Abstract: Treatment of N-alkoxyamides with NBS in toluene was found to conveniently afford the corresponding carboxylic esters, including those bearing a bulky or long-chain substituent, in satisfactory to excellent yields. This approach not only represents a convenient and economic approach to a direct transformation of an alkoxyamide moiety into the carboxylic ester functional group, via oxidative homocoupling and the subsequent thermal denitrogenation, but also facilitates the synthesis of sterically hindered carboxylic esters.

The ester moiety is an important functional group that has found wide occurrences in polymers, pharmaceutical agents and biologically relevant natural products. Although many methods have been reported for the synthesis of esters,¹ formation of hindered esters continues to remain as a challenge. In traditional esterification reactions, a bulky group on either the carboxylic acid or the alcohol

ACS Paragon Plus Environment

significantly hampers the reaction.²⁻⁴ This effect is also observed in the reactions between acid chlorides and alcohols.²⁻⁴ Consequently, special reagents and procedures are normally required for achieving these sterically bulky carboxylic esters.⁵ Undoubtedly, development of novel methods for efficient synthesis of hindered esters is in high demand.

In contrast to the formation of carboxylic esters, it has been reported that bulky substituents do not hamper the synthesis of hydroxamic esters, either by reactions of acid chlorides with alkoxyamines or by alkylations of sodium salts of hydroxamic acids.⁶ In this regard, a direct conversion of *N*-alkoxyamides to carboxylic esters as an efficient strategy to the synthesis of hindered esters can be envisaged. A literature survey⁷⁻¹⁰ shows that N-alkoxyamides 1 can be converted to N_{N} -bisheteroatom-substituted amides A, which are unstable and can thermally decompose to generate the corresponding esters. However, heavy metal oxidants, such as nickel(IV) peroxide hydrate $(NiO_2 H_2O)$,⁷ ceric ammonium nitrate (CAN),⁷ silver oxide $(Ag_2O)^8$ or lead(IV) acetate $(Pb(OAc)_4)^{9-10}$ have always been used as oxidants for the dimerization reactions (Figure 1, path a). In 2002, Glover and coworkers⁶ reported that *N*-alkoxyamides, after being converted to N-chlorohydroxamates, could react with sodium azide to furnish the ester products via Heron rearrangement (Figure 1, path b). It is worth noting that this attractive two-step method could be well applied to the synthesis of some highly hindered esters. In this article, we report a more convenient one-step conversion of alkoxyamides to carboxylic esters through reactions of alkoxyamides with the readily available NBS in toluene (Figure 1, path c). Consistent with Glover's findings,⁶ this alternative approach also provides accesses to sterically hindered esters. The advantages of the current method, in comparison to the existing methods, are its directness of one-step and low-cost of the reagents.

Figure 1. Methods for conversions of N-alkoxyamides to Hindered Esters.

In fact, our original research objective was focused on forming *N*-bromo-*N*-methoxybenzamide **3** and then to study its role as a nitrenium ion precursor in some intermolecular electrophilic substitution reactions¹¹ that we were interested in. Knowing the fact that α,β -unsaturated *N*-acyl-amino acid ester could be converted to its *N*-bromo product mediated by NBS,¹² we applied the method to have *N*-methoxybenzamide **1a** reacting with NBS. However, to our surprise, when **1a** was treated with NBS in DCE at room temperature, ester **2a** was formed in 77% yield, with trace of the desired compound **3** formed. Although unexpected, this new finding led us to establish a novel method for the synthesis of carboxylic ester compounds from the corresponding alkoxyamides.

Considering that the yield obtained for **2a** was somewhat low, **1a** was used as a model substrate to further optimize the reaction conditions. Solvent-screening experiments revealed that the reaction could occur in polar as well as nonpolar solvents (Table 1, entries 1-8), and the reaction in toluene gave the best yield within a relatively short period of time (Table 1, entry 8). When the reaction temperature was raised to 60 °C, the reaction was completed in 0.3 h with negligible decrease in yield (Table 1, entry 9). A parallel experiment (Table 1, entry 10) of using 0.5 equiv of NBS was **ACS Paragon Plus Environment**

carried out to determine the molar ratio of each reactant, and the result showed that close to 50 mol% of **1a** was recovered. This finding clearly indicated that at least 1.0 equiv of NBS was necessary for the total conversion of **1a** to **2a**. Other *N*-halosuccinimides (NCS and NIS) were also tested, and the results showed that they gave inferior yields when compared with NBS (Table 1, entries 11 and 12).

