammation activity and anti-thrombotic activity of MTCTP5 are 100 fold and 10 fold higher than those of MTC, respectively, which are attributed to the fact that it down-regulates the plasma levels of TNF- α and IL-8 of the treated animals. The immunology enhancing activities *in vitro* and *in vivo* of MTCTP5 are similar to those of TP5, which is attributed to the fact that MTCTP5 up-regulates the plasma levels of L-2 and CD4 as well as down-regulates the plasma level of CD8 of the treated animals. The plasma alanine transaminase, aspartate transaminase and creatinine assays indicate that MTCTP5 treated mice is significantly longer than that of TP5 treated mice.

Introduction

Thymopentin (TP5, RKDVY), the Arg32–Tyr36 fragment of the thymus hormone thymopoietin, is well known as an immunomodulator, plays an important role in T-lymphocyte maturation and differentiation, and is used in the clinic to treat some immunodeficiencies, malignancies and infections.^{1–3} However, TP5 has very short half-life *in vivo* and can be administered either *via* intramuscular injection or *via* intravenous infusion.⁴ Additionally TP5 is successfully used as a pharmacophore or an activity enhancer in the modification of peptides and polymers and formulations for various purposes. Of TP5 modified peptides and polymers, the TP5-RR-6 peptide is for treating tuberculosis,⁵ TP5-thymosin $\alpha 1$ and TP5-iRGD peptides are for treating tumor,^{6,7} TP5-poly(butyl cyanoacrylate) is for enhancing immunomodulatory activity,⁸ and TP5-PLGA-lectins are for improving oral immune-modulatory activity.⁹ Of the formulations TP5 formulated chitosan or bacitracin is for novel intranasal delivery,¹⁰ the co-sprayed dry powders of TP5 with lactose or mannitol are for improving the flow ability,¹¹ the TP5 incorporated copolymer of poly-D-lactide and poly(ethylene glycol) is for slowing the release rate,¹² the aerosol is for improving the systemic action of TP5,¹³ and the mixed polymer matrix of polylactide and poly(lactic-*co*-glycolic) of TP5 is for preparing biodegradable microspheres.¹⁴

β-Carbolines have diverse pharmacological functions, such as inhibiting platelet activation,¹⁵ improving object recognition memory,¹⁶ stimulating insulin secretion,¹⁷ interacting with DNA,^{18,19} and blocking topoisomerases.²⁰ Besides, β-carbolines are the pharmacophores of a series of bioactive agents, such as trypanocidal agents,²¹ anti-malarial agents,^{22,23} neuron-protective and neuron-differentiating agents,²⁴ antiviral agents,²⁵ antileishmanial agents,²⁶ as well as antitumor agents,^{27–30} antiinflammatory agents,³¹ and anti-thrombotic agents in particular.^{32,33}

It is well known that chronic inflammation can increase cancer susceptibility, while anti-inflammatory drugs may retard the development of cancers.^{34,35} Long-term and low-dose administration

of aspirin is associated with lower cancer mortality, suggesting that anti-thrombotic therapy is beneficial for the outcome of cancer patients.³⁶ Thrombotic microangiopathy (TMA) is now recognized as a late complication of cancers.³⁷ Several clinical studies indicate that TMA can develop directly from certain malignancies, but more often results from anticancer therapy.³⁸ These findings emphasize the potential utility of a pharmacophore capable of simultaneously inhibiting cancer, thrombosis and inflammation. Our broad screening identified that (15,3S)-1-methyltetrahydro-β-carboline-3-carboxylic acid (MTC) is such a pharmacophore.^{32,33} However, the antitumor, anti-inflammatory and anti-thrombotic activities of MTC need to be enhanced. In this context, the present paper used TP5 as an enhancer of MTC to prepare nano-scale N-[(1S,3S)-1-methyltetrahydro- β -carboline-3-carboxyl]-Arg-Lys-Asp-Val-Tyr (MTCTP5), and to evaluate the bioactivities.

Materials and methods

General procedures

All L-amino acids were purchased from Sigma-Aldrich Co. (St. Louis, MO, USA). The column chromatography was performed using silica gel (200–300 mesh, Qingdao Haiyang Chemical Co., Qingdao, P. R. China). The purities of MTC, protective TP5 and protective MTCTP5 (>95%) were determined by TLC analysis (Qingdao silica gel plates of GF254). The purity of MTCTP5 (>96%) was determined by HPLC analysis (CHIRALPAK AH-H column, 4.6 \times 250 mm, Daicel Chemical IND., Ltd).

The spectra of ¹H NMR (800 MHz) and ¹³C NMR (200 MHz) were recorded on a Bruker Avance II 800 MHz spectrometer with DMSO- d_6 as the solvent and tetramethylsilane as internal standard. ESI/MS was tested on a ZQ 2000 (Waters, US) and solariX FT-ICR mass spectrometer (Bruker Daltonik) consisting of an ESI/MALDI dual ion source and a 9.4 T superconductive magnet.

K562, A549, HT-29 and HL-60 carcinoma cell lines were purchased from ATCC. Bovine serum albumin (BSA) was purchased from Sigma. Fetal bovine serum (FBS), basal DMEM medium and 1640 medium were purchased from Gibco.

Male Wistar rats and ICR mice were purchased from the Animal Center of Capital Medical University. The protocol was reviewed and approved by the ethics committee of Capital Medical University. The committee ensures that the welfare of the animals was maintained in accordance with the requirements of the Animal Welfare Act and in accordance with the NIH Guide for Care and Use of Laboratory Animals.

All experimental data are presented as average \pm SD. Statistical analyses of all the biological data were carried out by the use of ANOVA by SPSS. *P*-values <0.05 were considered statistically significant.

Synthesis of MTCTP5

MTCTP5 was prepared by the use of the synthetic route depicted in Scheme 1; the preparations of the related intermediates and the chemical physical data thereof are given in the corresponding procedures.

Scheme 1 Synthetic route to MTCTP5. (i) Sulfuric acid; (ii) DMF, di-*tert*butyl dicarbonate (Boc₂O) and triethylamine; (iii) dicyclohexylcarbodiimide (DCC), *N*-hydroxybenzotriazole (HOBt), *N*-methylmorpholine (NMM) and tetrahydrofuran (THF); (iv) hydrochloride in ethyl acetate (4 M); (v) aqueous NaOH (4 M); (vi) H₂, Pd/C and CH₃OH.

Preparing (1*S*,3*S*)-1-methyl-1,2,3,4-tetrahydro-β-carboline-3carboxylic acid (1, MTC)

To a solution of 10.0 g (49.0 mmol) of L-Trp, 4 mL of concentrated H₂SO₄ and 400 mL of water 10 mL of aldehyde (40%) were added. The reaction mixture was stirred at room temperature for 6 h, adjusted to pH 7 with concentrated ammonia, and then kept at 0 °C for 0.5 h. The formed precipitates were collected by filtration to give 8.0 g (70%) of MTC. ESI-MS (*m*/*z*): 231 [M + H]⁺; ¹H NMR (300 MHz, DMSO-*d*₆): δ /ppm = 11.144 (s, 1H), 7.449 (d, *J* = 7.8 Hz, 1H), 7.349 (d, *J* = 7.8 Hz, 1H), 7.090 (t, *J* = 7.2 Hz, 1H), 7.000 (t, *J* = 7.8 Hz, 1H), 4.536 (d, *J* = 6.6 Hz, 1H), 3.636 (dd, *J* = 4.8 Hz, *J* = 12.0 Hz, 1H), 3.204 (dd, *J* = 4.8 Hz, *J* = 12.0 Hz, 1H), 2.792 (m, 1H), 1.630 (d, *J* = 6.6 Hz, 3H).

Preparing (1*S*,3*S*)-1-methyl-2-Boc-1,2,3,4-tetrahydro-βcarboline-3-carboxylic acid (2)

A solution of 8.0 g (34.8 mmol) of MTC and 8.0 g (37.0 mmol) of Boc₂O in 100 mL of DMF was stirred at 0 °C for 30 min and at room temperature for additional 48 h, evaporated under vacuum, the residue was triturated with ether, the residue was dissolved in 100 mL of water and then was acidified with a dilute hydrochloric acid to pH 2. The solution was extracted with ethyl acetate (30 mL \times 3), the ethyl acetate phase was washed with water (30 mL \times 3) and dried with anhydrous sodium sulfate for 12 h. The ethyl acetate phase was filtered and the filtrate was evaporated under vacuum to give 7.6 g

Preparing Boc-Val-Tyr-OBzl

At 0 °C a solution of 0.434 g (2.0 mmol) of Boc-Val, 0.270 g (2.0 mmol) of HOBt, 20 mL of anhydrous THF and 0.450 g (2.2 mmol) of DCC was stirred for 30 min, to which a solution of 0.886 g (2.0 mmol) of Tos Tyr-OBzl in 10 mL of anhydrous THF was added, and adjusted to pH 9 with NMM. The reaction mixture was stirred at room temperature for 8 h and TLC $(CH_2Cl_2:CH_3OH, 40:1)$ indicated the complete disappearance of Tos-Tyr-OBzl. The formed precipitates of dicyclohexylurea (DCU) were removed by filtration, the filtrate was evaporated under vacuum and the residue was dissolved in 100 mL of ethyl acetate. The solution was washed successively with 5% aqueous solution of sodium bicarbonate, 5% aqueous solution of citric acid and saturated aqueous solution of sodium chloride. The ethyl acetate phase was dried with anhydrous sodium sulfate for 12 h. After filtration the filtrate was evaporated under vacuum to provide 0.688 g (88%) of the title compound as colorless powders. ESI-MS (m/z): 471 $[M + H]^+$.

