#### Abstract

The double cyclocondensation of symmetric pyridyl bis(oxoacids) $\mathbf{2 b}$ and $\mathbf{3} \mathbf{b}$ with $(R)$-phenylglycinol stereoselectively gave access to bis-phenylglycinol-derived oxazolopyrrolidine $\mathbf{9}$ and oxazolopiperidone 10, respectively. Application of the stereocontrolled cyclocondensation reaction to phenyl bis- $\gamma$-oxoacid $\mathbf{4 b}$ provided $\mathbf{1 1}$, which was converted to the corresponding enantiopure di(pyrrolidinyl)benzene 22. The absolute configuration of the new stereogenic centers generated in the key cyclocondenstion step was unambiguously established by X -ray crystallographic analysis.

## Introduction

Nitrogen-containing heterocycles, including pyrrolidines and piperidines, are found in a myriad of natural products and biologically active compounds. For this reason, synthetic chemists continue to be interested in the construction and functionalization of these heterocyclic cores. ${ }^{1}$

In this context, the synthetic potential of phenylglycinol-derived oxazolopyrrolidone and oxazolopiperidone lactams as chiral synthons has been demonstrated. ${ }^{2}$ They have been used in the enantioselective synthesis of a great structural variety of complex alkaloids and bioactive compounds embodying a pyrrolidine or a piperidine moiety with different substitution patterns.
These lactams are readily available in both enantiomeric series by a cyclocondensation reaction of the $(R)$ - or $(S)$-phenylglycinol with $\gamma$ - or $\delta$-oxoacid derivatives (Scheme 1).

Although this key reaction has received considerable attention over the years from several research groups, ${ }^{3}$ to the best of our knowledge there are no references in the literature to double aminoalcohol-induced cyclocondensation reactions.

In this paper, we report cyclocondensation reactions of aryl bis(oxoacid) derivatives with ( $R$ )-phenylglycinol and the subsequent removal of the chiral auxiliary to gain access to enantiopure aryl bis-substituted nitrogen heterocycles (Scheme 2).

## Results and discussion

## Synthesis of the starting aryl oxoacid and bis(oxoacid) derivatives 1-4

Ketoester $\mathbf{1 a}^{4}$ (Scheme 3) was prepared in $50 \%$ overall yield by a Negishi ${ }^{5}$ coupling of picolinoyl chloride ${ }^{6}$ and

3-ethoxy-3-oxopropylzinc bromide in the presence of $\left[\mathrm{Pd}\left(\mathrm{PPh}_{3}\right)_{4}\right]$ as the catalyst. ${ }^{7}$ A subsequent saponification led to acid $\mathbf{1 b}$.

The Negishi reaction was also used for the preparation of symmetric bis(oxoacids) $\mathbf{2 b}$ and $\mathbf{3 b}$. Thus, reaction of the commercially available 2,6-pyridinedicarbonyl dichloride with the required zinc bromide derivative, followed by alkaline hydrolysis of the intermediate oxoesters 2a and 3a, led to 2b and 3b in $59 \%$ and $67 \%$ overall yield, respectively.

A similar reaction from isophthaloyl dichloride gave bis(oxoester) 4a in low yield, probably as a consequence of the hygroscopicity of the starting material. However, the corresponding diacid $\mathbf{4 b}$ was obtained in $53 \%$ overall yield using a three step procedure: a Mannich reaction between 1,3-diacetylbenzene, dimethylamine hydrochloride and paraformaldehyde, followed by treatment of the resulting hydrochloride salt 5 with potassium cyanide and acid hydrolysis of dinitrile $6 .{ }^{8}$ This sequence was successfully applied on a multigram scale.