With the optimal reaction conditions (Table 1, entry 9) in hand, the scope of this newly established NBS-mediated direct conversion of alkoxyamide to carboxylic esters was explored. The *N*-methoxybenzamide derivatives **1b-1g**, bearing either aromatic electron-donating or electron-withdrawing groups, could all be converted to the corresponding esters by the method. With the increasing of the electron-withdrawing ability of the aromatic substituent, the yield of the reaction decreased (Table 2, entries 1-7). When the substrate bears a nitro group, other than the relatively lower yield, the reaction needed longer reaction time for a complete conversion (Table 2, entry 7). The analogous *N*-benzyloxybenzamides **1h-1j** could also be converted the corresponding benzyl benzoates **2h-2j** under the described conditions which indicates that the R² group is not restricted to only the methyl group, but can be extended to other alkyl groups as well (Table 2, entries 8-10). Replacing the phenyl ring with a heterocyclic thienyl ring in the substrate does not

hamper the reaction and the desired product **2k** could be obtained in moderate yield (Table 2, entry 11). Furthermore, *N*-methoxycinnamamides could also be converted the corresponding carboxylic esters by the same method, with the alkenyl moiety being well tolerated during the process (Table 2, entries 12 and 13). Finally, the method was also applicable to the substrate bearing aliphatic carboxylic amides, with the products being achieved in acceptable to moderate yields (Table 2, entries 14-17). For this class of substrates, the electron-withdrawing groups in the aromatic ring on either the acid or the alcohol side do not have an obvious impact on the yield. Furthermore, a chlorine atom in the substrate could also be well tolerated, albeit the desired product was obtained in a slightly lower yield (Table 2, entry 18).

NBS, toluene

Table 2. Conversion of N-Alkoxyamides to Carboxylic Esters Mediated by NBS^{*a*}

∠OR²

^a Reaction conditions: 1 (1.0 mmol) and NBS (1.0 mmol) in toluene (10 mL) at 60 °C unless otherwise stated. ^b Isolated yields. ^c The reaction was stirred at 80 °C.

An important application of this methodology is in the synthesis of hindered esters, which is known to be difficult to obtain by the classic methods.^{2-4,6} Our experiments show that when R^2 is a bulky *t*-butyl group, substrates **1aa-1ac**, bearing an aromatic or benzyl R^1 group, rendered the corresponding esters **2aa-2ac** in moderate to good yields (Table 3, entries 1-3). When the R^2 substituent is a long-chain alkyl group containing 12 carbons, the reaction afforded the desired products in excellent yield (Table 3, entries 4 and 5). Besides, for substrates bearing a bulky R^1 group, the reaction also delivered the desired products in high yields (Table 3, entries 6-7). Most delightedly, we found this method could be applicable to the synthesis of the esters bearing both bulky R^1 and R^2 groups (Table 3, entries 8-10).

It is worth noting that *N*-methoxybenzamide **1c**, bearing a bromo-substituted phenyl group, was converted to its homodimer **3c** if the reaction was run at room temperature. The isolated homodimer **3c**, upon being heated in toluene at 80 °C for 1 h, afforded the benzoate **2c** in 90% yield. The observation of **3c** demonstrates that the reaction adopts a cascade sequence involving the oxidative homocoupling step, and followed by the subsequent thermal denitrogenation.

Scheme 2. Formation of the Homodimer 3c and Its Thermal Decomposition

Based on the previous reports in literature^{7,11g} as well as our own studies, we propose here a possible mechanism for this oxidative homocoupling and thermal denitrogenation process. Since at least 1 equiv of NBS was needed, we postulate that alkoxyamide 1 firstly reacted with NBS to afford *N*-bromohydroxamate **B**. Then the N-Br bond in intermediate **B** underwent the homolytic cleavage to give the *N*-centered radical species,^{11g} which dimerized to form *N*,*N'*-diacyl-*N*,*N'*-dialkoxyhydrazine **C**, with the concurrent release of a molecular Br₂ (formed from the released bromine radicals). As intermediate **C** is thermally unstable, it decomposed to generate ester **2** and nitrene **D** by a 1,1-elimination pathway.⁷ Finally, nitrene **D** decomposed to afford nitrogen and another molecule of ester **2**.⁷ For all the above reactions studied, it was observed that the reaction solution displayed a dark red color (likely due to the generated Br₂) at the early stage, while gradually diminished along the progress of the reaction. At the same time, benzyl bromide **4** was detected being formed in all the reactions as a side product, which obviously resulted from the reaction between the solvent toluene and the generated Br₂.

Scheme 3. Proposed Reaction Pathway

In summary, we have demonstrated a novel methodology for the direct conversion of alkoxyamides to carboxylic esters via NBS-mediated oxidative homocoupling and thermal denitrogenation reactions. The features of the present method include the readily availability of the starting materials, the mild reaction conditions, and most significantly, its economic application to the synthesis of a wide range of sterically hindered esters.

Experimental Section

I. General Information. ¹H and ¹³C NMR spectra were recorded on a 600 MHz spectrometer (150 MHz for ¹³C NMR) at 25 °C. Chemical shifts values were given in ppm and referred to the internal standard TMS set as 0.00 ppm. The peak patterns were indicated as follows: s, singlet; d, doublet; t, triplet; q, quartet; qui, quintet; m, multiplet; td, triplet of doublets and dd, doublet of doublets. The coupling constants, *J*, are reported in Hertz (Hz). High resolution mass spectrometry (HRMS) was obtained on a Q-TOF micro spectrometer. Melting points were determined with a micromelting point apparatus without corrections. TLC plates were visualized by UV fluorescence quenching and KMnO₄ staining. Reagents and solvents were purchased as reagent grade and were used without further purification. All reactions were performed in standard glassware, heated at 70

^oC for 3 h before use. Flash column chromatography was performed over silica gel 200-300 mesh and the eluent was a mixture of ethyl acetate (EA) and petroleum ether (PE).

