# Synthesis of thieno[2,3-b]quinoxalines from 2-haloquinoxalines 

Montserrat Armengol and John A. Joule *<br>Department of Chemistry, The University of Manchester, Manchester, UK M13 9PL

Received (in Cambridge, UK) 19th October 2000, Accepted 27th November 2000 First published as an Advance Article on the web 19th December 2000

The palladium(0)-catalysed coupling of 2-haloquinoxalines with alkynes, addition of one mol equivalent of bromine to the 2-alkynylquinoxalines thus produced and then reaction of the resulting dibromides with dipotassium trithiocarbonate produces thieno[2,3-b]quinoxalines.

## Introduction

In the course of our synthetic work connected with the cofactor of the oxomolybdoenzymes ${ }^{1}$ we have developed methods for the synthesis of unsymmetrically substituted 1,3-dithiole-2thiones. As part of that development work we exposed dibromide 3a to disodium trithiocarbonate ${ }^{2}$ anticipating ${ }^{3}$ formation of a 4-quinoxalinyl-1,3-dithiole but found that it was converted instead (Scheme 1) in high yield into thieno[2,3-b]quinoxaline

4a
Scheme 1
4a. ${ }^{4}$ We have now had the opportunity to investigate this ring closing process in a broader context and find that it is a general and efficient process for the construction of tricycles 4 (Scheme 2 and Table 1).

Previously described ring syntheses of tricyclic thieno-[2,3-b]quinoxalines have all utilised 2,3-disubstituted quinoxalines as starting materials, and in most instances have been illustrated only with a limited number of examples. Thus, 2-chloro-3-formylquinoxaline reacts with ethyl thioglycolate to give 2-ethoxycarbonylthieno[2,3-b]quinoxaline, ${ }^{5} 2$ -chloro-3-cyanoquinoxaline with the same reactant produces the 3 -amino-2-ester, ${ }^{6} 3$-cyanoquinoxaline- $2(1 \mathrm{H})$-thione reacts with 2-bromoketones to give 3-amino-2-acyl- derivatives, ${ }^{7}$ 3-alkenylquinoxalin-2 $(1 \mathrm{H})$-ones and 3 -acylmethylquinox-alin- $2(1 \mathrm{H})$-ones react with phosphorus pentasulfide giving 2-alkylthieno[2,3-b]quinoxalines, ${ }^{8}$ certain 3-thioacylmethyl-quinoxalin- $2(1 H)$-ones ring-close in acid and produce 2 -arylthieno[2,3-b]quinoxalines, ${ }^{9}$ and finally, 2 -chloro-3alkynylquinoxalines react with disodium sulfide generating 2 -substituted thieno[2,3-b]quinoxalines. ${ }^{10}$ It was reported that thieno[2,3-b]quinoxaline itself was formed in $5 \%$ yield on exposure of 3-phenylamino-2-nitrothiophene to iron(II) oxalate. ${ }^{11}$

## Results and discussion

Our route (Scheme 2) begins with the construction of a

2-alkynylquinoxaline 2 by a cross coupling reaction. As quinoxaline coupling partner we have utilised 2-chloroquinoxaline 1a, prepared from quinoxalin- $2(1 H)$-one using phosphoryl chloride, ${ }^{12}$ 2-iodoquinoxaline 1b easily prepared from the chloro compound using hydrogen iodide in hot butanone, ${ }^{13}$ and 2,6-dichloroquinoxaline ${ }^{14}$ 1c which reacted selectively in the desired sense. The second step involves addition of bromine to the triple bond in 2, in most instances producing just one stereoisomer, assumed to be the $E$-isomer 3 shown, in some cases accompanied by the $Z$-isomer. In no instance were these separated and yields suggest that both isomers take part in the final stage of the synthesis which involves reaction of the dibromides 3 with disodium trithiocarbonate to give the tricyclic products 4 . In products 4 the typically low field quinoxaline 2 -proton of the precursors was no longer present, replaced by a singlet signal for the thiophene ring proton ( $\mathrm{H}-3$ ): this appeared in the range $\delta 7.17-7.30$ for 2-alkylthieno[2,3-b]quinoxalines and in the range $\delta 7.60-7.98$ for 2 -arylthieno[2,3-b]quinoxalines.