## Cyclocondensation reactions of oxoacids $\mathbf{1 b}-\mathbf{4 b}$ with ( $R$ )-phenylglycinol

Cyclocondensation of $\mathbf{1 b}$ with $(R)$-phenylglycinol took place in good yield and excellent stereoselectivity to give the bicyclic lactam 7, which bears a 2-pyridyl substituent at the angular position (Scheme 4). ${ }^{9}$ Similarly, cyclocondensation of the commercially available 3-benzoylpropionic acid with ( $R$ )-phenylglycinol gave lactam 8 in $95 \%$ yield. ${ }^{10}$ Gratifyingly, extrapolation of the reaction conditions to bis- $\gamma$-oxoacids $\mathbf{2 b}$ and $\mathbf{4 b}$, and to bis- $\delta$-oxoacid $\mathbf{3 b}$, led to the corresponding aryl bis-lactams $\mathbf{9 , 1 1}$ and $\mathbf{1 0}$ in acceptable yields. The reaction was highly stereoselective since only one diastereoisomer was produced.

## Stereochemical outcome of the cyclocondensation reactions

The relationship between the aryl substituent at the angular position and the C-3 phenyl substituent in the $(R)$-phenylglycinol moiety in lactams $\mathbf{7 - 1 1}$ was always cis.

Notably, the NMR spectra of aryl bis-cyclocondensed products 9 and $\mathbf{1 1}$ coincided with those of the mono-cyclocondensed analogues 7 and $\mathbf{8}$, thus indicating that the stereochemical outcome in both groups of compounds was the same. Consequently, $\mathbf{9}, \mathbf{1 0}$ and $\mathbf{1 1}$ present a $C_{2}$ symmetry axis. In the ${ }^{13} \mathrm{C}$ NMR spectrum of oxazolopiperidone $\mathbf{1 0}$, the $\mathrm{C}-2$ and the hemiaminal C are shielded as compared with oxazolopyrrolidones 7, 8,9 and 11 (3-5 and 67 ppm , respectively; Table 1). Having a pyridyl or a phenyl group as linker between both oxazolopyrrolidone nuclei does not represent any significant change in the chemical shift or multiplicity.

Table 1 shows diagnostic signals in the ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectra of compounds $\mathbf{7 - 1 1}$ (H-2 and $\mathrm{C}-2, \mathrm{H}-3$ and $\mathrm{C}-3$, and hemiaminal quaternary C).
The configuration of the stereogenic carbon atoms generated in the above cyclocondensation reactions was unambigously established by X-ray crystallographic analysis of bis-lactams 9 , 10, and 11 (Fig. 1).

The stereochemical outcome of these reactions can be accounted for by considering that the two initially formed oxazolidines $\mathbf{A}$ and $\mathbf{B}$ are in equilibrium through the corresponding imine. The subsequent irreversible lactamization occurs preferentially from the oxazolidine that allows a less hindered approach of the carboxy group to the nitrogen atom, that is, anti with respect to both phenyl groups (Fig. 2). ${ }^{11}$

Notably, theoretical calculations using ab initio [HF/6-31G(d)] and DFT [B3LYP/6-31G(d)] methods predicted that $\mathbf{8}$ is 2.6 and $2.3 \mathrm{kcal} \mathrm{mol}^{-1}$, respectively, more stable than its stereoisomer with the two phenyl rings in a trans relationship.

## Removal of the chiral auxiliary

The removal of the chiral auxiliary from phenylglycinol-derived oxazolopyrrolidones involves two steps: the reductive cleavage of the $\mathrm{C}-\mathrm{O}$ bond of the oxazolidine ring, and the removal of the 2-hydroxy-1-phenylethyl substituent (Scheme 5).

Scheme 5 Removal of the chiral auxiliary.

First of all, model studies were carried out upon the simple oxazolopyrrolidone derivative 8 (Scheme 6). Titanium(Iv) chloride/triethylsilane ${ }^{12}$ mediated the ring opening of $\mathbf{8}$ and the reduction of the resulting $N$-acyliminium intermediate, stereoselectively providing lactam $\mathbf{1 2}$ in $71 \%$ yield, with retention of the configuration at C-5.
Attempts to remove the 2-hydroxy-1-phenylethyl moiety of $\mathbf{1 2}$ with sodium in liquid ammonia met with failure; the cleavage of the endocyclic benzylic bond occurred instead affording the corresponding linear amide 12a. ${ }^{13}$ However, the chiral auxiliary was successfully removed by an alternative procedure. Thus,