II. Preparation of Alkoxyamides 1. All the known amides $1a^{13}$, $1b-1d^{14}$, $1e-1f^{15}$, $1h^{13}$, $1j^{16}$, $1k^{15}$, $1l^{17}$, $1n^{11}$, $1o^{18}$, $1r^{19}$, $1af^{20}$, $1ag^7$ and $1aj^7$ were prepared in accordance with the indicated literature procedures.

Amides 1g, 1i, 1m, 1p, 1q, 1aa-1ae, 1ah and 1ai were prepared by the following known or modified procedures.

General Procedure A:¹⁴ To the carboxylic acid (10 mmol) was added thionyl chloride (20 mmol) followed by a catalytic amount of DMF (1 drop). The mixture was stirred at 60 °C until completion (ca. 3 h). The solvent was then removed under reduced pressure to afford the crude acid chloride. Alkoxyamine hydrochloride (11 mmol) was added to a mixture of K_2CO_3 (20 mmol) in a 2:1 mixture of EA:H₂O (0.2 M). The resulting solution was cooled to 0 °C followed by dropwise addition of the crude acid chloride dissolved in EA (5 mL). The reaction was allowed to stir for 4 h while reaching room temperature. The two layers were separated and the aqueous phase was extracted with EA (20 mL × 2). The combined organic phase was dried over anhydrous Na₂SO₄, filtered, and evaporated under reduced pressure. The residue was purified by flash column chromatography on silica gel to give the desired products.

General Procedure B: To the carboxylic acid (10 mmol) was added thionyl chloride (20 mmol) followed by a catalytic amount of DMF (1 drop). The reaction was then stirred at 60 °C until completion (ca. 3 h). The solvent was then removed under reduced pressure to afford the crude acid chloride. TEA (22 mmol) was added to a mixture of alkoxyamine hydrochloride (11 mmol) in DCE (0.2 M). The resulting mixture was cooled to 0 °C followed by dropwise addition of the crude acid

chloride dissolved in DCE (5 mL). The reaction was allowed to stir at room temperature overnight. The reaction mixture was then diluted with DCM (40 mL) and washed with water (40 mL) and brine (40 mL). The organic phase was dried over anhydrous Na₂SO₄, filtered, and evaporated under reduced pressure. The residue was purified by flash column chromatography on silica gel to give the desired products.

The novel amides thus obtained were characterized as follows:

N-Methoxy-2-nitrobenzamide (1g). Following the general procedure A, amide 1g was isolated as a light yellow solid. Yield: 1.72 g, 88%, mp. 88-89 °C. ¹H NMR (600 MHz, CDCl₃) δ (mixture of two rotamers) 8.57 (s, 1H), 8.14 (d, *J* = 6.6 Hz, 1H), 7.72 (s, 1H), 7.64 (t, *J* = 7.5 Hz, 1H), 7.55 (d, *J* = 6.6 Hz, 1H), 3.94 (s, 2H), 3.44 (s, 1H). ¹³C NMR (150 MHz, CDCl₃) δ 164.4, 146.3, 133.8, 131.0, 129.4, 129.1, 124.5, 63.6. HRMS (ESI) *m/z* calcd for C₈H₈N₂NaO₄⁺ [M + Na⁺] 219.0376; found 219.0357.

N-(**Benzyloxy**)-**3**-methylbenzamide (1i). Following the general procedure A, amide 1i was isolated as a white solid. Yield: 2.17 g, 90%, mp. 89-90 °C. ¹H NMR (600 MHz, CDCl₃) δ 8.88 (s, 1H), 7.51 (s, 1H), 7.46-7.40 (m, 3H), 7.38-7.33 (m, 3H), 7.29 (d, *J* = 7.5 Hz, 1H), 7.25 (m, 1H), 5.01 (s, 2H), 2.34 (s, 3H). ¹³C NMR (150 MHz, CDCl₃) δ 166.4, 138.5, 135.4, 132.7, 131.8, 129.3, 128.7, 128.6, 128.5, 127.9, 124.1, 78.3, 21.3. HRMS (ESI) *m/z* calcd for C₁₅H₁₅NNaO₂⁺ [M + Na⁺] 264.0995; found 264.0971.

N-(4-Methoxybenzyloxy)cinnamamide (1m). Following the general procedure B, amide 1m was isolated as a white solid. Yield: 1.56 g, 55%, mp. 117-118 °C. ¹H NMR (600 MHz, CDCl₃) δ 7.68 (d, J = 15.7 Hz, 1H), 7.46 (s, 2H), 7.33 (d, J = 8.2 Hz, 5H), 6.87 (d, J = 8.3 Hz, 2H), 6.34 (br s, 1H), 4.90 (s, 2H), 3.76 (s, 3H). ¹³C NMR (150 MHz, CDCl₃) δ 164.7, 159.9, 141.5, 134.8, 131.0, 129.8,

128.8, 128.0, 127.5, 117.5, 113.9, 78.0, 55.2. HRMS (ESI) *m/z* calcd for C₁₇H₁₇NNaO₃⁺ [M + Na⁺] 306.1101; found 306.1088.