Preparing HCl-Val-Tyr-OBzl

At 0 °C a solution of 0.874 g (1.8 mmol) of Boc-Val-Tyr-OBzl in 10 mL solution of hydrogen chloride in ethyl acetate was stirred for 1 h and then evaporated under vacuum. The residue was dissolved in 20 mL of ethyl acetate and the solution was evaporated under vacuum to thoroughly remove hydrogen chloride and provide 0.701 g (92%) of the title compound as colorless powders for next reaction directly. ESI-MS (*m*/*z*): 371 $[M + H]^+$.

Preparing Boc-Asp(OBzl)-Val-Tyr-OBzl

At 0 °C a solution of 0.578 g (1.8 mmol) of Boc-Asp(OBzl), 0.240 g (1.8 mmol) of HOBt, 20 mL of anhydrous THF and 0.401 g (2.0 mmol) of DCC was stirred for 30 min, to which a solution of 0.758 g (1.8 mmol) of HCl·Val-Tyr-OBzl in 10 mL of anhydrous THF was added, and adjusted to pH 9 with NMM. The reaction mixture was stirred at room temperature for 8 h, and TLC (CH₂Cl₂:CH₃OH, 40:1) indicated the complete disappearance of HCl-Val-Tyr-OBzl. The formed DCU precipitates were removed by filtration, the filtrate was evaporated under vacuum, the residue was dissolved in 100 mL of ethyl acetate and the solution was washed successively with 5% aqueous solution of sodium bicarbonate, 5% aqueous solution of citric acid and saturated aqueous solution of sodium chloride. The ethyl acetate phase was dried with anhydrous sodium sulfate for 12 h. After filtration the filtrate was evaporated under vacuum to provide 1.004 g (82%) of the title compound as colorless powders. ESI-MS (m/z): 676 $[M + H]^+$.

Preparing HCl·Asp(OBzl)-Val-Tyr-OBzl

Using the procedure of preparing HCl·Val-Tyr-OBzl from 1.004 g (1.5 mmol) of Boc-Asp(OBzl)-Val-Tyr-OBzl, 0.687 g (91%) of the title compound was obtained as colorless powders for the next reaction directly. ESI-MS (m/z): 576 [M + H]⁺.

Preparing Boc-Arg-Lys(Z)-OBzl

At 0 °C a solution of 0.552 g (3.0 mmol) of Boc-Arg, 0.405 g (3.0 mmol) of HOBt, 0.675 g (3.6 mmol) of DCC and 20 mL of anhydrous THF was stirred for 30 min, to which a solution of 1.629 g (3.0 mmol) of Tos·Lys(Z)-OBzl in 10 mL of anhydrous THF was added, and adjusted to pH 9 with NMM. The reaction mixture was stirred at room temperature for 8 h and TLC (CH₂Cl₂:CH₃OH, 10:1) indicated the complete disappearance of Tos·Lys(Z)-OBzl. The formed DCU precipitates were removed by filtration and the filtrate was evaporated under vacuum. The residue was dissolved in 100 mL of ethyl acetate. The solution was washed successively with 5% aqueous solution of sodium bicarbonate, 5% aqueous solution of citric acid and saturated aqueous solution of sodium chloride. The ethyl acetate phase was dried with anhydrous sodium sulfate for 12 h. After filtration the filtrate was evaporated under vacuum to provide 1.428 g (74%) of title compound as colorless powders. ESI^+ -MS (m/z): 627 $[M + H]^+$.

Preparing HCl·Arg-Lys(Z)-OBzl

Using the procedure of preparing HCl·Val-Tyr-OBzl from 1.290 g (2.0 mmol) of Boc-Arg-Lys(*Z*)-OBzl, 1.021 g (92%) of the title compound was obtained as colorless powders for next reaction directly. ESI-MS (m/z): 527 [M + H]⁺.

Preparing (1*S*,3*S*)-1-methyl-2-Boc-1,2,3,4-tetrahydro-βcarboline-3-carboxyl-Arg-Lys(*Z*)-OBzl (3)

At 0 °C a solution of 0.506 g (2.2 mmol) of (1S,3S)-1-methyl-2-Boc-1,2,3,4-tetrahydro-β-carboline-3-carboxylic acid, 0.270 g (2.0 mmol) of HOBt, 0.490 g (2.4 mmol) of DCC and 20 mL of anhydrous THF was stirred for 30 min, to which a solution of 1.116 g (2.0 mmol) of HCl·Arg-Lys(Z)-OBzl in 10 mL of anhydrous THF was added, and adjusted to pH 9 with NMM. The reaction mixture was stirred at room temperature for 8 h and TLC (CH_2Cl_2 : CH_3OH , 20:1) indicated the complete disappearance of HCl·Arg-Lys(Z)-OBzl. The formed DCU precipitates were removed by filtration, the filtrate was evaporated under vacuum and the residue was dissolved in 100 mL of dichloromethane. The solution was washed successively with 5% aqueous solution of sodium bicarbonate, 5% aqueous solution of citric acid and saturated aqueous solution of sodium chloride. The dichloromethane phase was dried with anhydrous sodium sulfate for 12 h. After filtration the filtrate was evaporated under vacuum to provide 1.178 g (70%) of the title compound as colorless powders for next reaction directly. ESI-MS (m/z): 839 $[M + H]^+$.

Preparing (1*S*,3*S*)-1-methyl-2-Boc-1,2,3,4-tetrahydro-βcarboline-3-carboxyl-Arg-Lys(*Z*) (4)

At 0 °C a solution of 1.178 g (1.4 mmol) of (1*S*,3*S*)-1-methyl-2-Boc-1,2,3,4-tetrahydro- β -carboline-3-carboxyl-Arg-Lys(*Z*)-OBzl, 10 mL of methanol and 2 mL of aqueous NaOH (2 M) was stirred for 60 min, adjusted to pH 2 with hydrochloric acid (2 M) and evaporated under vacuum. The residue was dissolved in 100 mL of ethyl acetate and the solution was dried with anhydrous sodium sulfate for 12 h. After filtration the filtrate was evaporated under vacuum to provide 1.046 g (99%) of the title compound as colorless powders for next reaction directly. ESI-MS (m/z): 749 [M + H]⁺.

Preparing (1*S*,3*S*)-1-methyl-2-Boc-1,2,3,4-tetrahydro-βcarboline-3-carboxyl-Arg-Lys(*Z*)-Asp(OBzl)-Val-Tyr-OBzl (5)

At 0 °C a solution of 0.773 g (1.0 mmol) of (1S,3S)-1-methyl-2-Boc-1,2,3,4-tetrahydro- β -carboline-3-carboxyl-Arg-Lys(Z), 0.135 g (1.0 mmol) of HOBt, 0.244 g (1.2 mmol) of DCC and 20 mL of anhydrous THF was stirred for 30 min, to which a solution of 0.610 g (1.0 mmol) of HCl·Asp(OBzl)-Val-Tyr-OBzl in 10 mL of anhydrous THF was added, and adjusted to pH 8 with NMM. The reaction mixture was stirred at room temperature for 48 h and TLC (CH2Cl2:CH3OH, 10:1) indicated the complete disappearance of HCl·Asp(OBzl)-Val-Tyr-OBzl. The formed DCU precipitates were removed by filtration, the filtrate was evaporated under vacuum and the residue was dissolved in 100 mL of dichloromethane. The solution was washed successively with 5% aqueous solution of sodium bicarbonate, 5% aqueous solution of citric acid and saturated aqueous solution of sodium chloride. The dichloromethane phase was dried with anhydrous sodium sulfate for 12 h. After filtration the filtrate was evaporated under vacuum to provide 0.824 g (68%) of the title compound as colorless powders. ESI-MS(m/z): 1307 [M + H]⁺; ¹H-NMR (300 MHz, DMSO- d_6): δ /ppm = 10.910 (s, 1H), 9.292 (s, 1H), 8.455 (m, 2H), 8.166 (m, 1H), 7.531 (m, 2H), 7.312 (m, 15H), 7.223 (m, 4H), 6.976 (d, J = 2.7 Hz, 2H), 6.652 (d, J = 2.7 Hz, 2H), 5.001 (m, 7H), 4.683 (m, 1H), 4.438 (m, 1H), 4.306 (m, 3H), 3.233 (m, 1H), 3.168 (m, 2H), 2.949-2.785 (m, 6H), 2.665 (m, 1H), 1.929 (m, 1H), 1.540–1.247 (m, 21H), 0.729 (dd, J = 7.5 Hz, J = 15.0 Hz, 6H).