Scheme 6 Reagents and conditions: (a) $\mathrm{Et}_{3} \mathrm{SiH}, \mathrm{TiCl}_{4}, \mathrm{CH}_{2} \mathrm{Cl}_{2}, \mathrm{rfx}, 20 \mathrm{~h}$, $71 \%$, 12; (b) $\mathrm{SOCl}_{2}$, THF, $15 \min 0^{\circ} \mathrm{C}$, rfx, $1.5 \mathrm{~h}, 93 \%$, 13; (c) DMF, DBU, $85^{\circ} \mathrm{C}, 5 \mathrm{~h}, 70 \%$, 14; (d) $5 \mathrm{M} \mathrm{H}_{2} \mathrm{SO}_{4}, \mathrm{Et}_{2} \mathrm{O}$, rfx, $20 \mathrm{~h}, 96 \%$, 15; (e) $\mathrm{LiAlH}_{4}$, THF, rt, 3 days, $81 \%, 16$.
conversion of the hydroxyl group of lactam $\mathbf{1 2}$ to its corresponding chloride $\mathbf{1 3}(93 \%)$ and subsequent $\beta$-elimination by treatment with DBU in DMF provided enamide 14 in $70 \%$ yield. Hydrolysis of the enamide was easily accomplished with $\mathrm{H}_{2} \mathrm{SO}_{4}$ to afford lactam 15 in nearly quantitative yield. ${ }^{14}$ Finally, reduction of $\mathbf{1 5}$ with $\mathrm{LiAlH}_{4}$ gave ( $S$ )-phenylpyrrolidine 16 in $81 \%$ yield.
The above procedure was then applied to bislactam 11 (Scheme 7). The chemoselective reductive opening of the oxazolidine rings of $\mathbf{1 1}$ by $\mathrm{Et}_{3} \mathrm{SiH}$ and $\mathrm{TiCl}_{4}$ led to a $2: 1$ mixture of $\mathbf{1 7}$ and

$-\mathrm{H}_{2} \mathrm{O}$

$18(90 \%)$. Attempts to exclusively prepare 17 using more drastic reaction conditions did not work, ${ }^{15}$ but a subsequent treatment of $\mathbf{1 8}$ under the same $\mathrm{TiCl}_{4} / \mathrm{Et}_{3} \mathrm{SiH}$ conditions led exclusively to 17. Transformation of the hydroxyl group into a chloride (19), followed by elimination with DBU as the base led to bis-enamide 20 ( $50 \%$ overall yield). The hydrolysis of $\mathbf{2 0}$ was performed in the best reaction conditions found for the model compound $\mathbf{1 4}$ ( 5 M $\mathrm{H}_{2} \mathrm{SO}_{4} / \mathrm{Et}_{2} \mathrm{O}$ ), leading to aryl bis-pyrrolidone 21 ( $63 \%$ ). Finally, the reduction of both amide groups gave the target enantiopure di(pyrrolidinyl)benzene 22 in good yield ( $74 \%$ ).

The stereochemistry of $\mathbf{1 8}$ and $\mathbf{2 1}$ was unequivocally confirmed by X-ray crystallographic analysis, which made it evident that the process occurs with retention of the configuration at the pyrrolidone 5-position (Fig. 3 and 4).

A comparison of the ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectra of compounds $\mathbf{1 2 - 1 6}$ and their bis analogues $\mathbf{1 7}$ and 19-22 showed basically the same set of peaks, indicating the presence of a $C_{2}$ symmetry axis in the latter.

## Structural considerations

The structural attractiveness of aryl bis derivatives 9-11, $\mathbf{1 8}$ and 21 deserves a description on their molecular conformations and crystal packings.

