ABSTRACT: 2'-Aminoacetophenones undergo a $C(sp^3)$ -H oxidation and a following intramolecular C–N bond formation by virtue of a simply electrochemical oxidation in the presence of *n*-Bu₄NI, providing various isatins with moderate to good yields. The reaction intermediates were detected, and a radical-based pathway was proposed.

Isatins represent an important skeleton of heterocyclic compounds and widely exist in natural products and pharmaceuticals,¹ which were extensively used in various reactions in the past few decades.² As a result, substantial attention has been paid to the development of the preparation of isatins. Traditionally, the pioneering work of the synthesis of isatins were mainly developed by Sandmeyer,³ Stoll⁴ and Martinet.⁵ However, the scope of substrates and regioselectivity restricted the wide application of these methods. Recently, these methods have been gradually replaced by several improved protocols, including aryne-based methods,⁶ Sandmeyer modifications,⁷ sulfurylide mediated carbonyl homologation,⁸ metal-catalyzed oxidations⁹ and metal-free mediated domino reactions.¹⁰ For instance, Zhu et al and Wu et al developed copper-catalyzed synthesis of isatins from 2'-aminoacetophenones, utilizing O₂^{9c} and I₂^{9d} as oxidants, respectively. Although considerable progress has been made in these reported methodologies, metal catalyst, peroxides and elevated temperature were usually involved in most of these methods, resulting in concerns on the environmental impact. Therefore, a mild and green approach to synthesize various isatins is still attractive and valuable.

Electrochemical synthesis features sustainability and environmentally friendly properties, has been widely applied to construct all kinds of chemical bonds.^{11, 12} As part of our continuing interest in C–H functionalization under electrochemical conditions,¹³ we recently realized the synthesis of α -ketoamides,¹⁴ α -ketoesters,¹⁵ α -enaminones,¹⁶ β -enaminones¹⁷ and the difunctionalization of arylketones with malonate esters.¹⁸ Therefore, we envisaged that isatins may also be synthesized from 2'-aminoacetophenones via an electrochemically oxidative amidation of sp³ C–H bonds. Herein, we found that the electrochemically oxidative cyclization of 2'-aminoacetophenones could

The Journal of Organic Chemistry

be indeed conducted by using n-Bu₄NI as a redox catalyst and the reaction can be carried out smoothly at room temperature.

Initially, 1-(2-(benzylamino)phenyl)ethanone (1a) was chosen as the model substrate in an undivided cell equipped with a pair of platinum-plate electrodes $(1.5 \times 1.5 \text{ cm}^2)$ in the presence of KI as electrolyte and MeOH as solvent under an oxygen atmosphere. To our delight, the desired product 2a was obtained in 67% yield (Table 1, entry 1) after the electricity quantity of 14.9 F was consumed at room temperature. Later, other different supporting electrolytes, such as Me₄NI, Et₄NI, *n*-Bu₄NI, NaBr and LiClO₄, were examined in the reaction (Table 1, entries 2–6). All of the iodine salts could conduct this reaction smoothly while NaBr and LiClO₄ hardly worked for this reaction, which indicated that iodine salts were crucial for the reaction. Of the counterions, $n-Bu_4N^+$ gave a superior result than K^+ , Me_4N^+ or Et_4N^+ , perhaps due to a good solubility of *n*-Bu₄NI in MeOH.¹⁹ Then we screened the reaction current density, and a better yield was obtained when the current density was 8.9 mA/cm² (Table 1, entries 4 vs 7 and 8). After testing various solvents, it was found that MeOH was the best solvent. When other solvents were employed, the yield of the desired product decreased sharply, and only a trace amount of product was detected through thin layer chromatography (TLC) analysis and the ¹H-NMR of the reaction mixture (Table 1, entries 9-12). Other types of electrodes were also examined. The experimental results indicated that the Pt/Pt electrode was the best electrode couple in this reaction (Table 1, entries 13-15). In addition, when the reaction was performed under air atmosphere instead of oxygen atmosphere, the reaction yield was sharply decreased from 84% to 25%, which implied that the oxygen atmosphere was crucial on this transformation (Table 1, entry 16). After investigation, conditions follows: the optimal reaction were summarized as

2'-aminoacetophenones (0.5 mmol), *n*-Bu₄NI (1 mmol), MeOH (10 ml) and O_2 (ballon) in an undivided cell equipped with two platinum-plate electrodes. The reaction was conducted with a constant current density of 8.9 mA/cm² at room temperature (Table 1, entry 4).