Preparing (1*S*,3*S*)-1-methyl-1,2,3,4-tetrahydro-β-carboline-3carboxyl-Arg-Lys-Asp-Val-Tyr (MTCTP5, 6)

To a suspension of 0.100 g (0.077 mmol) of (15,35)-1-methyl-2-Boc-1,2,3,4-tetrahydro-β-carboline-3-carboxyl-Arg-Lys(Z)-Val-Tyr-OBzl, 20 mL of methanol, 0.2 mL of formic acid and 20 mg of Pd/C (10%) hydrogen gas were bubbled for 20 h and TLC indicates the complete disappearance of (1S,3S)-1-methyl-2-Boc-tetrahydro-β-carboline-3-carboxyl-Arg-Lys(Z)-Val-Tyr-OBzl. The reaction mixture was filtered and the filtrate was evaporated under vacuum. The residue was treated with 10 mL of ethyl acetate containing hydrogen chloride (4 M) to remove Boc. After removal of hydrogen chloride 0.056 g (63%) of the title compound was obtained as colorless powders. Mp 123-124 °C; $[\alpha]_{D}^{25} = -89.0$ (c 0.10, CH₃OH); FT-MS (*m*/*z*): 892.47541 [M + H]⁺; HPLC purity (CH₃OH: H₂O = 95%: 5%, C₁₈, 1.0 mL min⁻¹): 96%. ¹H-NMR (800 MHz, DMSO- d_6): δ /ppm = 11.287 (s, 1H), 9.246 (s, 1H), 8.946 (s, 1H), 8.532 (s, 1H), 8.257 (s, 1H), 8.194 (d, *J* = 8.0 Hz, 1H), 8.005 (s, 3H), 7.485 (d, *J* = 8.0 Hz, 1H), 7.472 (m, 1H), 7.432 (d, J = 8.0 Hz, 1H), 7.383 (m, 1H), 7.130 (t, J = 8.0 Hz, 1H), 7.040 (t, J = 8.0 Hz, 1H), 6.974 (t, J = 8.0 Hz, 2H), 6.657 (d, J = 8.0 Hz, 2H), 4.722 (m, 1H), 4.567 (m, 1H), 4.433 (m, 1H), 4.315 (m, 2H), 4.225 (m, 1H), 3.122 (m, 3H), 2.896 (m, 2H), 2.898 (m, 2H), 2.785 (m, 1H), 2.753 (m, 2H), 2.672 (m, 1H), 2.562 (m, 1H), 1.984 (m, 1H), 1.859 (m, 1H), 1.694 (d, J = 6.4 Hz, 3H), 1.645–1.241 (m, 8H), 0.799 (dd, *J* = 7.2 Hz, *J* = 24.0 Hz, 6H);

¹³C-NMR (200 MHz, DMSO-d₆): δ/ppm = 173.30, 171.95, 171.26, 171.06, 170.64, 157.53, 156.42, 136.85, 130.43, 128.55, 127.85, 126.20, 125.97, 125.95, 122.16, 119.70, 118.40, 115.48, 111.90, 105.29, 57.47, 56.37, 54.35, 52.99, 52.73, 50.09, 49.85, 49.06, 36.36, 31.53, 27.00, 25.43, 23.94, 22.54, 19.60, 18.04, 16.91; IR (KBr): 3167.12, 3059.20, 2962.66, 2931.80, 2873.94, 1720.50, 1654.92, 1543.05, 1516.05, 1450.47, 1396.46, 1319.31, 1226.73.

Preparing Boc-Arg-Lys(Z)-Asp(OBzl)-Val-Tyr-OBzl

At 0 °C a solution of 0.627 g (1.0 mmol) of Boc-Arg-Lys(Z)-OBzl, 10 mL of methanol and 2 mL of aqueous NaOH (2 M) was stirred for 60 min, adjusted to pH 7 with hydrochloric acid (2 M), and evaporated under vacuum. The residue was dissolved in 100 mL of THF, mixed with 0.135 g (1.0 mmol) of HOBt and 0.244 g (1.2 mmol) of DCC, stirred at 0 °C for 30 min, to which a solution of 0.550 g (0.9 mmol) of HCl·Asp(OBzl)-Val-Tyr-OBzl in 10 mL of anhydrous THF was added, and adjusted to pH 8 with NMM. The reaction mixture was stirred at room temperature for 48 h and TLC (CH₂Cl₂:CH₃OH, 10:1) indicated the disappearance of HCl·Asp(OBzl)-Val-Tyr-OBzl. The formed DCU precipitates were removed by filtration, the filtrate was evaporated under vacuum, the residue was dissolved in 100 mL of CH₂Cl₂, and the solution was successively washed with 5% aqueous solution of sodium bicarbonate, 5% aqueous solution of citric acid and saturated aqueous solution of sodium chloride. The CH₂Cl₂ phase was dried with anhydrous sodium sulfate for 12 h. After filtration the filtrate was evaporated under vacuum to provide 0.564 g (57%) of the title compound as colorless powders. ESI-MS (m/z): 1095 $[M + H]^+$; ¹H-NMR (300 MHz, DMSO- d_6): δ/ppm = 8.441 (m, 2H), 7.803 (m, 2H), 7.597-7.434 (m, 4H), 7.321–7.223 (m, 15H), 7.140 (d, J = 8.4 Hz, 2H), 6.938 (d, J = 8.4 Hz, 2H), 5.031 (m, 6H), 4.666 (m, 1H), 4.502 (m, 1H), 4.260 (m, 2H), 3.918 (m, 1H), 3.165 (m, 2H), 3.012–2.778 (m, 6H), 1.923 (m, 1H), 1.722-1.485 (m, 6H), 1.369-1.238 (m, 13H), 0.743 (m, 6H).

Preparing Arg-Lys-Asp-Val-Tyr (TP5)

To a suspension of 0.100 g (0.091 mmol) of Boc-Arg-Lys(*Z*)-Val-Tyr-OBzl, 20 mL of methanol, 0.2 mL of formic acid and 20 mg of Pd/C (10%) hydrogen gas were bubbled for 20 h and TLC indicates the complete disappearance of Boc-Arg-Lys(*Z*)-Asp(OBzl)-Val-Tyr-OBzl. The reaction mixture was filtered, the filtrate was evaporated under vacuum and the residue was treated with 10 mL of ethyl acetate containing hydrogen chloride (4 M) to remove Boc. After removal of hydrogen chloride 0.036 g (58%) of the title compound was obtained as colorless powders. ESI-MS (*m*/*z*): 680 [M + H]⁺; ¹H-NMR (300 MHz, D₂O): δ /ppm = 7.039 (d, *J* = 8.4 Hz, 2H), 6.628 (d, *J* = 8.4 Hz, 2H), 4.606–4.525 (m, 2H), 4.323 (m, 1H), 3.984–3.871 (m, 2H), 3.151–3.040 (m, 3H), 2.922–2.819 (m, 3H), 2.802–2.603 (m, 2H), 1.925–1.502 (m, 9H), 1.419–1.312 (m, 2H), 0.738 (m, 6H).

Trypsin promoted release of MTCTP5

To a solution of MTCTP5 (1 μ M) in ultrapure water 200 μ L of trypsin (800 UI) was added, at 37 °C incubated for 10, 20, 30, and 60 min, and 10 μ L of the supernatant was used to carry out ESI-MS experiments using positive and negative MALDI ion modes.

Mouse plasma stability of MTCTP5

Mouse blood was collected in 1 mg mL⁻¹ of aqueous solution of heparin sodium (1:9, v/v) and immediately centrifuged at 3000 rpm for 15 min to collect the plasma. To 200 µL of plasma 200 µL solution of MTCTP5 (2 µM) in ultrapure water was added and incubated at 37 °C for 10, 20, 30, 60 and 90 min. To the plasma 800 µL of methanol was added and the sample was centrifuged at 3000 rpm for 10 min, and then 10 µL of the supernatant was used to carry out the ESI-MS experiment.

Measuring the FT-MS spectra of MTCTP5

The positive MALDI FT-MS spectrum of aqueous solution of MTCTP5 (10^{-6} nM) was measured on a solariX FT-ICR mass spectrometer (Bruker Daltonics, Billerica, MA, USA) with an ESI/MALDI dual ion source and a 9.4 T superconductive magnet. The ion source was a Smart-beam-II laser (wavelength, 355 nm; focus setting, 'medium'; repetition rate, 1000 Hz). The QCID spectrum was set to 2000 *m*/*z*, and the isolation window was 5 *m*/*z*. Data were collected using solariX-control software. Spectral data were processed using data analysis software (Bruker Daltonics).