Compound 9 crystallizes as two independent molecules in the monoclinic $P 2_{1}$ space group (see Table 1 in the ESI for a summary of the crystal data and structure refinement parameters

of the five crystal structures described in this article $\ddagger$ ). The two bicyclic lactams linked to the pyridine ring present opposed twisting orientations resulting in approximate binary axes for both independent molecules $[\tau(\mathrm{N} 1-\mathrm{C} 2-\mathrm{C} 21-\mathrm{C} 22)=59.2(8)$, $\tau(\mathrm{N} 1-\mathrm{C} 6-$ $\mathrm{C} 61-\mathrm{C} 62=65.0(8), \tau(\mathrm{N} 1 \mathrm{~A}-\mathrm{C} 2 \mathrm{~A}-\mathrm{C} 21 \mathrm{~A}-\mathrm{C} 22 \mathrm{~A})=63.5(8), \tau(\mathrm{N} 1 \mathrm{~A}-$ C6A-C61A-C62A) $\left.=59.1(8)^{\circ}\right]$. Assuming $R$ chiralities for the C26 and C66 (and C26a and C66a) centres, C21 and C61 (and C21a and C61a) are also $R$ centres.

Compound 10 also crystallizes as two independent molecules in the orthorhombic $P 2_{1} 2_{1} 2_{1}$ space group but with a water molecule, thus constituting a hemihydrate form. The overall conformation and chiral centres are similar to those of compound 9 ( $\tau(\mathrm{N} 1-$ C2-C21-C22) $=73.6(12), \tau(\mathrm{N} 1-\mathrm{C} 6-\mathrm{C} 61-\mathrm{C} 62=80.7(10), \tau(\mathrm{N} 1 \mathrm{~A}-$ $\mathrm{C} 2 \mathrm{~A}-\mathrm{C} 21 \mathrm{~A}-\mathrm{C} 22 \mathrm{~A})=77.2(12), \tau(\mathrm{N} 1 \mathrm{~A}-\mathrm{C} 6 \mathrm{~A}-\mathrm{C} 61 \mathrm{~A}-\mathrm{C} 62 \mathrm{~A})=$ $\left.80.4(11)^{\circ}\right)$. The water molecule bridges the two independent molecules through the hydrogen bonds O1W-H1W $\cdots$ O69 ${ }^{\mathrm{i}} \mathrm{i}=$ $-\mathrm{x}+1 / 2,-\mathrm{y}+1, \mathrm{z}+1 / 2 ; d(\mathrm{O} \cdots \mathrm{O})=2.921(15) \AA)$ and $\mathrm{O} 1 \mathrm{~W}-$ $\mathrm{H} 2 \mathrm{~W} \cdots \mathrm{O} 25 \mathrm{~A}(d(\mathrm{O} \cdots \mathrm{O})=2.849(17) \AA)$.

Compound 11 crystallizes in the tetragonal $P 4_{1} 2_{1} 2$ space group, the asymmetric unit being a half a molecule, that becomes complete through a binary axis. The change of pyridine to benzene as a bridging group increases the twisting of the substituent bicyclic lactam $\left(\tau(\mathrm{C} 2-1-\mathrm{C} 11-\mathrm{C} 12)=99.4(3)^{\circ}\right)$. Chiral centres are as in 9 and $\mathbf{1 0}$.

Compound $\mathbf{1 8}$ crystallizes in the orthorhombic $P 2_{1} 2_{2} 2_{1}$ space group. In this case, the difference in the benzene substituent groups is also apparent in their different spatial orientation ( $\tau(\mathrm{C} 2-\mathrm{C} 1-$ $\left.\mathrm{C} 11-\mathrm{C} 12)=62.8(5), \tau(\mathrm{C} 2-\mathrm{C} 3-\mathrm{C} 31-\mathrm{C} 32)=110.9(5)^{\circ}\right) . \mathrm{C} 16, \mathrm{C} 31$ and C36 are $R$ centres while C11 is an $S$ centre. An intramolecular hydrogen bond links the ethoxy group with a carbonyl (O18$\mathrm{H} 18 \cdots \mathrm{O} 14, d(\mathrm{O} \cdots \mathrm{O})=2.631(6) \AA)$.