N-(**Benzyloxy**)-2-(4-fluorophenyl)acetamide (1p). Following the general procedure A, amide 1p was isolated as a white solid. Yield: 2.43 g, 94%, mp. 103-104 °C. ¹H NMR (600 MHz, CDCl₃) δ (mixture of two rotamers) 8.52 (s, 0.77H), 8.09 (s, 0.23H), 7.31 (m, 5H), 7.14 (br s, 2H), 6.96 (m, 2H), 4.85 (s, 1.55H), 4.74 (s, 0.45H), 3.62 (s, 0.45H), 3.36 (s, 1.55H). ¹³C NMR (150 MHz, CDCl₃) δ 168.7, 162.0 (d, $J_{C-F} = 245.6$ Hz), 135.2, 130.7(d, $J_{C-F} = 6.6$ Hz), 130.1, 129.2, 128.7, 128.5, 115.5 (d, $J_{C-F} = 21.3$ Hz), 78.0, 39.3. HRMS (ESI) *m/z* calcd for C₁₅H₁₄FNNaO₂⁺ [M + Na⁺] 282.0901; found 282.0867.

N-(3-Nitrobenzyloxy)octanamide (1q). Following the general procedure B, amide 1q was isolated as a white solid. Yield: 1.47 g, 50%, mp. 110-111 °C. ¹H NMR (600 MHz, CDCl₃) δ 8.26 (s, 1H), 8.21 (d, *J* = 7.5 Hz, 1H), 7.77 (d, *J* = 5.8 Hz, 1H), 7.57 (t, *J* = 7.7 Hz, 1H), 5.01 (s, 2H), 2.09 (s, 2H), 1.66-1.58 (m, 2H), 1.26 (m, 8H), 0.87 (t, *J* = 6.8 Hz, 3H). ¹³C NMR (150 MHz, CDCl₃) δ 171.8, 148.2, 137.7, 134.9, 129.5, 123.5, 123.4, 76.7, 33.1, 31.6, 29.1, 28.9, 25.4, 22.6, 14.0. HRMS (ESI) *m/z* calcd for C₁₅H₂₂N₂NaO₄⁺ [M + Na⁺] 317.1472; found 317.1432.

N-tert-Butoxy-3,4-dimethoxybenzamide (1aa). Following the general procedure A, amide 1aa was isolated as a white solid. Yield: 1.99 g, 79%, mp. 114-115 °C. ¹H NMR (600 MHz, CDCl₃) δ 7.38 (d, *J* = 1.7 Hz, 1H), 7.31 (d, *J* = 8.2 Hz, 1H), 6.84 (d, *J* = 8.3 Hz, 1H), 3.91 (d, *J* = 1.7 Hz, 6H), 1.33 (s, 9H). ¹³C NMR (150 MHz, CDCl₃) δ 167.4, 151.4, 148.9, 124.9, 120.1, 110.7, 110.3, 82.1, 77.4, 77.2, 77.0, 55.9, 55.9, 55.9, 26.4. HRMS (ESI) *m/z* calcd for C₁₃H₁₉NNaO₄⁺ [M + Na⁺] 276.1206; found 276.1177.

The Journal of Organic Chemistry

4-Bromo-*N***-***tert***-butoxybenzamide (1ab).** Following the general procedure A, amide **1ab** was isolated as a white solid. Yield: 2.25 g, 83%, mp. 133-134 °C. ¹H NMR (600 MHz, CDCl₃) δ 8.60 (s, 1H), 7.62 (d, *J* = 8.3 Hz, 2H), 7.53 (d, *J* = 8.4 Hz, 2H), 1.32 (s, 9H). ¹³C NMR (150 MHz, CDCl₃) δ 167.0, 131.7, 131.3, 128.9, 126.4, 82.5, 26.5. HRMS (ESI) *m/z* calcd for C₁₁H₁₄⁷⁹BrNNaO₂⁺ [M + Na⁺] 294.0100; found 294.0088.

N-tert-Butoxy-2-(4-nitrophenyl)acetamide (1ac). Following the general procedure A, amide 1ac was isolated as a light yellow solid. Yield: 1.58 g, 63%, mp. 131-132 °C. ¹H NMR (600 MHz, CDCl₃) δ (mixture of two rotamers) 8.19 (d, *J* = 7.9 Hz, 2H), 7.69 (br s, 1H), 7.48 (br s, 2H), 3.86 (s, 0.9H), 3.59 (s, 1.1H), 1.31 (s, 4H), 1.25 (s, 5H). ¹³C NMR (150 MHz, CDCl₃) δ (* denotes minor rotamer peaks) 168.5, 147.0, 142.5, 142.08*, 130.6*, 130.0, 123.6, 82.5, 82.12*, 40.0, 38.4*, 26.3. HRMS (ESI) *m/z* calcd for C₁₂H₁₆N₂NaO₄⁺ [M + Na⁺] 275.1002; found 275.0980.