Measuring the NOESY 2D NMR spectra of MTCTP5

One-dimensional ¹H NMR spectra of 12 mg of MTCTP5 in 0.5 mL of deuteron dimethyl sulfoxide (DMSO- d_6) were measured on a Bruker 800 MHz spectrometer. The probe temperature was regulated to 298 K. Using a simple pulse-acquire sequence zg30 the spectra were recorded. To ensure the full relaxation of ¹H resonance typical acquisition parameters consisting of 64 K points covering a sweep width of 16447 Hz, a pulse width (pw90) of 8.63 µs and a total repetition time of 24 s were used. Before FT the digital zero filling to 64 K and a 0.3 Hz exponential function were applied to the FID. The resonance at 2.5 ppm presented CD₂HSOCD₂H (the impurity in the residual solvents) and tetramethylsilane (TMS) was used as internal reference. Standard absorptive 2D ¹H-¹H COSY was measured using the same spectrometer. Each spectrum consisted of a matrix of 2 K (F2) by 0.5 K (F1) covering a sweep width of 9615.4 Hz. Before FT the matrix was zero filled to 1 K by 1 K and the standard sinebell apodization functions were applied in both dimensions. 2D NOESY tests were carried out in the phase-sensitive mode by using the same spectrometer. Spectra were obtained using spinlock mixing periods of 200 ms.

Measuring the TEM image of MTCTP5

The shape and the size of the nanospecies of MTCTP5 in water were measured using transmission electron microscopy (TEM, JSM-6360 LV, JEOL, Tokyo, Japan). In brief, an aqueous solution of MTCTP5 (pH 6.7, 10^{-7} nM) was dripped onto a formvarcoated copper grid. The grid was allowed to dry thoroughly in air and then was heated at 35 °C for 14 days. The copper grids were viewed under a TEM. The shape and size distribution of the nanospecies were determined by counting >100 species in randomly selected regions on the copper grid. Each determination was carried out with triplicate grids and at 80 kV (the electron beam accelerating voltage). Images were recorded on an imaging plate (Gatan Bioscan Camera Model 1792, Pleasanton, CA, USA) with 20 eV energy windows at $6000-400\,000\times$ and were digitally enlarged.

Measuring SEM images of MTCTP5

The shape and the size of the nanospecies of MTCTP5 in the solid state were measured using scanning electron microscopy (SEM, JEM-1230, JEOL, Tokyo, Japan) at 50 kV. In brief, the lyophilized powders from 10^{-7} nM solution of MTCTP5 in ultrapure water were attached to a copper plate with double-sided tape (Euromedex, Strasbourg, France). The specimens were coated with 20 nm gold–palladium using a Joel JFC-1600 Auto Fine Coater. The coater was operated at 15 kV, 30 mA, and 200 mTorr (argon) for 60 s. The shape and size distribution of the nanospecies were measured by examining >100 species in randomly selected regions on the SEM alloy. Each measurement was performed with triplicate grids. Images were recorded on an imaging plate (Gatan Bioscan Camera Model 1792) with 20 eV energy windows at 100–10 000×, and were digitally enlarged.

Measuring AFM images of MTCTP5

Atomic force microscopy (AFM) experiments were performed in the contact mode using a Nanoscope 3D AFM (Veeco Metrology, Santa Barbara, CA, USA) under ambient conditions. AFM images of mouse plasma alone or MTCTP5 in mouse plasma (10^{-7} nM) were recorded using a standard procedure.

Measuring the particle size of MTCTP5

The particle size of MTCTP5 in ultrapure water was measured on a Particle Size Analyzer (Zeta Plus S/N 21394, Brookhaven Instruments Corporation) using a dynamic light scattering (DLS) model. The concentration of the solution of MTCTP5 in ultrapure water was 10^{-7} nM and the testing temperature was 25 °C. The size measurement was repeated for 3 runs per sample every day, and totally tested for 7 consecutive days.

Measuring zeta potential of the nanospecies of MTCTP5

The surface zeta potential of the nanospecies of MTCTP5 in ultrapure water or in mouse plasma was measured on a ZetaPlus Potential Analyzer (ZetaPlus S/N 21394, Brookhaven Instruments Corporation) with a BIC Zeta Potential Analyzer. The concentration of the solution of MTCTP5 in ultrapure water or in mouse plasma was 10^{-7} nM and the testing temperature was 25 °C. The zeta potential measurement was repeated for 3 runs per sample, and the data were calculated automatically using the software from the electrophoretic mobility based on Smoluchowski's formula.

Energy-minimization conformations of MTCTP5

MTCTP5 was sketched in ChemDraw 10.0, converted to 3D conformation in Chem3D 10.0 and then energy was minimized in Discovery Studio 3.5 with a MMFF force field. The energy-minimized conformation was utilized as the starting one for conformation generation. The energy-minimized conformations were sampled in the whole conformational space *via* systematic search and BEST methods in Discovery Studio 4.0. Both of the

systematic search and BEST methods were practiced using a SMART minimizer with a CHARMm force field. The energy threshold was set to 20 kcal mol⁻¹ at 300 K. The maximum minimization steps and the RMS gradient were set to 200 Å and 0.1 Å, respectively. The maximum generated conformations were set to 255 with a RMSD cut-off of 0.2 Å.

Molecular docking of MTCTP5 towards the active site of bovine trypsin

The 3D structure of MTCTP5 was built using a 3D-sketcher module and energy minimized in Discovery Studio 4.0 with a SMART minimizer using the CHARMm force field. The crystal structure of bovine trypsin (PDB ID: 4MTB) was from the Protein Data Bank, and the binding sphere (9.0 Å) of the (2R)-2-amino-N-(2S)-1-[(4-carbamimi-doylbenzyl)amino]-1-oxopro-pan-2-yl-4-(4-hydroxyphenyl)-butanamide domain was defined. The water molecules were removed, and hydrogen atoms were added under the CHARMm force field. Docking calculations were performed using the LibDock module implemented in Accelrys Discovery studio 4.0, which is a high-through put docking algorithm that positions catalyst generated ligand conformations in the protein active site based on polar and apolar interaction sites (hotspots). The results could be displayed by analyzing and scoring docked ligand poses. To find a top rank pose and measure the goodness of a docking study, the LibDock Score was used as the criteria. The binding site "hotspots" were set to 100. The conformation generation of the ligands was carried out using the BEST method. The energy threshold was set to 20 kcal mol⁻¹, the maximum minimization steps were set to 1000, the minimization RMS gradient was set to 0.001 Å, and the maximum generated conformations were set to 255 with a RMSD cut-off of 1.0 Å.

In vivo xylene-induced ear edema assay

Male ICR mice were 10 weeks old at the beginning of the experiment, randomly divided into 6 groups (12 per group) and intraperitoneally administered with MTCTP5 (2, 0.2 and $0.02 \,\mu\text{mol}\,\text{kg}^{-1}$) or MTC (2 $\mu\text{mol}\,\text{kg}^{-1}$) or aspirin (1100 $\mu\text{mol}\,\text{kg}^{-1}$) or NS (10 mL kg⁻¹). Thirty minutes after the administration 0.03 mL of xylene was applied to the anterior and posterior surfaces of right ears of the mice, and left ears without xylene application were used as the controls. Two hours after xylene application the mice were anesthetized with ether and sacrificed for the removal of both ears. Using a cork borer of 7 mm in diameter the ears were punched to take circular pieces for weighing. Ear edema was represented with the weight difference between the circular pieces of right and left ears.

In vivo anti-thrombotic assay

Male Wistar rats (250–300 g) were randomly divided into 6 groups (12 per group), and MTCTP5 (2, 0.2 and 0.02 μ mol kg⁻¹) or MTC (2 μ mol kg⁻¹) or aspirin (167 μ mol kg⁻¹) or NS (10 mL kg⁻¹) was intraperitoneally administered. Thirty minutes after the administration the rats were anesthetized with intraperitoneally pentobarbital sodium (80.0 mg kg⁻¹), the right carotid artery and the left jugular vein were separated. A weighed 6 cm thread was

inserted into the middle of a polyethylene tube. The polyethylene tube was filled with NS solution of heparin sodium (50 IU mL⁻¹) and one end was inserted into the left jugular vein. From the other end of the polyethylene tube heparin sodium was injected as an anticoagulant and this end was inserted into the right carotid artery. Blood was allowed to flow from the right carotid artery to the left jugular vein through the polyethylene tube for 15 min. The thread was removed to obtain the weight of the wet thrombus.

In vivo anti-tumor assay

Male ICR mice were 10–12 weeks old at the beginning of experiments. S180 cells for initiation of subcutaneous tumors were obtained in ascitic form of the mouse tumors, which were serially transplanted once a week. Subcutaneous tumors were implanted by injecting 0.2 mL of NS containing 1.8×10^7 viable tumor cells under the skin on right oxter. Twenty four hours after implantation the tumor bearing mice were randomized into 6 experimental groups (12 per group). All mice were given a daily intraperitoneal injection of doxorubicin (2 µmol kg⁻¹ per day in NS) or MTC (2 µmol kg⁻¹ per day in NS) or NS (10 mL kg⁻¹ per day) or MTCTP5 (0.002, 0.02, 0.2 and 2 µmol kg⁻¹ per day in NS) for 12 consecutive days. Twenty four hours after the last administration, all mice were sacrificed by ether anesthesia and the tumors were dissected and weighed.