We began our investigation into the scope of the thieno-[2,3-b]quinoxaline ring forming process, its precedent being the formation of $\mathbf{4 a}$ from 3a, by examining the synthesis of other 2-alkylthieno[2,3-b]quinoxalines. Using bis(triphenylphosphine)palladium(II) chloride, copper(I) iodide and triethylamine, alkynes 2b and 2c were readily prepared from 2-iodoquinoxaline 1b and hex-1-yne and 3,3-dimethylbut-1yne, respectively. We found that the combination palladium(II) acetate, copper(I) iodide and triphenylphosphine is superior for the coupling of 2 -chloroquinoxalines and using these conditions $2 \mathbf{d}$ was prepared from 2,6-dichloroquinoxaline 1c and hex-1-yne. Addition of bromine to the hindered 2c was the only instance in all of our studies in which reaction in refluxing dichloromethane was required, other additions taking place smoothly at room temperature. Finally, aqueous ethanolic disodium trithiocarbonate ${ }^{2}$ converted the dibromides $\mathbf{3 b}, \mathbf{3 c}$, and $\mathbf{3 d}$ into the cyclised products $\mathbf{4 b}, \mathbf{4 c}$, and $\mathbf{4 d}$ respectively.

We suggest that for all the ring closures described in this paper the mechanistic sequence set out in Scheme 3 operates. Thus, addition of the trithiocarbonate anion at that position on the side-chain which is conjugated with the ring imine unit generates 5. Next, we envisage an intramolecular cyclising addition of sulfur to the quinoxaline 3-position, with loss of carbon disulfide and subsequent, or synchronous expulsion of bromide as suggested by the arrows on $\mathbf{5}$. Finally, rearomatisation as shown by the arrows on $\mathbf{6}$ by loss of hydrogen bromide leads to the observed products 4 .

In the hope that the route could be modified to allow synthesis of 2 -unsubstituted thieno[2,3-b]quinoxalines, 2-chloroquinoxaline 1a and 2,6-dichloroquinoxaline 1 c were coupled with trimethylsilylacetylene giving $\mathbf{2 e}$ and $\mathbf{2 f}$ and each of these desilylated with potassium carbonate in methanol forming $\mathbf{2 g}$ and $\mathbf{2 h}$. Working in the 6 -chloro-series, bromine addition to $2 \mathbf{f}$

was shown to be unexceptional giving 3e, desilylation of this affording 3 . Unfortunately, the cyclising thiophene ringforming process failed with both of the dibromo substrates $\mathbf{3 e}$ and $\mathbf{3 f}$.

Next we examined the formation of 2-arylthieno[2,3-b]quinoxalines. Using the coupling conditions appropriate for 2 -iodo- and 2 -chloroquinoxalines (discussed above), 2-alkynylquinoxalines $2 \mathbf{i}-\mathbf{2 n}$ were prepared using the corresponding arylalkynes. ${ }^{15}$ 2-Ethynylquinoxaline $\mathbf{2 g}$ (see above) was utilised
for the synthesis of 4-iodophenyl derivative $\mathbf{2 0}$ by coupling to 1,4 -diiodobenzene, and for the synthesis of $\mathbf{2 p}$ by cross coupling with 2-iodo-5-trifluoromethylpyridine, prepared from the commercial 2-chloro-5-trifluoromethylpyridine by reaction with sodium iodide in refluxing aqueous hydriodic acid.
Addition of bromine to alkynes 2i-2p then produced 1,2dibromoalkenes $\mathbf{3 g}-\mathbf{3 n}$ respectively. Dibromides $\mathbf{3 g}-\mathbf{3 j}$, 31-3n reacted smoothly and efficiently with disodium trithiocarbonate to give the 2 -arylthieno $[2,3-b] q u i n o x a l i n e s ~ 4 e-4 h$,

Scheme 3
and $\mathbf{4 k} \mathbf{- 4 m}$ respectively. In the case of the 4 -nitrophenyl substrate $\mathbf{3 k}$, partial reduction of the nitro group occurred during the ring closure process and a separable mixture of 4-nitro-phenyl- and 4 -aminophenylthieno[2,3-b]quinoxalines $\mathbf{4 i}$ and $\mathbf{4 j}$ was obtained.

Future work will seek to enlarge on the process described in this paper, looking for example to the possibility of producing 2 -side-chain functionalised thieno[2,3-b]quinoxalines, and to the possible use of quinoline, isoquinoline, pyrazine, pyrimidine, or pyridazine substrates instead of quinoxalines.