N-(Dodecyloxy)benzamide (1ad). Following the general procedure A, amide 1ad was isolated as a white solid. Yield: 2.68 g, 88%, mp. 49-50 °C. ¹H NMR (600 MHz, CDCl₃) δ 7.74 (d, *J* = 7.2 Hz, 2H), 7.50 (t, *J* = 7.2 Hz, 1H), 7.41 (t, *J* = 7.2 Hz, 2H), 4.01 (t, *J* = 6.7 Hz, 2H), 1.73-1.67 (m, 2H), 1.35-1.23 (m, 18H), 0.88 (t, *J* = 7.0 Hz, 3H). ¹³C NMR (150 MHz, CDCl₃) δ 166.1, 132.0, 131.9, 128.7, 127.0, 31.9, 29.7, 29.6, 29.6, 29.6, 29.4, 29.4, 28.1, 25.9, 22.7, 14.1. HRMS (ESI) *m/z* calcd for C₁₉H₃₁NNaO₂⁺ [M + Na⁺] 328.2247; found 328.2216.

N-(**Dodecyloxy**)-2-(4-nitrophenyl)acetamide (1ae). Following the general procedure A, amide 1ae was isolated as a yellow solid. Yield: 1.63 g, 45%, mp. 91-92 °C. ¹H NMR (600 MHz, CDCl₃) δ (mixture of two rotamers) 8.20 (d, *J* = 8.5 Hz, 2H), 8.05 (br s, 1H), 7.47 (d, *J* = 8.5 Hz, 2H), 3.90 (s, 1H), 3.86 (s, 2H), 3.56 (s, 1H), 1.63 (s, 2H), 1.45-1.16 (m, 18H), 0.88 (t, *J* = 7.0 Hz, 3H). ¹³C NMR (150 MHz, CDCl₃) δ (* denotes minor rotamer peaks) 167.2, 147.1, 141.9, 130.5*, 130.1, 123.7, 78.0, 39.8, 38.3*, 31.9, 29.6, 29.6, 29.6, 29.5, 29.4, 29.3, 28.0, 25.8, 22.7, 14.1. N-tert-Butoxy-2,4,6-trimethylbenzamide (1ah). Following the general procedure B, amide 1ah was isolated as a white solid. Yield: 1.28 g, 55%, mp. 140-141 °C. ¹H NMR (600 MHz, CDCl₃) δ 7.77 (s, 1H), 6.84 (s, 2H), 2.32 (s, 6H), 2.27 (s, 3H), 1.36 (s, 9H). ¹³C NMR (150 MHz, CDCl₃) δ 169.4, 139.1, 135.2, 131.7, 128.2, 82.2, 26.6, 21.1, 19.3. HRMS (ESI) *m/z* calcd for C₁₄H₂₀NNaO₂⁺ [M + Na⁺] 258.1465; found 258.1425.

N-(Dodecyloxy)-2,4,6-trimethylbenzamide (1ai). Following the general procedure B, amide 1ai was isolated as a white solid. Yield: 2.01 g, 58%, mp. 51-52 °C. ¹H NMR (600 MHz, CDCl₃) δ 8.35 (s, 1H), 6.81 (s, 2H), 4.03 (t, *J* = 6.8 Hz, 2H), 2.27 (d, *J* = 7.5 Hz, 9H), 1.75-1.67 (m, 2H), 1.43-1.21 (m, 18H), 0.88 (t, *J* = 6.8 Hz, 3H). ¹³C NMR (150 MHz, CDCl₃) δ 167.6, 139.2, 135.3, 130.9, 128.2, 31.9, 29.7, 29.6, 29.6, 29.5, 29.4, 28.1, 25.8, 22.7, 21.1, 18.9, 14.1. HRMS (ESI) *m/z* calcd for C₂₂H₃₇NNaO₂⁺ [M + Na⁺] 370.2717; found 370.2710.

III. Conversion of Alkoxyamides 1 to Esters 2.

General Procedure C: A solution of 1 (1.0 mmol) and NBS (1.0 mmol) in toluene (10 mL) was stirred at the designated temperature. The reaction was monitored by TLC. After the reaction was completed, the reaction mixture was allowed to cool to room temperature and EA (20 mL) was added. The resulting mixture was washed with saturated aqueous $Na_2S_2O_3$ (10 mL). The organic layer was dried over anhydrous Na_2SO_4 , filtered and removed under reduced pressure. The residue was purified by flash column chromatography on silica gel.

Methyl 3,4-dimethoxybenzoate (2a).²¹ Following the general procedure C, **2a** was isolated as a white solid. Yield: 178 mg, 91%, mp. 57-58 °C (lit.²¹ 57-59 °C). ¹H NMR (600 MHz, CDCl₃) δ 7.68

(dd, *J* = 8.4, 1.7 Hz, 1H), 7.55 (d, *J* = 1.5 Hz, 1H), 6.89 (d, *J* = 8.4 Hz, 1H), 3.93 (d, *J* = 2.0 Hz, 6H), 3.90 (s, 3H).