In vivo carbon clearance assay

In vivo carbon clearance assay was performed using a standard procedure. In brief, ICR mice were divided into 3 groups of 10 animals each and given a daily intraperitoneal injection of MTCTP5 (2 μ mol kg⁻¹ per day in NS) or TP5 (positive control, 2μ mol kg⁻¹ per day in NS) or NS (blank control, 10 mL kg⁻¹ per day) or for 7 consecutive days. On the 8th day the mice were intraperitoneally injected with a suspension of 0.1 mL of indian ink and NS solution of gelatine (1%, w/v). One and ten minutes after the administration the blood was sampled, mixed with aqueous Na₂CO₃ (0.1%, 4 mL) and the absorbance was measured at 660 nm to calculate carbon clearance based on $m_{\text{body}}/(m_{\text{liver}} + m_{\text{spleen}}) \times [(\text{Log OD1} - \text{Log OD2})/9]^{1/3}, \text{ wherein}$ OD1 refers to the absorbance at 10 min and OD2 refers to the absorbance at 1 min, m_{body} , m_{liver} and m_{spleen} refer to the bodyweight, liver weight and spleen weight of the tested mice, respectively.

In vivo IL-2, CD4 and CD8 assays

0.9 mL of blood of the mice receiving carbon clearance assay was collected into a syringe containing 0.1 mL of 3.8% sodium citrate and immediately centrifuged at 3000 rpm for 10 min. The separated plasma was used to measure plasma levels of IL-2, CD4 and CD8 by ELISA according to the manufacturer's protocols. In brief 100 μ L of plasma or standard solution was added into the wells of anti-body coated 96 microtiter plates, incubated at 37 °C for 90 min, and washed with 100 μ L of wash buffer 5 times; 100 μ L of biotinylated antibody was added, incubated at 37 °C for 60 min, and washed with 100 μ L of wash buffer 5 times; 100 μ L of HRP-conjugate reagent was added,

incubated at 37 °C for 30 min, and washed with 100 μ L of wash buffer 5 times; 50 μ L of chromogen solution A and 50 μ L of chromogen solution B were added, and incubated at 37 °C for 15 min; 100 μ L of stop solution was added, and the absorbance of the yellow solutions was recorded at 450 nm.

In vitro spleen lymphocyte proliferation assay

The effects of MTCTP5 on Babl/c spleen lymphocyte proliferation were measured using MTT assay. The spleen lymphocytes were prepared according to a standard procedure. In brief under sterile conditions after rapid collection spleens were placed in cold RPMI-1640 containing 10% FCS supplemented with antibiotics (100 UI mL^{-1} of penicillin and 100 mg mL^{-1} of streptomycin). Cells were teased apart and gently passed through a 40 gm nylon mesh to remove clumps of cells and connective tissue. After two time wash of PBS the cell suspension was adjusted to a final concentration of 5 \times 10⁵ cells per mL RPMI-1640 with 10% FCS in 96-well microtiter plates, and the blastogenic assays were carried out with 0.2 mL of suspensions. Cell viability was tested by the use of fluorescein diacetate. The cultures of splenocyte cells were at 37 °C incubated with mitogen concanavalin A (Con-A, 5×10^{-5} M) and 5% CO2 for 48 h, and the cells received MTT assay to calculate the relative spleen lymphocyte proliferation (%) according to proliferation% = (ODT - ODC)/ODC \times 100%, wherein ODT refers to the absorbance of MTCTP5 and ODC refers to the absorbance of RPMI-1640 (blank control).

Plasma TNF-α assay on S180 mice

In the preparation of the plasma sample 0.9 mL of blood was collected from healthy mice or S180 mice receiving MTCTP5 $(2, 0.2, 0.02 \ \mu\text{mol kg}^{-1})$ or NS into a syringe containing 0.1 mL of 3.8% sodium citrate. The sample was centrifuged at 4 °C and 3000 rpm for 10 min to prepare the plasma sample. To each of the three blank wells nothing was added. To each of the six standard wells 100 µL of standard solution was added. To each of the three testing wells 100 µL of the plasma sample from healthy mice or the mice receiving NS or MTCTP5 (2, 0.2, $0.02 \ \mu mol \ kg^{-1}$) was added. Then the plate was closed with a closure plate membrane and at 37 °C incubated for 40 min. Upon uncovering the closure plate membrane the liquid was discarded from the well and dried by swinging, to the residue in the well sufficient washing buffer, which was prepared by diluting the wash solution with 30 fold distilled water, was added, maintained for 30 s, and then drained. After 5 repeats of the procedure, 50 µL of biotinylated antibody solution and 50 µL of distilled water were added, then the plate was closed with a closure plate membrane and at 37 °C incubated for 30 min. Upon uncovering the closure plate membrane the liquid was discarded from the well and washed by sufficient washing buffer 5 times. After 5 repeats of the procedure, 100 µL of biotinylated antibody solution was added and the plate was closed with a closure plate membrane and at 37 $^\circ \rm C$ incubated for 30 min. Upon uncovering the closure plate membrane the liquid was discarded from the well and washed by sufficient washing buffer 5 times and dried by patting. To the residue in the well 50 µL of chromogen solution A and 50 µL of chromogen

solution B were added, gently mixed and at 37 °C and protection from light incubated for 10 min. To each well 50 μ L of stop solution was added, and the color in the well changed from blue to yellow. The plate was read at 450 nm using a microtiter plate reader within 15 min to record the O.D. value. According to the standard curve the concentrations of TNF- α in plasma were calculated.

Plasma IL-8 assay on S180 mice

In the preparation of the plasma sample 0.9 mL of blood was collected from healthy mice or S180 mice receiving MTCTP5 $(2, 0.2, 0.02 \ \mu mol \ kg^{-1})$ or NS into a syringe containing 0.1 mL of 3.8% sodium citrate. The sample was centrifuged at 4 °C and 3000 rpm for 10 min to prepare the plasma sample. To each of the three blank wells nothing was added. To each of the six standard wells 100 µL of standard solution was added. To each of the three testing wells 100 µL of the plasma sample from healthy mice or the mice receiving NS or MTCTP5 (2, 0.2, 0.02 μ mol kg⁻¹) was added. Then the plate was closed with a closure plate membrane and at 37 °C incubated for 40 min. Upon uncovering the closure plate membrane the liquid was discarded from the well and dried by swinging, to the residue in the well sufficient washing buffer, which was prepared by diluting the wash solution with 30 fold distilled water, was added, maintained for 30 s, and then drained. After 5 repeats of the procedure, 50 µL of biotinylated antibody solution and 50 µL of distilled water were added, then the plate was closed with a closure plate membrane and at 37 °C incubated for 30 min. Upon uncovering the closure plate membrane the liquid was discarded from the well and washed by sufficient washing buffer 5 times. After 5 repeats of the procedure, 100 µL of biotinylated antibody solution was added and the plate was closed with a closure plate membrane and at 37 °C incubated for 30 min. Upon uncovering the closure plate membrane the liquid was discarded from the well and washed by sufficient washing buffer 5 times and dried by patting. To the residue in the well 50 µL of chromogen solution A and 50 µL of chromogen solution B were added, gently mixed and at 37 °C and protection from light incubated for 10 min. To each well 50 µL of stop solution was added, and the colour in the well changed from blue to yellow. The plate was read at 450 nm using a microtiter plate reader within 15 min to record the O.D. value. According to the standard curve the concentrations of IL-8 in plasma were calculated.

Lifespan assay

Lifespan assay was performed by using a standard procedure. In brief, male ICR mice were 10–12 weeks old at the beginning of experiments. S180 cells for the initiation of subcutaneous tumors were obtained from the ascitic form of the tumors in mice, which were serially transplanted once a week. Subcutaneous tumors were implanted by injecting 0.2 mL of NS containing 1×10^7 viable tumor cells under the skin on right oxter. Twenty four hours after implantation the tumor bearing mice were randomized into 4 experimental groups (12 per group). All mice were given a daily intraperitoneal injection of TP5 (2 µmol kg⁻¹ per day in NS) or MTC (2 µmol kg⁻¹ per day in NS)

or NS (10 mL kg⁻¹ per day) or MTCTP5 (2 μ mol⁻¹kg per day in NS) for 33 consecutive days. Mouse death due to tumor burden was noted and the lifespan was calculated as [(T - C)/C]%, wherein *T* and *C* represent the survival days of treated and untreated mice, respectively.