## Experimental

## General

Thin layer chromatography was carried out on Merck silica gel $\mathrm{F}_{254} 0.255 \mathrm{~mm}$ plates, and spots were visualised, where appropriate, by ultraviolet fluorescence at 254 or 297 nm . Flash column chromatography was performed using Merck Kiesel gel 60 (230-400 mesh). Tetrahydrofuran was dried by distillation from potassium-benzophenone; dichloromethane was dried by
distillation from calcium hydride. All other chemicals were purified using standard procedures as required. Organic solutions were dried over anhydrous magnesium sulfate. IR spectra were recorded on an ATI Mattson Genesis Series FTIR spectrometer and are given in $\mathrm{cm}^{-1} .{ }^{1} \mathrm{H}$-NMR spectra were recorded on a Varian AC 300E NMR spectrometer operating at 300 MHz . All chemical shifts are reported in parts per million downfield from tetramethylsilane. Peak multiplicities are denoted by s (singlet), br s (broad singlet), d (doublet), t (triplet), q (quartet) and m (multiplet) or by a combination of these e.g. dd (double doublet), with coupling constants ( $J$ ) given in $\mathrm{Hz} .{ }^{13} \mathrm{C}$-NMR spectra were recorded on a Bruker AC 300 spectrometer operating at 75 MHz . Mass spectra were recorded on a Fisons VG Trio 2000 for electron impact (EI) and chemical ionisation (CI) modes. Accurate mass measurements were made on a Kratos Concept. Melting points were recorded on a Reichert heated stage microscope and are uncorrected. Petroleum ether refers to the fraction bp $40-60^{\circ} \mathrm{C}$. Solutions were degassed by bubbling nitrogen through them for 10 min .

## Typical coupling using 2-iodoquinoxaline to give 2

2-(Phenylethynyl)quinoxaline 2i. A mixture of 2-iodoquinoxaline ( $512 \mathrm{mg}, 2 \mathrm{mmol}$ ), phenylacetylene ( $0.26 \mathrm{ml}, 2.4$ mmol ), bis(triphenylphosphine)palladium(II) chloride ( 36 mg ), copper( I ) iodide ( 16 mg ), and triethylamine ( 4 ml ) was heated at $60^{\circ} \mathrm{C}$ under nitrogen for 24 h . After evaporation of the triethylamine, the residue was diluted with 1 M hydrochloric acid and extracted with dichloromethane. The dried dichloromethane extract was evaporated and the residue purified by column chromatography, eluting with dichloromethane-petroleum ether ( $1: 1$ ) giving 2-(phenylethynyl)quinoxaline $\mathbf{2 i}(385 \mathrm{mg}$, $84 \%$ ) as a yellow oil; ${ }^{1} \mathrm{H}-\mathrm{NMR}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right): \delta 7.42$ $(3 \mathrm{H}, \mathrm{m}), 7.75(2 \mathrm{H}, \mathrm{m}), 7.82(2 \mathrm{H}, \mathrm{m}), 8.08(2 \mathrm{H}, \mathrm{m}), 9.05(\mathrm{~s}, 1 \mathrm{H})$; ${ }^{13} \mathrm{C}-\mathrm{NMR}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right): \delta 86.9,93.6,121.3,128.5,129.1$, 129.2, 129.7, 130.3, 130.6, 132.3, 139.5, 140.8, 142.1, 147.2; MS (EI): $m / z 230\left(\mathrm{M}^{+}, 88 \%\right), 127$ (80), 76 (100).