Methyl 4-methoxybenzoate (2b).²² Following the general procedure C, **2b** was isolated as a white solid. Yield: 146 mg, 88%, mp. 47-48 °C. (lit.²² 47-49 °C). ¹H NMR (600 MHz, CDCl₃) δ 7.99 (d, J = 8.8 Hz, 2H), 6.91 (d, J = 8.8 Hz, 2H), 3.88 (s, 3H), 3.85 (s, 3H).

Methyl 4-bromobenzoate (2c).²¹ Following the general procedure C, **2c** was isolated as a white solid. Yield: 182 mg, 85%, mp. 73-74 °C (lit.²¹ 74-76 °C). ¹H NMR (600 MHz, CDCl₃) δ 7.90 (d, J = 8.5 Hz, 2H), 7.58 (d, J = 8.5 Hz, 2H), 3.91 (s, 3H).

Methyl 2-iodobenzoate (2d).²³ Following the general procedure C, **2d** was isolated as a light yellow oil. Yield: 199 mg, 76%. ¹H NMR (600 MHz, CDCl₃) δ 7.99 (dd, J = 7.9, 0.9 Hz, 1H), 7.80 (dd, J = 7.8, 1.6 Hz, 1H), 7.40 (td, J = 7.7, 1.0 Hz, 1H), 7.15 (td, J = 7.7, 1.7 Hz, 1H), 3.93 (s, 3H).

Methyl 4-chlorobenzoate (2e).²⁴ Following the general procedure C, 2e was was isolated as a light yellow oil. Yield: 102 mg, 60%. ¹H NMR (600 MHz, CDCl₃) δ 7.97 (d, *J* = 8.5 Hz, 2H), 7.41 (d, *J* = 8.5 Hz, 2H), 3.92 (s, 3H).

Methyl 4-fluorobenzoate (2f).²² Following the general procedure C, **2f** was isolated as a light yellow oil. Yield: 77 mg, 50%. ¹H NMR (600 MHz, CDCl₃) δ 8.09-8.03 (m, 2H), 7.11 (t, *J* = 8.6 Hz, 2H), 3.91 (s, 3H).

Methyl 2-nitrobenzoate (2g).²⁵ Following the general procedure C, **2g** was isolated as a light yellow oil. Yield: 110 mg, 61%, light yellow oil. ¹H NMR (600 MHz, CDCl₃) δ 7.91 (d, J = 8.0 Hz, 1H), 7.75 (dd, J = 7.6, 1.3 Hz, 1H), 7.68 (td, J = 7.5, 1.0 Hz, 1H), 7.64 (td, J = 7.8, 1.4 Hz, 1H), 3.93 (s, 3H).

Benzyl benzoate (2h).²⁶ Following the general procedure C, **2h** was isolated as a colorless oil. Yield: 159 mg, 75%. ¹H NMR (600 MHz, CDCl₃) δ 8.08 (d, *J* = 7.8 Hz, 2H), 7.55 (t, *J* = 7.4 Hz, 1H), 7.43 (dd, *J* = 15.4, 7.6 Hz, 4H), 7.38 (t, *J* = 7.4 Hz, 2H), 7.33 (t, *J* = 7.3 Hz, 1H), 5.36 (s, 2H).

Benzyl 3-methylbenzoate (2i).²⁷ Following the general procedure C, **2i** was isolated as a colorless oil. Yield: 140 mg, 62%. ¹H NMR (600 MHz, CDCl₃) δ 7.88 (d, *J* = 9.0 Hz, 2H), 7.45 (d, *J* = 7.6 Hz, 2H), 7.41-7.28 (m, 5H), 5.36 (s, 2H), 2.39 (s, 3H).

Benzyl 4-nitrobenzoate (2j).²⁸ Following the general procedure C, **2j** was isolated as a light yellow solid. Yield: 185 mg, 72%, mp. 81-82 °C (lit.²⁸ 82-83 °C). ¹H NMR (600 MHz, CDCl₃) δ 8.28 (d, J = 8.8 Hz, 2H), 8.24 (d, J = 8.8 Hz, 2H), 7.46 (d, J = 7.2 Hz, 2H), 7.43-7.37 (m, 3H), 5.41 (s, 2H).

Methyl thiophene-2-carboxylate (2k).²⁴ Following the general procedure C, **2k** was isolated as a light yellow oil. Yield: 89 mg, 63%. ¹H NMR (600 MHz, CDCl₃) δ 7.81 (dd, *J* = 3.7, 1.0 Hz, 1H), 7.55 (dd, *J* = 5.0, 0.9 Hz, 1H), 7.10 (dd, *J* = 4.7, 3.9 Hz, 1H), 3.89 (s, 3H).

Methyl cinnamate (21).²⁹ Following the general procedure C, **21** was isolated as a light yellow oil. Yield: 137 mg, 85%. ¹H NMR (600 MHz, CDCl₃) δ 7.70 (d, J = 16.0 Hz, 1H), 7.52 (dd, J = 6.4, 2.7 Hz, 2H), 7.42-7.35 (m, 3H), 6.44 (d, J = 16.0 Hz, 1H), 3.81 (s, 3H).