Plasma ALT and AST assays

0.9 mL of blood of the mice receiving anti-tumor assay was collected into a syringe containing 0.1 mL of 3.8% sodium citrate and immediately centrifuged at 3000 rpm for 10 minutes to get the plasma samples. The separated plasma was used to measure plasma levels of alanine transaminase (ALT) and aspartate transaminase (AST) according to the guidance of the kits (AST/GOT testing kit, ALT/GPT testing kit; JCBIO Co., Nanjing, People's Republic of China). In brief 5 µL of plasma was added into the test wells of 96 microtiter plates, then 20 µL of Matrix liquid was added and incubated at 37 °C for 30 min, 5 µL of plasma was added into the control wells of 96 microtiter plates, 20 µL of 2,4-dinitrophenylhydrazine was added to all wells, and incubated at 37 °C for 20 min, 200 µL of 0.4 mol L⁻¹ NaOH was added, and incubated at 37 °C for 15 min, and the absorbance of the yellow solutions was recorded at 510 nm to calculate vitality based on $(OD_{test} - OD_{control}) \times K_{curve}$, wherein OD_{test} refers to the absorbance of the test well, OD_{control} refers to the absorbance of the control well, and K_{curve} refers to the standard curve which is calculated using the absorbance of the standard well following the manufacturer's protocols.

Plasma Cr assay

0.9 mL of blood of the mice receiving anti-tumor assay was collected into a syringe containing 0.1 mL of 3.8% sodium citrate and immediately centrifuged at 3000 rpm for 10 minutes to get the plasma samples. The separated plasma was used to measure plasma levels of creatinine (Cr) according to the guidance of the kits (Cr testing kit; JCBIO Co., Nanjing, People's Republic of China). In brief 6 μ L of plasma or standard solution was added into the wells of 96 microtiter plates, 180 μ L of the enzyme solution A was added to incubate at 37 °C for 5 min, 60 μ L of the absorbance of the purple solutions was recorded

at 546 nm to calculate vitality based on $(OD_{test} - OD_{control}) \times K_{curve}$, wherein OD_{test} refers to the absorbance of the test well, $OD_{control}$ refers to the absorbance of the control well and K_{curve} refers to the standard curve.

Results and discussion

1. Synthesis and structural characterization

1.1. Preparation and chemical structure of MTCTP5. MTC (2) and the intermediates (3–5) were prepared by following the previous procedure.^{39,40} TP5 and the intermediates were prepared by following the general route.^{41–43}

As depicted in Scheme 1 MTCTP5 was prepared via 12-step reactions, the yields ranged from 63% to 99% and the total yield was 5.6%. The ¹H NMR, ¹³C NMR, FT-MS and IR spectra are given as Fig. S1–S8 of the ESI, \dagger which supports MTCTP5 having a correct chemical structure.

1.2. Nanofeature and size of MTCTP5

The nanofeature and the size of MTCTP5 in water, at the solid state and in mouse plasma were described using TEM, SEM and AMF images, respectively.

TEM images (Fig. 1A) indicate that when the powders of MTCTP5 are dissolved in ultrapure water to form a solution of 10^{-7} nM MTCTP5 the nanoparticles of 30–110 nm in diameter can be formed. The inset indicates that in the amplified nanoparticle 7 small particles are included and on the surface of the amplified nanoparticle numerous holes of ~7 nm in diameter are observed.

SEM images (Fig. 1B) indicate that the solids resulted from 10^{-7} nM solution of MTCTP5 in ultrapure water are equally distributed nanoparticles of 10–92 nm in diameter, for most nanoparticles the diameter is less than 50 nm.

AFM images (Fig. 1C) indicate that in mouse plasma MTCTP5 (final concentration, 10^{-7} nM) forms nanoparticles of 14–139 nm in diameter, for most nanoparticles the diameter is less than 100 nm, and some nanoparticles can form aggregates. On the other hand no any comparable nanoparticle is found in the AFM image of mouse plasma alone (Fig. 1D).

The DLS determinations of 7 consecutive days explored that in ultrapure water the nano-size of MTCTP5 ranged from 186 nm

Fig. 1 Nanofeature and size of MTCTP5. (A) TEM image of MTCTP5 in ultrapure water (10^{-7} nM); (B) SEM image of the solids from a solution of MTCTP5 in ultrapure water (10^{-7} nM); (C) AFM image of MTCTP5 in mouse plasma (10^{-7} nM); (D) AFM image of mouse plasma alone; (E) the change of the nanosize of MTCTP5 in ultrapure water within 7 days.

to 320 nm in diameter. These data imply that the nanoparticles' diameter of MTCTP5 in water increases slightly in 7 days (Fig. 1E).

The zeta-potential determinations explored that in ultrapure water and in mouse plasma the zeta-potentials of MTCTP5 were -8.56 ± 0.89 mV and -25.13 ± 0.98 mV, respectively. These data imply that the nanoparticles' diameter of MTCTP5 in ultrapure water is larger than that of MTCTP5 in mouse plasma, and this should benefit the delivery of the nanoparticles in blood circulation.

2. Bioactivity related to the MTC moiety of MTCTP5

2.1. *In vivo* **anti-tumor activity of MTCTP5.** The anti-tumor activity of MTCTP5 was examined using S180 tumor bearing mouse assay and represented with tumor weight. Fig. 2A indicates that the tumor weights of the mice intraperitoneally receiving 2 μ mol kg⁻¹ of MTC and 0.02 μ mol kg⁻¹ of MTCTP5 are significantly lower than those of the mice intraperitoneally receiving NS, while the tumor weight of the mice intraperitoneally receiving 0.2 μ mol kg⁻¹ of MTCTP5 is equal to that of the mice intraperitoneally receiving 2 μ mol kg⁻¹ of Dox.

2.2. In vivo anti-thrombotic activity of MTCTP5. The anti-thrombotic activity of MTCTP5 was examined using rat thrombosis assay and represented with thrombus weight. Fig. 2B indicates that the thrombus weights of the rats receiving 2 μ mol kg⁻¹ of MTC are significantly lower than those of the rats receiving NS, suggesting that at 2 μ mol kg⁻¹ of dose MTC can inhibit the rats to form thrombus. Fig. 2B also indicates that the thrombus weight of the rats receiving 2 μ mol kg⁻¹ of MTC is significantly higher than that of the rats receiving 0.2 μ mol kg⁻¹ of MTCTP5, while the thrombus weight of the rats receiving 1 μ mol kg⁻¹ of MTCTP5 is equal to that of the rats receiving 167 μ mol kg⁻¹ of aspirin.

2.3. In vivo anti-inflammation activity of MTCTP5. The anti-inflammation activity of MTCTP5 was examined using xylene-induced ear edema assay. Fig. 2C indicates that the anti-inflammation activity of 2 μ mol kg⁻¹ of MTC is significantly higher than that of NS and is equal to that of 0.02 μ mol kg⁻¹ of MTCTP5. Besides, the anti-inflammation activity of 0.2 μ mol kg⁻¹ of MTCTP5 is equal to that of 1100 μ mol kg⁻¹ of aspirin.

3. Bioactivity related to the TP5 moiety of MTCTP5

3.1. Proliferation of splenocyte cells treated with MTCTP5. The immunology enhancing activity related to the TP5 moiety was tested with the *in vitro* proliferation of splenocyte cells treated with MTCTP5. Fig. 3A indicates that the proliferation of splenocyte cells treated with 50 μ M of ConA plus 100 μ M of TP5 is equal to that of splenocyte cells treated with 50 μ M of ConA plus 100 μ M of MTCTP5, and is significantly higher than that of splenocyte cells treated with 50 μ M of ConA alone.

3.2. In vivo phagocytosis index of MTCTP5 treated ICR mice. The immunologic enhancing activity related to the TP5 moiety was further tested using carbon clearance assay and is represented with the phagocytosis index of MTCTP5 treated ICR mice. Fig. 3B indicates that the phagocytosis index of ICR mice treated with 2 μ mol kg⁻¹ of MTCTP5 is equal to that of ICR mice treated with 2 μ mol kg⁻¹ of TP5, and is significantly higher than that of ICR mice treated with NS.

4. Effect of MTCTP5 on TNF- α , IL-8, IL-2, CD4 and CD8 of the treated mice

4.1. Effect of MTCTP5 on plasma TNF- α of the treated mice. To explore the action mechanism of MTCTP5 inhibiting thrombosis, inflammation and tumor growth the plasma TNF- α of MTCTP5 treated S180 mice was tested. The data of Fig. 4A indicate that the plasma TNF- α of 2 and 0.2 µmol kg⁻¹ of MTCTP5 treated S180 mice is significantly lower than that of NS treated S180 mice, while the plasma TNF- α of 0.02 µmol kg⁻¹ of MTCTP5 treated S180 mice is equal to that of NS treated S180 mice.

