

## SYNTHESIS OF [(THIAZOL-2-YLAMINO)- METHYLENE]BISPHOSPHONIC ACIDS

A. L. Chuiko<sup>1\*\*</sup>, L. P. Filonenko<sup>1</sup>, and M. O. Lozinskii<sup>1\*</sup>

*A method for the synthesis of [(thiazol-2-ylamino)methylene]bisphosphonic acids from (aminomethylene)-bisphosphonic acid through 3-N-unsubstituted (thioureidomethylene)bisphosphonic acid was proposed.*

**Keywords:** bisphosphonate, thiazole, cyclization.

Among bisphosphonate derivatives containing heterocycles biologically active compounds are found [1-3]. We have synthesized a series of 3-substituted (thiazol-2-ylaminomethylene)bisphosphonates [4, 5] with phytotoxic activity by the condensation of (thioureidomethylene)bisphosphonic acids with halo ketones. Biological activity has also been found for tetraesters of [(thiazol-2-yl)aminomethylene]bisphosphonic acids unsubstituted at the position N-3 synthesized by the condensation of aminothiazoles with triethyl orthoformate [7].

In the present work, we attempted to extend our method for the Hantzsch condensation to the synthesis of [(thiazolylamino)methylene]bisphosphonic acids unsubstituted at position N-3. (Thioureidomethylene)bisphosphonic acid **1** required for this reaction was synthesized by the acid-catalyzed decomposition of [(*tert*-butylthioureido)methylene]bisphosphonic acid **2**, which we obtained previously as the disodium salt from (aminomethylene)bisphosphonic acid **3** [8]. Since acid **2** is unstable in the free state, it was used *in situ* without separation from the reaction mixture. Acid **2** decomposes in hydrochloric acid with loss of the *tert*-butyl residue to give (thioureidomethylene)bisphosphonic acid **1**. This reaction proceeds under milder conditions than the decomposition described for *tert*-butylthiourea [9], which was carried out by heating in concentrated hydrochloric acid at reflux. However, the decomposition of acid **2** proceeds with formation of (aminomethylene)bisphosphonic acid **3** as a side product. The optimal conditions for the formation of desired acid **1** according to the <sup>31</sup>P NMR spectrum of the reaction mixture are obtained using 10% hydrochloric acid at 90°C. Under these conditions, the decomposition of acid **2** requires 10 min and leads to a mixture consisting of 83% of the desired acid **1** and 17% of the by-product acid **3**. An attempt to use concentrated hydrochloric acid led to a mixture of not readily identifiable side products. Acid **1** precipitated from the mixture as fine-crystalline mono-(triethylammonium) salt **4**, which is stable and can be stored under ordinary conditions without decomposition.

\*Deceased.

\*The  $^1\text{H}$  NMR spectra for compounds **5a,c,e,h,i,k,l** were taken in  $\text{DMSO-d}_6 + 2.5\% \text{Et}_3\text{N}$ , the spectra for compounds **5b,f,g** were taken in  $\text{DMSO-d}_6$ , and the spectrum for **5j** was taken in  $\text{D}_2\text{O} + \text{Na}_2\text{CO}_3$  (added until dissolution).

\*<sup>2</sup>The  $^1\text{H}$  NMR spectrum was taken in  $\text{DMSO-d}_6$ .

Salt **4** readily reacts with halo ketones in ethanolic solution to give rapidly crystallizing [(thiazol-2-ylamino)methylene]bisphosphonic acids **5a-l**.

Acids **5** are colorless, high-melting compounds, which decompose upon heating, have low solubility in  $\text{DMSO}$ , and are virtually insoluble in water, acetone, and alcohols. On the other hand, these acids readily dissolve in water in the presence of various bases or in  $\text{DMSO}$  with added triethylamine to give salts.

Thus, we have developed a method for the synthesis of (thioureidomethylene)bisphosphonic acid unsubstituted at position N-3 and for the conversion of this compound into [(thiazol-2-ylamino)-methylene]bisphosphonic acid.

## EXPERIMENTAL

The  $^1\text{H}$  NMR spectra were taken on a Varian VXR-300 spectrometer at 300 MHz with TMS as internal standard for the  $\text{DMSO-d}_6$  solutions. The chemical shifts for the solutions in  $\text{D}_2\text{O}$  are given relative to TMS as external standard.

**Triethylammonium Salt of (Thioureidomethylene)bisphosphonic Acid (4)** [8]. *t*-BuNCS (3 ml, 25 mmol) was added to a solution of (aminomethylene)bisphosphonic acid (**3**) (3.82 g, 20 mmol) in a mixture of methanol (50 ml), water (10 ml), and triethylamine (15 ml, 108 mmol) and left for 24 h at 60°C (heating the mixture to reflux leads to decomposition of the product). The mixture was evaporated under reduced pressure at

30°C to give a thick residue, which was dissolved in 60 ml water. The side products were extracted with ether (3×20 ml) and the solution was decolorized using activated carbon. Concentrated hydrochloric acid (10 ml) was added to the aqueous phase and heated for 10 min at 90°C. The mixture was evaporated in vacuum at 30°C to leave a thick residue, which was dissolved in 30 ml 2-propanol and left to crystallize for one week at 0°C. The colorless precipitate was filtered off and washed with 2-propanol. Salt **4**, which readily dissolves in water, was dried in vacuum at 30°C. <sup>1</sup>H NMR spectrum (DMSO-d<sub>6</sub>), δ, ppm (*J*, Hz): 1.17 (9H, t, *J* = 7.3, 3CH<sub>2</sub>CH<sub>3</sub>); 3.06 (6H, q, *J* = 7.3, 3CH<sub>2</sub>CH<sub>3</sub>); 3.99 (0.21H, td, <sup>2</sup>*J*<sub>P-H</sub> = 18.8, <sup>3</sup>*J* = 8.4) and 5.07 (0.79H, td, <sup>2</sup>*J*<sub>P-H</sub> = 20.5, <sup>3</sup>*J* = 9.8, CH); 6.14 (0.21H, m) and 8.84 (0.79H, m, NH); 7.32 (1H, br. s, NH); 9.94 (1H, s, NH).

**[(Thiazol-2-ylamino)methylene]bisphosphonic Acids 5a-l (General Method).** Corresponding chloro (for compounds **5c,d,h,i,k,l**) or bromo ketone (6-7 mmol) was added to a solution of compound **4** (1.76 g, 5 mmol) in methanol (10 ml) and heated under reflux for 10 min. The reaction mixture was cooled and 1 ml concentrated hydrobromic acid was added. The mixture was left at 0°C for 12 h for crystallization. The precipitate was filtered off, washed with methanol, and dried in the air.