4-Methoxybenzyl cinnamate (2m).³⁰ Following the general procedure C, **2m** was isolated as a white solid. Yield: 163 mg, 61%, mp. 57-58 °C. ¹H NMR (600 MHz, CDCl₃) δ 7.71 (d, *J* = 16.0 Hz, 1H), 7.53-7.49 (m, 2H), 7.41-7.34 (m, 5H), 6.94-6.88 (m, 2H), 6.46 (d, *J* = 16.0 Hz, 1H), 5.19 (s, 2H), 3.82 (s, 3H).

The Journal of Organic Chemistry

Methyl 2-(4-methoxyphenyl)acetate (2n).³¹ Following the general procedure C, 2n was isolated as a light yellow oil. Yield: 95 mg, 53%. ¹H NMR (600 MHz, CDCl₃) δ 7.19 (d, J = 8.6 Hz, 2H), 6.88-6.84 (m, 2H), 3.79 (s, 3H), 3.68 (s, 3H), 3.57 (s, 2H).

Methyl 2-(4-nitrophenyl)acetate (20).³² Following the general procedure C, **20** was isolated as a light yellow solid. Yield: 140 mg, 72%, mp. 48-49 °C (lit.³² 46-48 °C). ¹H NMR (600 MHz, CDCl₃) δ 8.20 (d, J = 8.5 Hz, 2H), 7.46 (d, J = 8.4 Hz, 2H), 3.74 (s, 2H), 3.73 (s, 3H).

Benzyl 2-(4-fluorophenyl)acetate (2p).³³ Following the general procedure C, **2p** was isolated as a light yellow oil. Yield: 175 mg, 72%. ¹H NMR (600 MHz, CDCl₃) δ 7.37-7.29 (m, 5H), 7.24 (dd, J = 8.3, 5.2 Hz, 2H), 7.00 (t, J = 8.7 Hz, 2H), 5.13 (s, 2H), 3.64 (s, 2H).

3-Nitrobenzyl octanoate (2q). Following the general procedure C, **2q** was isolated as a light yellow oil. Yield: 212 mg, 76%. ¹H NMR (600 MHz, CDCl₃) δ 8.23 (s, 1H), 8.19 (d, *J* = 8.2 Hz, 1H), 7.68 (d, *J* = 7.6 Hz, 1H), 7.55 (t, *J* = 7.9 Hz, 1H), 5.20 (s, 2H), 2.39 (t, *J* = 7.5 Hz, 2H), 1.69-1.64 (m, 2H), 1.32-1.25 (m, 8H), 0.87 (t, *J* = 6.8 Hz, 3H). ¹³C NMR (150 MHz, CDCl₃) δ 173.4, 148.4, 138.3, 133.8, 129.5, 123.1, 122.8, 64.6, 34.2, 31.6, 29.1, 28.9, 24.9, 22.6, 14.0. HRMS (ESI) *m/z* calcd for C₁₅H₂₁NNaO₄⁺ [M + Na⁺] 302.1363; found 302.1333.

Benzyl 2-chloroacetate (2r).³⁴ Following the general procedure C, **2r** was isolated as a colorless oil. Yield: 79 mg, 43%. ¹H NMR (600 MHz, CDCl₃) δ 7.39-7.33 (m, 5H), 5.22 (s, 2H), 4.10 (s, 2H).

tert-Butyl 3,4-dimethoxybenzoate (2aa).³⁵ Following the general procedure C, 2aa was isolated as a colorless oil. Yield: 200 mg, 84%. ¹H NMR (600 MHz, CDCl₃) δ 7.62 (dd, J = 8.4, 1.8 Hz, 1H), 7.52 (d, J = 1.8 Hz, 1H), 6.86 (d, J = 8.4 Hz, 1H), 3.93 (d, J = 1.9 Hz, 6H), 1.59 (s, 9H).

tert-Butyl 4-bromobenzoate (2ab).³⁶ Following the general procedure C, 2ab was isolated as a light yellow oil. Yield: 128 mg, 50%. ¹H NMR (600 MHz, CDCl₃) δ 7.84 (d, J = 8.4 Hz, 2H), 7.55 (d, J = 8.4 Hz, 2H), 1.59 (s, 9H).

tert-Butyl 2-(4-nitrophenyl)acetate (2ac).³⁷ Following the general procedure C, 2ac was isolated as a light yellow oil. Yield: 166 mg, 70%. ¹H NMR (600 MHz, CDCl₃) δ 8.19 (d, *J* = 8.6 Hz, 2H), 7.45 (d, *J* = 8.5 Hz, 2H), 3.64 (s, 2H), 1.45 (s, 9H).

Dodecyl benzoate (2ad).³⁸ Following the general procedure C, **2ad** was isolated as a colorless oil. Yield: 261 mg, 90%. ¹H NMR (600 MHz, CDCl₃) δ 8.05 (d, *J* = 7.9 Hz, 2H), 7.55 (t, *J* = 7.4 Hz, 1H), 7.44 (t, *J* = 7.7 Hz, 2H), 4.31 (t, *J* = 6.7 Hz, 2H), 1.81-1.72 (m, 2H), 1.48-1.23 (m, 18H), 0.88 (t, *J* = 7.0 Hz, 3H).

