ABSTRACT

Polymer-supported phenyliodine *bis*(trifluoroacetate) was prepared and used in the regeneration of carbonyl function from carbonyl derivatives.

In this communication, we wish to report our results concerning the preparation and synthetic application of polymer-supported phenyliodine *bis*(trifluoroacetate) (PPIB).¹

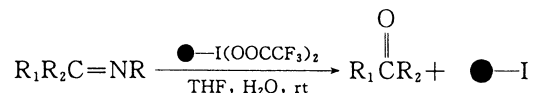

Phenyliodine *bis*(trifluoroacetate) (PIB), which is more reactive than phenyliodine diacetate (PID), has found wide synthetic utility as effective oxidizer. For the preparation of PIB, a practical method involves the ligand – exchange reaction of PID with trifluoroacetic acid.² Thus, an access

*Corresponding author.

to PPIB might be provided by translation of this conversion into a polymeric version. We first prepared PPID by our previously reported method³ and subsequently treated it with trifluoroacetic acid. The resulting resin was characterised by IR to observe the desired functional conversion. As a result, the shift of carbonyl adsorption peaks from 1645 cm^{-1} to 1680 cm^{-1} , which corresponds exactly to the same spectroscopic feature of PID and PIB respectively, clearly indicated the successful preparation of the expected PPIB. Meanwhile, the resin was assayed by iodometry and offered a 2.10 mmol/g capacity of functional group.

To exploit the useful oxidative property of the prepared resin, it was employed to effect the transformation of ketonic carbonyl derivatives to their parent ketones. Recent advances in hypervalent iodine chemistry have revealed that phenyliodine dicarboxylates serve as efficient tools for this conversion under mild and non acidic condition.⁴

In fact, stirring a mixture of PPIB and carbonyl derivatives of ketones in aqueous THF at room temperature readily achieved the oxidative regeneration of carbonyl function in substrate molecules. The reaction offered mild condition, simple manipulation, high yield and general applicability to phenylhydrazones, oximes, semicarbazones and tosylhydrazones of aromatic or aliphatic ketones.

After the reaction, the resulting iodinated polystyrene was recovered by filtration and retreated with peracetic acid and trifluoroacetic acid. The regenerated PPIB possessed the same reactivity as the original one, since the oxidation reaction could be repeated without significant negative effect.

EXPERIMENTAL SECTION

All carbonyl derivatives were prepared by literature procedure⁵ and identified by mp.

Table 1. Regeneration of Ketones with PPIB

Entry	R ₁	R ₂	R	Time (min)	Yield ^{a,b} (%)
1	Ph	CH ₃	PhNH	40	83
2	Ph	CH ₃	PhNH	40	79 ^c
3	<i>p</i> -Cl-Ph	CH ₃	PhNH	45	86
4	<i>p</i> -Br-Ph	CH ₃	PhNH	45	85
5	<i>p</i> -CH ₃ -Ph	CH ₃	PhNH	45	91

15	-(CH ₂) ₅ -	/	NHTs	25	85

^aAll compounds were confirmed by IR, ¹H-NMR in comparison with authentic samples. ^bIsolated yields. ^cRegenerated PPIB was employed in this case.

Preparation of PPIB: To a mixture of 5 g PPID in 40 mL CH₂Cl₂, 5 g trifluoroacetic acid were added with stirring. The mixture gradually became a dark reddish solution, and stirring was continued overnight. Ether was then introduced to precipitate the polymer species. The resulting resin was separated by filtration, washed with ether and dried to give 5.3 g PPIB. IR (KBr): 2920, 1680, 1485, 1410, 1180, 1005, 820 cm⁻¹ functional capacity: 2.10 mmol/g.

General Oxidation Procedure: 1 g PPIB was dissolved in 10 mL THF, then 0.3 mL H₂O and 1 mmol carbonyl derivative were added. The mixture was stirred until no starting material was detected by TLC. H₂O (15 mL) was added to precipitate the spent polymer. After removal of the polymer specie by filtration, the filtrate was extracted with CH₂Cl₂ (10 mL × 3), then washed with 5% aq. Na₂CO₃ (10 mL × 2) and H₂O (10 mL × 2) respectively. The organic layer was dried with MgSO₄ and evaporated *in vacuo* to yield the desired ketones. Further purification would be achieved by plate chromatography if necessary.