## Typical coupling using 2-chloroquinoxalines to give 2

6-Chloro-2-(hex-1-yn-1-yl)quinoxaline 2d. To a degassed solution of 2,6-dichloroquinoxaline $(1.5 \mathrm{~g}, 7.5 \mathrm{mmol})$ and hex-1-yne $(0.57 \mathrm{ml}, 9.75 \mathrm{mmol})$ in acetonitrile $(40 \mathrm{ml})$ and triethylamine $(7.5 \mathrm{ml})$, palladium(II) acetate $(130 \mathrm{mg})$, copper(I) iodide (182 $\mathrm{mg})$, and triphenylphosphine $(200 \mathrm{mg})$ were added under nitrogen. The mixture was heated at $60^{\circ} \mathrm{C}$ for 6 h . After evaporation of the solvent, the residue was diluted with water and extracted with dichloromethane. The dried organic extract was evaporated and the residue purified by column chromatography, eluting with petroleum ether-diethyl ether $(9: 1)$ to give 6-chloro-2-(hex-1-yn-1-yl)quinoxaline 2d (944 mg, 54\%) as a brown solid, $\operatorname{mp} 42-43{ }^{\circ} \mathrm{C} ;{ }^{1} \mathrm{H}-\mathrm{NMR}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right): \delta 1.02$ $(3 \mathrm{H}, \mathrm{t}, J=6.9 \mathrm{~Hz}), 1.55(2 \mathrm{H}, \mathrm{m}), 1.71(2 \mathrm{H}, \mathrm{m}), 2.58(2 \mathrm{H}, \mathrm{t}$, $J=7.0 \mathrm{~Hz}), 7.73(1 \mathrm{H}$, dd, $J=8.9$ and 2.3 Hz$), 7.90(1 \mathrm{H}, \mathrm{d}$, $J=8.9 \mathrm{~Hz}), 8.08(1 \mathrm{H}, \mathrm{d}, J=2.3 \mathrm{~Hz}), 8.85(1 \mathrm{H}, \mathrm{s}) ;{ }^{13} \mathrm{C}-\mathrm{NMR}$ ( $300 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta 13.5,19.2,22.0,30.0,78.6,96.9,128.0$, 130.1, 131.4, 135.7, 140.0, 140.5, 140.8, 148.1; MS (CI): m/z 247 $\left([\mathrm{M}+\mathrm{H}]+,{ }^{+} \mathrm{Cl}, 30 \%\right), 245\left([\mathrm{M}+\mathrm{H}]{ }^{+},{ }^{35} \mathrm{Cl}, 100 \%\right), 76(100)$.

## Typical couplings with 2-ethynylquinoxaline to give 2

(a) 2-(4-Iodophenylethynyl)quinoxaline 20. To a degassed solution of 2-ethynylquinoxaline ( $492 \mathrm{mg}, 3.2 \mathrm{mmol}$ ) and 1,4diiodobenzene $(5.3 \mathrm{~g}, 16 \mathrm{mmol})$ in acetonitrile $(30 \mathrm{ml})$ and triethylamine $(15 \mathrm{ml})$, palladium(II) acetate ( $36 \mathrm{mg}, 0.16 \mathrm{mmol}$ ), copper( I ) iodide ( $61 \mathrm{mg}, 0.32 \mathrm{mmol}$ ), and triphenylphosphine $(84 \mathrm{mg}, 0.32 \mathrm{mmol})$, were added under nitrogen. The mixture was stirred under nitrogen at room temperature for 3 h . After evaporation, the residue was diluted with aqueous sodium bicarbonate and extracted with dichloromethane. The dried organic extract was evaporated and the residue purified by column chromatography, eluting with dichloromethane to yield 2-(4-iodophenylethynyl)quinoxaline $20(557 \mathrm{mg}, 49 \%)$ as a crystalline yellow solid, mp 146-149 ${ }^{\circ} \mathrm{C} ;{ }^{1} \mathrm{H}-\mathrm{NMR}(300 \mathrm{MHz}$, $\left.\mathrm{CDCl}_{3}\right): \delta 7.31(2 \mathrm{H}, \mathrm{d}, J=8.3 \mathrm{~Hz}), 7.67(2 \mathrm{H}, \mathrm{d}, J=8.3 \mathrm{~Hz}), 7.72$ $(2 \mathrm{H}, \mathrm{m}), 8.01(2 \mathrm{H}, \mathrm{m}), 8.88(1 \mathrm{H}, \mathrm{s}) ;{ }^{13} \mathrm{C}-\mathrm{NMR}(300 \mathrm{MHz}$, $\left.\mathrm{CDCl}_{3}\right): \delta 88.1,92.4,96.1,120.8,129.1,129.2,130.4,130.6$, $133.5,137.7,139.9,140.9,142.1,147.0 ; \mathrm{MS}$ (CI): m/z 357 $\left([\mathrm{M}+\mathrm{H}]^{+}, 100 \%\right)$. Further elution with dichloromethane-ethyl acetate (7:3) gave 1,4-bis(quinoxalin-2-ylethynyl)benzene (129 $\mathrm{mg}, 14 \%$ ), mp 262-263 ${ }^{\circ} \mathrm{C}$.
(b) 2-(5-Trifluoromethylpyridin-2-ylethynyl)quinoxaline $\mathbf{2 p}$. To a degassed solution of 2-ethynylquinoxaline $\mathbf{2 g}(500 \mathrm{mg}$, 3.24 mmol ), and 2-iodo-5-trifluoromethylpyridine ( $1.7 \mathrm{~g}, 6.48$ $\mathrm{mmol})$ in acetonitrile $(13 \mathrm{ml})$ and triethylamine $(6.5 \mathrm{ml})$, palladium(II) acetate ( $36 \mathrm{mg}, 0.16 \mathrm{mmol}$ ), copper(I) iodide ( 62 $\mathrm{mg}, 0.32 \mathrm{mmol}$ ), and triphenylphosphine ( $85 \mathrm{mg}, 0.32 \mathrm{mmol}$ ), were added under nitrogen. The mixture was stirred under nitrogen at room temperature for 3 h . After evaporation, the residue was diluted with aqueous sodium bicarbonate and extracted with dichloromethane. The dried organic extract was evaporated and the residue purified by column chromatography, eluting with dichloromethane-ethyl acetate $(95: 5)$ to yield 2-(5-trifluoromethylpyridin-2-ylethynyl)quinoxaline $\mathbf{2 p}$ ( $450 \mathrm{mg}, 30 \%$ ), as a yellow solid, $\mathrm{mp} 152-154^{\circ} \mathrm{C}$ (from methanol); ${ }^{1} \mathrm{H}-\mathrm{NMR}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right): \delta 7.75(3 \mathrm{H}, \mathrm{m}), 7.94$ $(1 \mathrm{H}, \mathrm{dd}, J=1.7$ and 7.7 Hz$), 8.06(2 \mathrm{H}, \mathrm{m}), 8.88(1 \mathrm{H}, \mathrm{s}), 9.01$ $(1 \mathrm{H}, \mathrm{s}) ;{ }^{13} \mathrm{C}-\mathrm{NMR}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right): \delta 87.8,90.1,127.5$, $129.3,129.4$ (2), 130.9, 131.7 (2), 133.5, 138.0, 141.3, 142.1, 145.2, 147.1 (2).