Dodecyl 2-(4-nitrophenyl)acetate (2ae). Following the general procedure C, **2ae** was isolated as a yellow solid. Yield: 261 mg, 75%, mp. 46-47 °C. ¹H NMR (600 MHz, CDCl₃) δ 8.19 (d, J = 8.4 Hz, 2H), 7.46 (d, J = 8.4 Hz, 2H), 4.11 (t, J = 6.7 Hz, 2H), 3.73 (s, 2H), 1.61 (dd, J = 13.5, 6.7 Hz, 2H), 1.27 (d, J = 16.1 Hz, 18H), 0.88 (t, J = 6.9 Hz, 3H). ¹³C NMR (150 MHz, CDCl₃) δ 170.2, 147.2, 141.5, 130.3, 123.7, 65.6, 41.1, 31.9, 29.6, 29.6, 29.5, 29.3, 29.2, 28.5, 25.8, 22.7, 14.1. HRMS (ESI) *m/z* calcd for C₂₀H₃₁NNaO₄⁺ [M + Na⁺] 372.2145; found 372.2118.

Methyl 2,4,6-trimethylbenzoate (2af).³⁹ Following the general procedure C, 2af was isolated as a colorless oil. Yield: 151 mg, 85%. ¹H NMR (600 MHz, CDCl₃) δ 6.84 (s, 2H), 3.89 (s, 3H), 2.28 (d, J = 3.5 Hz, 9H).

Methyl adamantan-1-carboxylate (2ag).⁴⁰ Following the general procedure C, **2ag** was isolated as a colorless oil. Yield: 165 mg, 85%. ¹H NMR (600 MHz, CDCl₃) δ 3.65 (s, 3H), 2.01 (s, 3H), 1.89 (d, J = 2.1 Hz, 6H), 1.71 (q, J = 12.2 Hz, 6H).

The Journal of Organic Chemistry

tert-Butyl 2,4,6-trimethylbenzoate (2ah).⁴¹ Following the general procedure C, 2ah was isolated as a colorless oil. Yield: 154 mg, 70%. ¹H NMR (600 MHz, CDCl₃) δ 6.83 (s, 2H), 2.30 (d, J = 2.5 Hz, 6H), 2.26 (s, 3H), 1.59 (dd, J = 1.9, 1.3 Hz, 9H).

Dodecyl 2,4,6-trimethylbenzoate (2ai). Following the general procedure C, **2ai** was isolated as a colorless oil. Yield: 278 mg, 84%. ¹H NMR (600 MHz, CDCl₃) δ 6.85 (s, 2H), 4.30 (t, *J* = 6.7 Hz, 2H), 2.28 (d, *J* = 8.1 Hz, 9H), 1.77-1.69 (m, 2H), 1.32-1.26 (m, 18H), 0.88 (t, *J* = 6.9 Hz, 3H). ¹³C NMR (150 MHz, CDCl₃) δ 170.3, 139.1, 135.0, 131.3, 128.4, 65.0, 31.9, 29.7, 29.6, 29.5, 29.4, 29.3, 28.7, 26.1, 22.7, 21.1, 19.7, 14.1. HRMS (ESI) *m/z* calcd for C₂₂H₃₆NaO₂⁺ [M + Na⁺] 355.2608; found 355.2575.

tert-Butyl adamantane-1-carboxylate (2aj).⁶ Following the general procedure C, 2aj was isolated as a colorless oil. Yield: 99 mg, 42%. ¹H NMR (600 MHz, CDCl₃) δ 1.99 (s, 3H), 1.83 (s, 6H), 1.69 (q, J = 12.4 Hz, 6H), 1.42 (d, J = 3.5 Hz, 9H).

IV. Formation of Dimer 3c and Its Thermal Decomposition.

A solution of 1c (1.0 mmol) and NBS (1.0 mmol) in toluene (10 mL) was stirred at room temperature for 1 h. Then EA (20 mL) was added and the mixture was washed with saturated aqueous Na₂S₂O₃ (10 mL). The organic layer was dried over anhydrous Na₂SO₄, filtered and removed under reduced pressure to give a white solid **3c** in quantitative yield. ¹H NMR (600 MHz, CDCl₃) δ 7.55 (s, 8H), 3.87 (s, 6H). ¹³C NMR (150 MHz, CDCl₃) δ 168.8, 131.6, 130.8, 130.2, 127.2, 63.6. HRMS (ESI) *m/z* calcd for C₁₆H₁₄⁷⁹Br₂N₂NaO₄⁺ [M + Na⁺] 478.9213; found 478.9200.

A solution of 3c (1.0 mmol) in toluene (5 mL) was stirred at 80 °C for 1 h. Then the solvent was removed under reduced pressure. The residue was purified by flash column chromatography on silica gel to afford 2c in 90% yield.