Compound 21 crystallizes in the monoclinic $P 2_{1}$ space group. Here, the benzene substituent groups are similarly oriented ( $\tau(\mathrm{C} 1-$ C6-C61-C65) $\left.=-103.1(6), \tau(\mathrm{C} 1-\mathrm{C} 2-\mathrm{C} 21-\mathrm{C} 25)=-105.7(7)^{\circ}\right)$ and C21 and C61 centres have $S$ chirality. The molecules pack in infinite one-dimensional chains along [110] and [1-10] directions through the $\mathrm{N} 22-\mathrm{H} 22 \ldots \mathrm{O} 63^{\mathrm{ii}}$ (ii $=\mathrm{x}-1$, y -1 , z; $d(\mathrm{O} \cdots \mathrm{O})=$ $2.928(6) \AA$ ) and N62-H62 $\cdots \mathrm{O} 23^{\text {iii }}(\mathrm{iii}=\mathrm{x}+1, \mathrm{y}+1, \mathrm{z} ; d(\mathrm{O} \cdots \mathrm{O})=$ $2.952(6) \AA)$ hydrogen bonds.

## Summary

The bis-cyclocondensation reaction of $(R)$-phenylglycinol with aryl bis(oxoacid) compounds $\mathbf{2 b}, \mathbf{3 b}$ and $\mathbf{4 b}$ stereoselectively led to aryl bis-bicyclic lactams $\mathbf{9 , 1 0}$ and 11. The stereochemical outcome of the cyclocondensation reactions has been rationalised taking into account that irreversible lactamization occurs from cisdiphenyl oxazolidine intermediate $\mathbf{B}$. The absolute configuration of $\mathbf{9}, \mathbf{1 0}$ and $\mathbf{1 1}$ was confirmed by X-ray crystallographic analysis. Finally, efficient cleavage of the phenylethanol moiety derived from phenylglycinol led to enantiopure di(pyrrolidinyl)benzene 22.
These new bicyclic heterocycles are attractive candidates for organocatalysts or ligands in metal coordination chemistry.

## Experimental

## General

All non-aqueous reactions were performed under inert atmosphere with dry, freshly distilled solvents using standard procedures. Drying of organic extracts during the work-up of reactions was performed over anhydrous $\mathrm{Na}_{2} \mathrm{SO}_{4}$ or $\mathrm{MgSO}_{4}$. Evaporation of solvents was accomplished with a rotatory evaporator. Thin layer chromatography was done on $\mathrm{SiO}_{2}$ (silica gel $60 \mathrm{~F}_{254}$ ), and the spots were located by UV or $1 \% \mathrm{KMnO}_{4}$ solution. Chromatography refers to flash column chromatography and was carried out on $\mathrm{SiO}_{2}$ (silica gel 60, 230-400 mesh). Melting points were determined in
a capillary tube and are uncorrected. Unless otherwise indicated, NMR spectra were recorded in $\mathrm{CDCl}_{3}$ at 300 or $400 \mathrm{MHz}\left({ }^{1} \mathrm{H}\right)$ and 75.4 or $100.6 \mathrm{MHz}\left({ }^{13} \mathrm{C}\right)$, and chemical shifts are reported in $\delta$ values downfield from TMS or relative to residual chloroform ( $7.26 \mathrm{ppm}, 77.0 \mathrm{ppm}$ ) as an internal standard. Data are reported in the following manner: chemical shift, multiplicity, coupling constant $(J)$ in hertz $(\mathrm{Hz})$, integrated intensity. Multiplicities are reported using the following abbreviations: $s$, singlet; $d$, doublet; t , triplet; q, quartet; m, multiplet; br s, broad signal.