## Typical addition of bromine to give 3

2-(1,2-Dibromo-2-phenylethenyl)quinoxaline 3g. A solution of bromine $(0.36 \mathrm{ml}, 7.15 \mathrm{mmol})$ in dichloromethane $(10 \mathrm{ml})$ was added dropwise to a stirred solution of 2-(phenylethynyl)quinoxaline $2 \mathbf{i}(1.5 \mathrm{~g}, 6.5 \mathrm{mmol})$ dissolved in dichloromethane $(20 \mathrm{ml})$. The resultant mixture was stirred for 2 h at room
temperature. Addition of aqueous sodium metabisulfite and dichloromethane followed by separation, drying, and evaporation of the organic phase under reduced pressure gave a brown oil. Purification by column chromatography eluting with petroleum ether-ethyl acetate $(93: 7)$ gave the pure dibromoalkene $\mathbf{3 g}(1.99 \mathrm{~g}, 79 \%)$ as a yellow solid, $\mathrm{mp} 98-102^{\circ} \mathrm{C}$; ${ }^{1} \mathrm{H}-\mathrm{NMR}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right): \delta 7.50(3 \mathrm{H}, \mathrm{m}), 7.64(2 \mathrm{H}, \mathrm{m}), 7.90$ $(2 \mathrm{H}, \mathrm{m}), 8.22(2 \mathrm{H}, \mathrm{m}), 9.02(1 \mathrm{H}, \mathrm{s}) ;{ }^{13} \mathrm{C}-\mathrm{NMR}(300 \mathrm{MHz}$, $\mathrm{CDCl}_{3}$ ): $\delta 113.6,122.5,128.4,128.9,129.2,129.5,130.6,130.9$, 139.2, 141.5, 141.6, 145.2, 152.8; MS (CI): m/z 389, 391, 393 $\left([M+H]^{+}, 6,12,6 \%\right), 231(100)$.