^{*a*}Reaction conditions: **1a** (0.5 mmol), electrolyte (1 mmol), O₂ ballon, solvent (10 mL); the electrolysis was conducted at a constant current (8.9 mA/cm²) in an undivided cell, room temperature. ^{*b*}The isolated yields after column chromatograpy. ^{*c*}Under air. ^{*d*}Stirring for 24 h at room temperature. n. d = not detected.

It was worth noting that under the standard reaction conditions without pass electricity, no desired

product was detected by TLC and the ¹H-NMR after stirring for 24 h (Table 1, entry 17). This

result suggested that the reaction driving force should be the employment of electric energy.

Table 2 Electrochemical Synthesis of Various Isatins^a

Reaction conditions: Table 1, entry 4. ^{*a*}The isolated yields after column chromatograpy. n. d = not detected. ^{*b*}The values in the parentheses were the current efficiency.

With the optimized conditions in hand, the scope of this reaction was investigated and the results were showed in Table 2. To our delight, compound 1a-1r with various substitutions on both aryl ring and the nitrogen atom can be employed as the reaction substrates to perform this transformation smoothly with the consumption of 9.0–23.9 F charge, affording the desired products 2a-2r in moderate to good yields, as shown in Table 2. On the other hand, various *N*-alkyl substituted isatins without substitution on the aromatic ring were synthesized in 59–84% yields (2a-2i). Afterwards, the 2'-aminoacetophenones with different *N*-phenyl substituents on the nitrogen atom could also be examined in this reaction. The corresponding products can be

obtained in spite of relatively lower yields (2j-2l), perhaps due to the low nucleophilicity of nitrogen atom. Moreover, it was found that the bromo/iodine-substituted 2'-aminoacetophenones derivatives were compatible with the standard reaction conditions to give isatins with moderate yields (2m-2p). To our satisfactory, when R₁ was the phenyl or the phenylacetylene substituent, the reaction can be still carried out well. The corresponding products can be obtained in the yields of 64% and 61% (2q and 2r), respectively. However, the 2'-aminoacetophenone bearing either electron withdrawing group or no substituent on the nitrogen of the amino group failed to afford the desired products (2s and 2t). It should be mentioned that the reaction between methyl ketones and iodine in the alcohol solvents could provide corresponding carboxylic esters with a loss of one carbon atom.²⁰ This was also observed in our reactions, which resulted in the moderate yields of the desired products. In addition, the reactions current efficiency was listed in the parentheses of the Table 2, which represented a mild and green method for the synthesis of isatins, although the current efficiency was relatively low.

To gain insight into the reaction mechanism, some control experiments were carried out (scheme 1). First, substrate 1a' was subjected to standard conditions to understand the role of amine group in the reaction mechanism. No desired product 2a was observed, but 2a' was isolated, which was identical to our previous reports.¹⁵ This result not only suggested the secondary amine was necessary for this transformation, but also implied that 2-(2-(dibenzylamino)phenyl)-2-oxoacetaldehyde may be the intermediate in this reaction (scheme 1a). Subsequently, when 1.0 equiv. of molecular iodine was employed as an oxidant in the presence of sodium methoxide (3.0 equiv.) without electrolysis, a trace amount of the desired product was detected and the substrate 1a was recovered (scheme 1b). When the reaction was

The Journal of Organic Chemistry

electrolyzed in the presence of 1.0 equiv. of molecular iodine and 2.0 equiv. of n-Bu₄NClO₄, trace amount of product **2a** and 1-(2-(benzylamino)-5-iodophenyl)ethanone (**1o**) were found (scheme 1c). The substrate **1a** could also be oxidized by the over-stoichiometric amounts of charge under the condition (1.1 V vs Ag/AgCl) and a trace amount of benzaldehyde was also detected (scheme 1c). These results indicated that molecular iodine (I₂) or hypoiodite was not active species in the initial step (from species **1** to **3** in scheme 2). The reaction should be initiated by an iodine radical generated on the anode surface. Moreover, when the reaction was electrolyzed under argon atmosphere instead of oxygen atmosphere, no desired product was observed. In contrast, methyl 2-(benzylamino)benzoate (**3a**) and 1-(2-(benzylamino)phenyl)-2,2-dimethoxyethanone (**4a**) were obtained with the yields of 46% and 29%, respectively under this condition (scheme 1d). These results further indicated that the oxygen atmosphere promoted this transformation (from species **3** to **4** in scheme 2) and inhabited the radical coupling between species **3** and iodine radial at the same time.