4.2. Effect of MTCTP5 on IL-8 of the treated mice. To explore the action mechanism of MTCTP5 inhibiting thrombosis, inflammation and tumor growth the plasma IL-8 of MTCTP5 treated S180 mice was also tested. The data of Fig. 4B indicate that the plasma IL-8 of 2 and 0.2 μ mol kg⁻¹ of MTCTP5 treated S180 mice, while the plasma IL-8 of 0.02 μ mol kg⁻¹ of MTCTP5 treated S180 mice, while the plasma IL-8 of 0.02 μ mol kg⁻¹ of MTCTP5 treated S180 mice is equal to that of NS treated S180 mice.

4.3. Plasma IL-2, CD4 and CD8 of MTCTP5 treated ICR mice. The immunology enhancing activities related to the TP5 moiety of MTCTP5 were tested using plasma IL-2, CD4 and CD8 assays *in vivo*. Fig. 4C–E indicate that the plasma IL-2 and CD4

Fig. 2 In vivo anti-tumor, anti-thrombotic and anti-inflammatory activities of MTCTP5. (A) At 0.002 μ mol kg⁻¹ of dose MTCTP5 effectively allows the tumor growth of S180 mice; (B) at 0.2 μ mol kg⁻¹ of dose MTCTP5 effectively inhibits the rats to form thrombus; (C) at 0.2 μ mol kg⁻¹ of dose MTCTP5 effectively inhibits the rats to form thrombus; (C) at 0.2 μ mol kg⁻¹ of dose MTCTP5 effectively inhibits the rats to form thrombus; (C) at 0.2 μ mol kg⁻¹ of dose MTCTP5 effectively inhibits the rats to form thrombus; (C) at 0.2 μ mol kg⁻¹ of dose MTCTP5 effectively inhibits the rate of the rate of

Fig. 3 The immunology enhancing activities of MTCTP5. (A) Effect of MTCTP5 on the *in vitro* proliferation of splenocyte cells, n = 6; (B) effect of MTCTP5 on the phagocytosis index of MTCTP5 treated ICR mice, n = 10.

of 2 μ mol kg⁻¹ of MTCTP5 treated ICR mice are equal to those of 2 μ mol kg⁻¹ of TP5 treated ICR mice and are significantly higher than those of NS treated ICR mice, meanwhile CD8 of 2 μ mol kg⁻¹ of MTCTP5 treated ICR mice is equal to that of 2 μ mol kg⁻¹ of TP5 treated ICR mice and is significantly lower than that of NS treated ICR mice.

5. Toxicity of MTCTP5

5.1. Plasma ALT of MTCTP5 treated S180 mice. The hepatotoxicity of MTCTP5 was examined using plasma alanine transaminase (ALT) assay. In brief, the blood from the mice receiving *in vivo* antitumor assay was collected to obtain the plasma. The plasma ALT was measured according to the guidance of the kit, and the data are shown in Fig. 5A. Plasma ALT of the sham mice, the NS treated mice and 2 μ mol kg⁻¹ of MTCTP5 treated mice exhibits no significant difference.

5.2. Plasma AST of MTCTP5 treated S180 mice. The hepatotoxicity of MTCTP5 was also examined using plasma aspartate transaminase (AST) assay. In brief, the blood of the mice receiving *in vivo* antitumor assay was collected to obtain the plasma. The plasma AST was measured according to the guidance of the kit, and the data are shown in Fig. 5B. Plasma AST of sham mice, of NS treated mice and of 2 μ mol kg⁻¹ of MTCTP5 treated mice exhibits no significant difference.

5.3. Plasma Cr of MTCTP5 treated S180 mice. The renal toxicity of MTCTP5 was examined using plasma creatinine (Cr) assay. In brief, the blood from the mice receiving *in vivo* antitumor assay was collected to obtain the plasma. The plasma

Cr was measured according to the guidance of the kit, and the data are shown in Fig. 5C. The plasma Cr of sham mice, of NS treated mice and of 2 μ mol kg⁻¹ of MTCTP5 treated mice exhibits no significant difference.

5.4. Survival time of MTCTP5 treated S180 mice. The systemic toxic action of MTCTP5 was firstly examined with the vital stage of S180 tumor bearing mouse assay and represented with the survival time. Fig. 5D indicates that the survival time of NS treated mice is equal to that of 2 μ mol kg⁻¹ of TP5 treated mice. Fig. 5D also indicates that the survival time of 2 μ mol kg⁻¹ of MCTP5 treated mice is significantly longer than those of NS and 2 μ mol kg⁻¹ TP5 treated mice.

6. MTCTP5 releasing MTC and/or TP5

6.1. MTCTP5 releasing MTC in mouse plasma. To explore the release profile 1 mg of MTCTP5 in 1 mL of mouse plasma at 37 °C was incubated for 10, 20, 30, 60 and 90 min, and the plasma samples were extracted with ultrapure water for ESI-MS analysis. Fig. 6A indicates that 60 min after the incubation the ESI(+)-MS spectrum of the extract gives an ion peak at 892.39 of the molecule of MTCTP5 plus H, $[M + H]^+$ (exact mass: 892.46). Fig. 6B shows the total ion current chromatograms of 1 mg of MTCTP5 in 1 mL of mouse plasma at 37 °C incubated for 1, 5, 10, 30 and 60 min, and suggests that at 37 °C mouse plasma MTCTP5 can stably exist for more than 60 min. Fig. 6C plots the incubation time vs. the area of total ion current chromatogram, and suggests that at 37 °C mouse plasma MTCTP5 has a halflife of 9.98 min. Fig. 6D shows the ESI(-)-MS spectrum of MTCTP5 in mouse plasma at 37 °C incubated for 30 min, and gives the ion peak at 264.98 of the molecule of MTC plus Cl, $[M + Cl]^-$ (exact mass: 265.07). Fig. 6E shows the ESI(-)-MS spectrum of mouse plasma alone at 37 °C incubated for 30 min, and gives no such peak.

6.2. MTCTP5 releasing MTC and TP5 in trypsin. To estimate the release profile of MTCTP5 in the presence of trypsin a solution of 1 mg of MTCTP5 and 800 IU of trypsin in 1 mL of ultrapure water was at 37 °C incubated for 30 min, of which the ESI(+/-)-MS spectra are shown in Fig. 7. The locally amplified ESI(+)-MS spectrum between 800 and 900 gives a peak of the molecular ion of MTCTP5 plus H at 892.21, $[M + H]^+$ (exact mass: 892.46, Fig. 7A). The locally amplified ESI(-)-MS spectrum between 200 and 850 gives a peak of the molecular ion of MTC plus Cl at 264.75, $[M + Cl]^+$ (exact mass: 265.07), and a peak of the molecular ion of TP5 minus H at 678.63, $[M - H]^-$

Fig. 4 Effect of MTCTP5 on TNF- α and IL-8. (A) Plasma TNF- α of MTCTP5 treated S180 mice, n = 12; (B) plasma IL-8 of MTCTP5 treated S180 mice, n = 12; (C) peripheral blood IL-2 of MTCTP5 treated ICR mice, n = 10; (D) peripheral blood CD4 of MTCTP5 treated ICR mice, n = 10; (E) peripheral blood CD8 of MTCTP5 treated ICR mice, n = 10.

(A) Plasma ALT of the mice treated with MTCTP5, n = 12; (B) plasma AST of the mice treated with MTCTP5, n = 12; (C) plasma Cr of the mice treated with MTCTP5, n = 12; (D) survival time of the mice treated with MTCTP5, n = 12; (C) plasma Cr of the mice treated with MTCTP5, n = 12; (D) survival time of the mice treated with MTCTP5, n = 12; (C) plasma Cr of the mice treated with MTCTP5, n = 12; (D) survival time of t

Fig. 6 ESI-MS spectra, total ion current chromatogram/time course of MTCTP5 in mouse plasma. (A) ESI(+)-MS spectrum of MTCTP5 in mouse plasma incubated for 60 min; (B) total ion current chromatograms of MTCTP5 in mouse plasma incubated for 1, 5, 10, 30 and 60 min; (C) area of the total ion current chromatogram of MTCTP5 in mouse plasma incubated for 1, 5, 10, 30 and 60 min; (D) ESI(-)-MS spectrum of MTCTP5 in mouse plasma incubated for 30 min and the ion peak of MTC; (E) ESI(-)-MS spectrum of mouse plasma alone incubated for 30 min.

(exact mass: 678.36, Fig. 7B). The total ESI(+)-MS spectrum of a solution of 1 mg of MTCTP5 and 800 IU of trypsin in 1 mL of ultrapure water incubated at 37 $^{\circ}$ C for 30 min is shown in Fig. 7C. Fig. 7D shows the locally amplified ESI(-)-MS spectrum between 200 and 850 of 800 IU of trypsin in 1 mL of ultrapure water incubated at 37 $^{\circ}$ C for 30 min, and gives no comparable ion peaks of MTC plus Cl and TP5 minus H.

To explain the molecular mechanism of trypsin promoting MTCTP5 to release MTC and TP5, MTCTP5 was docked into the active site of bovine trypsin (Fig. 7E). It was found that MTCTP5 well fitted the active site, and well interacted with the amino acid residues of the active site.