## Typical ring closure to form thieno[2,3-b]quinoxalines 4

2-Phenylthieno[2,3-b]quinoxaline 4e. An aqueous solution of disodium trithiocarbonate ${ }^{2}(33 \%, 3 \mathrm{ml})$ was added to a hot solution of 2-(1,2-dibromo-2-phenylethenyl)quinoxaline $\mathbf{3 g}$ $(200 \mathrm{mg}, 0.51 \mathrm{mmol})$ in methanol $(8 \mathrm{ml})$ with stirring. The resulting solution was cooled to room temperature and stirred for a further 3 h . After evaporation of methanol, the residue was diluted with water and extracted with dichloromethane. The organic extract was dried and evaporated under reduced pressure to leave a brown oil. Purification by column chromatography over silica gel eluting with petroleum ether-diethyl ether $(2: 1)$ gave a red solid, which was further purified by treating with charcoal in dichloromethane to give the pure thienoquinoxaline $4 \mathrm{e}(71 \mathrm{mg}, 53 \%)$ as a yellow solid, $\mathrm{mp} 186-188^{\circ} \mathrm{C}$ (lit. ${ }^{8 b} \mathrm{mp} 185^{\circ} \mathrm{C}$ ).

## Typical desilylation

2-Ethynylquinoxaline $\mathbf{2 g}$. To a suspension of 2-(trimethylsilylethynyl)quinoxaline $2 \mathrm{e}(3 \mathrm{~g}, 13.2 \mathrm{mmol})$ in dry methanol $(34 \mathrm{ml})$ at room temperature was added potassium carbonate $(188 \mathrm{mg}, 1.32 \mathrm{mmol})$ under nitrogen and the mixture stirred for 1 h . The methanol was evaporated under reduced pressure and the residue dissolved in dichloromethane, the solution washed with water, dried, and evaporated under reduced pressure, to give a brown solid. Purification by column chromatography over silica gel eluting with dichloromethane gave 2-ethynylquinoxaline $2 \mathrm{~g}(1.8 \mathrm{~g}, 88 \%)$ as a white solid, $\mathrm{mp} 95-98^{\circ} \mathrm{C}$; ${ }^{1} \mathrm{H}-\mathrm{NMR}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right): \delta 3.30(1 \mathrm{H}, \mathrm{s}), 7.72(2 \mathrm{H}, \mathrm{m}), 8.05$ $(2 \mathrm{H}, \mathrm{m}), 8.82(1 \mathrm{H}, \mathrm{s}) ;{ }^{13} \mathrm{C}-\mathrm{NMR}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right): \delta 80.9$, 81.2, 129.1, 129.2, 130.6, 130.7, 138.3, 141.2, 141.9, 147.0; MS (CI): $m / z 155\left([\mathrm{M}+\mathrm{H}]^{+}, 100 \%\right)$.

## Acknowledgements

The work described in this paper was wholly funded by the Nissan Chemical Company, Tokyo, Japan, through a contact established and maintained by Dr Kenzi Makino of that company. We are most grateful to the Nissan Chemical Company for financial support and for a studentship (M. A.), and to Dr Makino for his interest in this work and for many stimulating chemical discussions and suggestions throughout our collaboration.

14 We thank the Nissan Chemical Company for a generous supply of 2,6-dichloroquinoxaline.
15 4-Methoxyphenylethyne and 4-chlorophenylethyne were prepared via coupling of trimethylsilylacetylene with 4-methoxy- and 4-chloroiodobenzene respectively followed by desilylation (R. Liu and T. T. Tidwell, J. Chem. Soc., Perkin Trans. 2, 1996, 2757; G. T. Crisp and B. L. Flynn, J. Org. Chem., 1993, 58, 6614; E.-i. Negishi and T. Takahashi, J. Am. Chem. Soc., 1986, 108, 3402). 4-Nitroand 3-nitrophenylethyne were prepared by condensation of the arylaldehyde with malonic acid, addition of bromine, and sequential eliminations of carbon dioxide and bromide and then hydrogen bromide (D. F. Delar, Org. Synth., 1963, Coll. Vol. IV, 731; C. P. Krimmel, L. E. Thielen, E. A. Brown and W. J. Heidtke, Org. Synth., 1962, Coll. Vol. IV, 961; E. R. Trumbull, R. T. Finn, K. M. IbneRase and C. K. Saunders, J. Org. Chem., 1962, 27, 2343 (we found sodium hydrogen carbonate to be preferable to sodium hydroxide for the decarboxylative debromination); A. D. Allen and C. D. Cook, Can. J. Chem., 1963, 41, 1085). We thank Miss Mélanie Liutkus, a student from the University of Montpellier, France, for preparing the nitroarylethynes during a work experience period in Manchester.