Scheme 1. Control Experiments for the Reaction

To further understand this reaction, electron paramagnetic resonance (EPR) experiments were performed to detect the possible free radicals involved in the reaction process. As shown in Figure 1, a complicated spectra **a** was obtained in the presence of the radical trapper

5,5-dimethyl-1-proline-N-oxide (DMPO). Three signal were identified by the characteristic β -proton.²¹ nitrogen and One hyperfine constants for was assigned be to (2-NHBn)PhCOCH₂-DMPO with the $A_{14N} = 15.2$ G and $A_{1H} = 25$ G. The hyperfine constant of β -proton was a little higher than that of saturated carbon center, perhaps due to the effect of nitrogen group. Another signal can be ascribed to DMPO-OH and the hyperfine constants for nitrogen and proton were $A_{14N} = A_{1H} = 14.8$ G. The last signal was found to be the oxidized DMPO with an A_{14N} = 14.6 G for the nitrogen atom, which was possibly oxidized by oxidizing substances generated under our reaction conditions. Spectra **b**, **c**, and **d** were their corresponding simulations ((2-NHBn)PhCOCH₂-DMPO, DMPO-OH and DMPOX), respectively. When we overlapped the spectra **b**, **c**, and **d** with an intensity ration of 3:2:10, the complicated spectra **e** was obtained, which was consistent with the experimental result \mathbf{a} . On the other hand, only weak background signal was observed in the absence of 1-(2-(benzylamino)phenyl)ethanone (1a). Therefore, these results further provided an evidence for a radical process in the reaction.

Figure 1. EPR spectra (X band, 9.7 GHz, room temperature) for reaction mixtures in the presence of the radical trapper DMPO and their simulations (b-e). (a) Spectra **a** was the experimental spectrum. (b) The simulation of (2-NHBn)PhCOCH₂-DMPO. (c) The simulation of DMPO-OH. (d) The simulation of DMPOX. (e) The overlapping of spectra **b**, **c**, and **d** with an intensity ration of 3:2:10 led to the complicated **e**, which was consistent with the experimental result **a**.

Base on the above mentioned results and the previous reports, a plausible mechanism was

proposed for this electrocatalytic C-H/N-H cross coupling reaction (scheme 2). First, an iodine

free radical generates on the platinum anode surface via an electrochemical oxidation, subsequently reacts with substrate **1** to produce intermediate **3**, accompanying with the loss of molecular hydrogen iodide. Perhaps due to the low concentration of radical intermediate **3** and iodine radical, this radical intermediate **3** is more easily trapped by oxygen molecule to form intermediate 4^{22} than the radical/radical coupling. However, the intermediate **4** is unstable and easily losses hydroxy radical 5^{23} to generate corresponding intermediate **6** under our reaction conditions. The leaving hydroxy radical **5** can be easily reduced in the cathode due to its high redox potential.²⁴ Afterwards, the intramolecular nucleophilic addition of intermediate **7**. Finally, the intermediate **7** is further oxidized to afford the desired product **2**. This oxidation can occur on the anode surface or can be conducted by molecular I₂ and CH₃OI generated in the reaction. On the cathode surface, MeOH is reduced to generate the methoxide anion and hydrogen gas, which can further react with hydrogen iodide to regenerate iodide anion to complete the catalytic cycle.

Scheme 2. Proposed Reaction Mechanism

In conclusion, we developed a mild electrochemically catalyzed approach to synthesize various isatins in moderate to good yields. The reaction was initiated by the iodine radical via an anodic oxidation, and subsequently induced C–O and C–N bond formation. This green process features the employment of electric energy as driving force, high atom economy and no additional

conducting salts. What is more, the reaction intermediates were detected by EPR and a probably radical reaction mechanism was proposed.

Experimental Section

General Information: All products were characterized by ¹H NMR and ¹³C{¹H}NMR, using TMS as an internal reference (¹H NMR: 400MHz, ¹³C{¹H}NMR: 100MHz). HRMS (ESI) data were recorded on a Q-TOF Premier. Commercial reagent and compound were used without purification unless otherwise indicated. Substrates **1a**–**1i** and **1s** were prepared according to the literature procedures.^{10b} Substrates **1j–1k**²⁵ and **1m–1r**^{26,10b} as well as **1a**'²⁷were synthesized according to the literature procedures.

Representative procedures for the synthesis of Isatins: An undivided cell was equipped with a magnet stirrer, platinum-plate (1.5 x 1.5 cm²) electrode as the working electrode and counter electrode. In the electrolytic cell, a mixture of 2'-aminoacetophenones (0.5 mmol), *n*-Bu₄NI (1 mmol, 369.4 mg), O_2 (balloon) and MeOH (10 ml) was allowed to stir and electrolyze at a constant current conditions (8.9 mA/cm²) under room temperature until the reaction finished (TLC analysis). Then the solvent was removed with a rotary evaporator and the residue was purified by column chromatography on silica gel to afford the desired product. The product was dried under high vacuum for at least 0.5 h before it was weighed and characterized by NMR spectroscopy.