## Ethyl $\boldsymbol{\gamma}$-oxo-2-pyridinebutanoate (1a)

Tetrakis(triphenylphosphine)palladium( 0 ) ( $250 \mathrm{mg}, 0.18 \mathrm{mmol}$ ) was added at r.t. to a solution of 3-ethoxy-3-oxopropylzinc bromide ( 36 mL of a 0.5 M solution in THF, 18 mmol ) in THF ( 40 mL ). Then, a solution of picolinoyl chloride ${ }^{6}(2.5 \mathrm{~g}$, $18 \mathrm{mmol})$ in THF ( 40 mL ) was added over a period of 5 min , and stirring was continued for 4 h at rt . The reaction was quenched by the addition of saturated aqueous $\mathrm{NH}_{4} \mathrm{Cl}$ and extracted with $\mathrm{Et}_{2} \mathrm{O}$. The combined organic extracts were dried and concentrated, and the resulting residue was chromatographed ( $4: 1$ hexane$\left.\mathrm{Et}_{2} \mathrm{O}\right)$ to afford $\mathbf{1 a}(1.8 \mathrm{~g}, 50 \%$ ) as a yellowish oil: IR (film) 1700 , 1734, 2800-3000 cm ${ }^{-1} ;{ }^{1} \mathrm{H}$ NMR ( $\left.\mathrm{CDCl}_{3}, 400 \mathrm{MHz}\right) \delta 1.26(\mathrm{t}, J=$ $\left.7.1 \mathrm{~Hz}, 3 \mathrm{H}, \mathrm{CH}_{3}\right), 2.76\left(\mathrm{t}, J=6.7 \mathrm{~Hz}, 2 \mathrm{H}, \mathrm{CH}_{2} \mathrm{CO}_{2}\right), 3.56(\mathrm{t}, J=$ $6.7 \mathrm{~Hz}, 2 \mathrm{H}, \mathrm{CH}_{2} \mathrm{CO}$ ), $4.16\left(\mathrm{q}, J=7.1 \mathrm{~Hz}, 2 \mathrm{H}, \mathrm{OCH}_{2}\right), 7.48$ (ddd, $J=7.8,4.7,1.2 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{H}-5), 7.84(\mathrm{td}, J=7.8,1.7 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{H}-4)$, $8.05(\mathrm{dt}, J=7.8,1.2 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{H}-3), 8.70(\mathrm{dm}, J=4.7 \mathrm{~Hz}, 1 \mathrm{H}$, H-6); ${ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}, 100.6 \mathrm{MHz}\right) \delta 14.2\left(\mathrm{CH}_{3}\right), 28.3\left(\mathrm{CH}_{2}\right.$, $\left.C \mathrm{H}_{2} \mathrm{CO}_{2}\right), 32.8\left(\mathrm{CH}_{2}, \mathrm{CH}_{2} \mathrm{CO}\right), 60.5\left(\mathrm{CH}_{2}, \mathrm{OCH}_{2}\right), 121.7(\mathrm{CH}$, C-3), $127.2(\mathrm{CH}, \mathrm{C}-5), 136.8(\mathrm{CH}, \mathrm{C}-4), 148.9(\mathrm{CH}, \mathrm{C}-6), 153.0$ (C, C-2), 172.8 (C, COO), 200.0 (C, CO); HRMS C ${ }_{11} \mathrm{H}_{14} \mathrm{NO}_{3}(\mathrm{M}+$ $\mathrm{H}^{+}$), 208.0968; found, 208.0971.

## $\gamma$-Oxo-2-pyridinebutanoic acid (1b)

A solution of oxoester $\mathbf{1 a}(1.5 \mathrm{~g}, 7.2 \mathrm{mmol})$ in $\mathrm{MeOH}(30 \mathrm{~mL})$ and 4 N aqueous $\mathrm{NaOH}(20 \mathrm{~mL})$ was stirred at rt overnight. The solvent was evaporated, and the resulting residue was dissolved in $\mathrm{H}_{2} \mathrm{O}$. The solution was acidified with 5 N aqueous $\mathrm{HCl}(\mathrm{pH}=3-4)$ and extracted with EtOAc and $\mathrm{CH}_{2} \mathrm{Cl}_{2}$. ## Theoretical calculations

Initial geometries were obtained using the PCMODEL program. ${ }^{18}$ Further geometry optimizations were carried out using the Gaussian 03 suite of programs on a Compaq HPC320 computer, ${ }^{19}$ at the Hartree-Fock (HF) level, ${ }^{20}$ and at the Becke's three-parameter hybrid functional with the Lee, Yang and Parr correlation functional (B3LYP) level, ${ }^{21}$ using the $6-31 \mathrm{G}(\mathrm{d})$ basis set. ${ }^{22}$ Analytical energy second derivatives were calculated at all optimized structures to confirm that these were minima.