Discussion

Using the synthetic route MTCTP5 can be successfully prepared in acceptable yield and desirable purity. In water the molecular association leads to MTCTP5 to form trimers. The qCID spectrum suggests that under the conditions of FT-MS fragmentation the trimer directly forms the monomer, and no any dimer could be observed. Three interesting cross-peaks of the NOESY 2D NMR spectrum define the association manner of 3 molecules in forming the trimer. Due to the distances between two H atoms of the cross-peak are less than 4 Å, thus to form a trimer three molecules of MTCTP5 have to approach in the manner shown in Fig. S10A and B (ESI†) and should take flyer-like conformation of Fig. S10C (ESI†).

The images of TEM, SEM and AFM explore that the selfassembly of the trimers leads MTCTP5 to spontaneously form nanoparticles. The appropriate size of 14–139 nm in diameter is beneficial for the delivery of the nanoparticles in blood circulation. The zeta potentials of the nanoparticles of MTCTP5 in water and mouse plasma are -8.56 ± 0.89 mV and -25.13 ± 0.98 mV, respectively, and support the stability of the nanoparticles.

The anti-tumor assay indicates that the tumor weight of the mice treated with 0.02 μ mol kg⁻¹ of MTCTP5 is significantly lower than those of the mice treated with both 2 μ mol kg⁻¹ of MTC and NS, suggesting that the minimal effective dose of MTCTP5 in treating tumor is 0.02 μ mol kg⁻¹, and the conjugation of TP5 with MTC leads the anti-tumor activity of MTC to an increase of 100 fold. Besides, the tumor weight of the mice treated with 0.2 μ mol kg⁻¹ of MTCTP5 is equal to that of the mice treated with 2 μ mol kg⁻¹ of Dox, meaning that the activity of MTCTP5 is 10 fold higher than that of Dox. It is worth indicating that in the *in vitro* MTT assay the IC₅₀ of MTCTP5 against K562,

Fig. 7 ESI-MS spectra of MTCTP5 in the presence of trypsin. (A) ESI(+)-MS spectrum of MTCTP5 in the presence of trypsin at 37 °C incubated for 30 min; (B) locally amplified ESI(-)-MS spectrum of MTCTP5 in the presence of trypsin at 37 °C incubated for 30 min; (C) ESI(+)-MS spectrum of MTCTP5 in the presence of trypsin at 37 °C incubated for 30 min; (D) locally amplified ESI(-)-MS spectrum of trypsin at 37 °C incubated for 30 min; (E) the interaction of MTCTP5 in the active site of bovine trypsin was hypothesized to be responsible for the release of TP5 and MTC.

A549, HT-29 and HL-60 cells is higher than 150 μ M, suggesting that the anti-tumor action of MTCTP5 *in vivo* is independent of the cytotoxic action.

The anti-thrombotic assay indicates that the thrombus weight of the rats receiving 0.2 μ mol kg⁻¹ of MTCTP5 is significantly lower than those of the rats receiving 2 μ mol kg⁻¹ of MTC and NS, meaning that the minimal effective dose of MTCTP5 in treating thrombus is 0.2 μ mol kg⁻¹ as well as the conjugation of TP5 and MTC leads the anti-thrombotic activity of MTC to an increase of >10 fold. Besides, the thrombus weight of the rats receiving 2 μ mol kg⁻¹ of MTCTP5 is equal to that of the rats receiving 167 μ mol kg⁻¹ of aspirin, suggesting that the anti-thrombotic activity of MTCTP5 is 83.5 fold higher than that of aspirin.

The anti-inflammatory assay indicates that xylene-induced ear edema of the mice treated with 0.2 μ mol kg⁻¹ of MTCTP5 is significantly lower than that of the mice treated with NS, suggesting that the minimal effective dose of MTCTP5 in treating inflammation is 0.2 μ mol kg⁻¹. Xylene-induced ear edema of the mice treated with 0.2 μ mol kg⁻¹ of MTCTP5 is equal to that of the mice treated with 2 μ mol kg⁻¹ of MTCTP5 is equal to that of the mice treated with 2 μ mol kg⁻¹ of MTC, suggesting that the conjugation of TP5 and MTC leads the anti-inflammatory activity of MTC to an increase of 10 fold. Besides, xylene-induced ear edema of the mice treated with of 2 μ mol kg⁻¹ of MTCTP5 is equal to that of the mice treated with 1100 μ mol kg⁻¹ of aspirin, *i.e.* the anti-inflammatory activity of MTCTP5 is 550 fold higher than that of aspirin.

Chronic inflammation has been recently correlated with thromboembolism,⁴⁴ which is well documented as the commonly

encountered implications of cancer patients.^{45,46} The facts that at 0.2 µmol kg⁻¹ of dose MTCTP5 simultaneously slows tumor growth, inhibits thrombosis and depresses inflammation demonstrate that MTCTP5 is a promising lead compound for treating cancer patients without complicating chronic inflammation and thromboembolism.

Splenocyte cell proliferation assay indicates that for ConA treated splenocyte cells the enhanced proliferations of 100 μ M of TP5 and 100 μ M of MTCTP5 are the same, suggesting that the conjugation of MTC with TP5 does not weaken the *in vitro* immunology enhancing activity of TP5. Carbon clearance assay indicates that at 2 μ mol kg⁻¹ of dose the phagocytosis index of TP5 and MTCTP5 treated mice is the same and significantly higher than that of NS treated mice, suggesting that the conjugation of MTC with TP5 does not weaken the *in vivo* immunology enhancing activity of TP5.

The plasma TNF- α and IL-8 levels of 2, 0.2 and 0.02 µmol kg⁻¹ of MTCTP5 treated S180 mice indicate that MTCTP5 down regulates the plasma levels of TNF- α and IL-8 of S180 mice in a dose-dependent manner. The significantly different plasma levels of TNF- α and IL-8 of 0.2 µmol kg⁻¹ of MTCTP5 and NS treated S180 mice indicate that the minimal effective dose of MTCTP5 down regulating plasma levels of TNF- α and IL-8 of S180 mice is 0.2 µmol kg⁻¹. The plasma levels of TNF- α and IL-8 of 2 µmol kg⁻¹ of MTCTP5 treated S180 mice and the sham mice are the same indicating that at 2 µmol kg⁻¹ of dose MTCTP5 can resume the plasma TNF- α and IL-8 of S180 mice to the normal level. Due to the fact that plasma TNF- α and IL-8 are considered

as the biomarker of tumor, thrombus and inflammation, MTCTP5 dose-dependently down-regulates the plasma levels of TNF- α and IL-8 of S180 mice that would be responsible for simultaneously inhibiting tumor growth, thrombus formation and inflammatory response.

The plasma IL-2 and CD4 levels of 2 μ mol kg⁻¹ of MTCTP5 and 2 μ mol kg⁻¹ of TP5 treated S180 mice are the same and significantly lower than those of NS treated S180 mice, while the CD8 levels of 2 μ mol kg⁻¹ of MTCTP5 and 2 μ mol kg⁻¹ of TP5 treated S180 mice are the same and significantly lower than those of NS treated S180 mice indicating that MTC conjugating TP5 does not change the immunology enhancing action of TP5. Due to the fact that plasma IL-2, CD4 and CD8 are considered the biomarker of immunomodulation, MTCTP5 regulates the plasma levels of IL-2, CD4 and CD8 that would be responsible for its immunology enhancing activity.

The quantitative release of MTC from MTCTP5 was confirmed with the total ion current chromatograms of ESI(+)-MS spectra of the aqueous extracts of MTCTP5 in mouse plasma at 37 °C incubated for 10, 20, 30, 60 and 90 min. The results not only support that in blood circulation MTCTP5 can release MTC, thereby inhibiting tumor growth, thrombus formation and inflammatory response, but also giving MTCTP5 a half-life of 9.98 min. Compared to TP5 (half-life, ~9 s) the half-life of MTCTP5 is ~60 fold longer, and this should be responsible for the enhanced bioactivities of MTCTP5.

Even though ESI(+/-)-MS spectra of the aqueous extracts fail to give the ion peak of TP5, the ESI(-)-MS spectrum of the incubation sample of MTCTP5 in the presence of trypsin gives both the ion peaks of MTC and TP5. Thus we hypothesize that MTCTP5 should be a nanomedicine capable of releasing MTC and TP5.

Conclusions

The nano-scale conjugate of TP5 and MTC (MTCTP5) is a novel delivery system for TP5 and MTC. At 37 °C plasma MTCTP5 can exist for at least 60 min and can release MTC and TP5. Compared to MTC, MTCTP5 possesses significantly higher anti-inflammatory, anti-thrombotic and anti-tumor activities. Compared to TP5, MTCTP5 possesses similar immunology enhancing activity. Besides, MTCTP5 minimally injures the liver and kidney. The appropriate nano-structure, the potent efficacy, the minimal toxic action, and the correlations of the bioactivities with IL-8, THF- α , IL-2, CD4 and CD8 demonstrate that MTCTP5 would be a promising nanomedicine.