EPR measurements and simulations for the capture of radicals: An undivided cell was equipped with a magnet stirrer, two platinum electrodes $(1.5 \times 1.5 \text{ cm}^2)$ both as the working electrode and the counter electrode respectively. A mixture of 1-(2-(benzylamino)phenyl)ethanone (1a) (0.5 mmol, 112.5mg), *n*-Bu₄NI (1 mmol, 369.4 mg), O₂ (balloon) and MeOH (10 ml) was stirred and electrolyzed at a constant current conditions (8.9 mA/cm²) under room temperature for

one hour. A 0.05 ml reaction solution was taken out into a small tube and mixed well with 0.03 ml of DMPO aqueous solution. Then the mixture was quick-freezed with liquid nitrogen and measured by EPR at room temperature. EPR simulation was performed with EasySpin software package in Mathlab.²⁸ The simulation parameters were microwave frequency 9.072 GHz, line width 1.1 G, g-2.00515 (without calibration). The hyperfine constants were shown in main text.

1-Benzylindoline-2,3-dione (2a)^{10c}

The title compound was prepared according to the general working procedure (5 h, 14.9 F) and purified by column chromatography (petroleum ether / ethyl acetate = 10:1) to give the product as a red solid: 84% yield, (100.0 mg); ¹H NMR (CDCl₃, 400 MHz, ppm): δ = 7.61 (d, J = 7.1 Hz, 1H), 7.48 (t, J = 7.4 Hz, 1H), 7.34–7.27 (m, 5H), 7.09 (t, J = 7.2 Hz, 1H), 6.78 (d, J = 7.5 Hz, 1H), 4.93 (s, 2H); ¹³C{¹H}NMR (CDCl₃, 100 MHz, ppm): δ = 183.3, 158.3, 150.7, 138.4, 134.5, 129.1, 128.2, 127.4, 125.4, 123.9, 117.7, 111.0, 44.1.

1-(4-Methoxybenzyl)indoline-2,3-dione (2b)^{10b}

The title compound was prepared according to the general working procedure (7 h, 20.9 F) and purified by column chromatography (petroleum ether / ethyl acetate = 10:1) to give the product as a red solid: 67% yield, (89.8 mg); ¹H NMR (CDCl₃, 400 MHz, ppm): δ = 7.61–7.59 (m, 1H), 7.48 (td, J = 7.8 Hz, J = 1.4 Hz,1H), 7.29–7.26 (m, 2H), 7.08 (td, J = 7.6 Hz, J = 0.76 Hz,1H), 6.89–6.85 (m, 2H), 6.80 (d, J = 8.0 Hz, 1H), 4.87 (s, 2H), 3.79 (s, 3H),; ¹³C{¹H}NMR (CDCl₃, 100 MHz, ppm): δ = 183.4, 159.5, 158.2, 150.8, 138.3, 128.9, 126.5, 125.4, 123.8, 117.7, 114.4, 111.0, 55.3, 43.6.

$1-(4-Methylbenzyl)indoline-2,3-dione (2c)^{30}$

The title compound was prepared according to the general working procedure (8 h, 23.9 F) and purified by column chromatography (petroleum ether / ethyl acetate = 10:1) to give the product as a red solid: 70% yield, (90.1 mg); ¹H NMR (CDCl₃, 400 MHz, ppm): δ = 7.60 (d, J = 7.5 Hz, 1H), 7.48 (t, J = 7.6 Hz, 1H), 7.23 (d, J = 7.8 Hz, 2H), 7.15 (d, J = 7.8 Hz, 2H), 7.08 (t, J = 7.5 Hz, 1H), 6.79 (d, J = 8.0 Hz, 1H); 4.89 (s, 2H), 2.33 (s, 3H),; ¹³C{¹H}NMR (CDCl₃, 100 MHz, ppm): δ = 183.4, 158.3, 150.8, 138.3, 138.0, 131.4,129.7, 127.5, 125.4, 123.8, 117.7, 110.0, 43.8, 21.1.

1-(3-(Trifluoromethyl)benzyl)indoline-2,3-dione (2d)

The title compound was prepared according to the general working procedure (5 h, 14.9 F) and purified by column chromatography (petroleum ether / ethyl acetate = 10:1) to give the product as a red solid: 72% yield, (110.2 mg), mp = 168–170 °C; ¹H NMR (CDCl₃, 400 MHz, ppm): δ = 7.65 (d, J = 7.4 Hz, 1H), 7.59 (d, J = 8.7 Hz, 2H), 7.55–7.47 (m, 3H), 7.14 (t, J = 7.5 Hz, 1H), 6.76 (d, J = 8.0 Hz, 1H); 4.99 (s, 2H), ¹³C{¹H}NMR (CDCl₃, 100 MHz, ppm): δ = 182.8, 158.3, 150.3, 138.5, 135.7, 131.5 (q, J = 32.2 Hz), 130.7, 129.7, 125.7, 125.2 (q, J = 3.7 Hz), 124.2, 124.18 (q, J = 3.8 Hz), 123.8 (q, J = 270.7 Hz), 117.7, 110.7, 43.6; HRMS calcd. [C₁₆H₁₀F₃NO₂ + Na]⁺: 328.0561, found: 328.0563.

1-(4-Bromobenzyl)indoline-2,3-dione (2e)²⁹

The title compound was prepared according to the general working procedure (6 h, 17.9 F) and purified by column chromatography (petroleum ether / ethyl acetate = 10:1) to give the product as a red solid: 70% yield, (110.1 mg); ¹H NMR (CDCl₃, 400 MHz, ppm): δ = 7.63 (d, J = 7.4 Hz, 1H), 7.52–7.47 (m, 3H), 7.22 (d, J = 8.1 Hz, 2H), 7.12 (t, J = 7.6 Hz, 1H), 6.74 (d, J = 7.9 Hz,

1H); 4.89 (s, 2H), ¹³C{¹H}NMR (CDCl₃, 100 MHz, ppm): δ = 183.0, 158.2, 150.4, 138.4, 133.6, 132.2, 129.1, 125.6, 124.1, 122.2, 117.7, 110.8, 43.5.

1-(4-Chlorobenzyl)indoline-2,3-dione (2f)^{10b}

The title compound was prepared according to the general working procedure (6 h, 17.9 F) and purified by column chromatography (petroleum ether / ethyl acetate = 10:1) to give the product as a red solid: 63% yield, (85.8 mg); ¹H NMR (CDCl₃, 400 MHz, ppm): δ = 7.63 (d, J = 7.6 Hz, 1H), 7.50 (t, J = 7.9 Hz, 1H), 7.34–7.29 (m, 4H), 7.12 (t, J = 7.5 Hz, 1H), 6.75 (d, J = 7.9 Hz, 1H); 4.90 (s, 2H), ¹³C{¹H}NMR (CDCl₃, 100 MHz, ppm): δ = 183.0, 158.2, 150.4, 138.4, 134.1, 133.0, 129.3, 128.8, 125.6, 124.1, 117.7, 110.8, 43.4.

1-Methylindole-2,3-dione (**2g**)^{10c}

The title compound was prepared according to the general working procedure (7 h, 20.9 F) and purified by column chromatography (petroleum ether / ethyl acetate = 6:1) to give the product as a red solid: 75% yield, (60.2 mg); ¹H NMR (CDCl₃, 400 MHz, ppm): δ = 7.64–7.60 (m, 2H), 7.14 (t, J = 7.6 Hz, 1H), 6.91 (d, J = 7.9 Hz, 1H), 3.26 (s, 3H), ¹³C{¹H}NMR (CDCl₃, 100 MHz, ppm): δ = 183.4, 158.3, 151.5, 138.4, 125.4, 123.9, 117.4, 109.9, 26.3.

1-Ethylindoline-2,3-dione (2h)^{10c}

The title compound was prepared according to the general working procedure (5 h, 14.9 F) and purified by column chromatography (petroleum ether / ethyl acetate = 6:1) to give the product as a red solid: 74% yield, (64.7 mg); ¹H NMR (CDCl₃, 400 MHz, ppm): δ = 7.62–7.58 (m, 2H), 7.12 (t, J = 7.5 Hz, 1H), 6.92 (d, J = 8.0 Hz, 1H), 3.82–3.77 (m, 2H), 1.32 (td, J = 7.2 Hz, J = 1.5 Hz, 3H),

¹³C{¹H}NMR (CDCl₃, 100 MHz, ppm): δ = 183.7, 157.9, 150.7, 138.4, 125.5, 123.6, 117.6, 110.0, 35.0, 12.5.

1-Allylindoline-2,3-dione (2i)^{10c}

The title compound was prepared according to the general working procedure (8 h, 23.9 F) and purified by column chromatography (petroleum ether / ethyl acetate = 10:1) to give the product as a red solid: 59% yield, (55.2 mg); ¹H NMR (CDCl₃, 400 MHz, ppm): δ = 7.63–7.56 (m, 2H), 7.13 (t, J = 7.5 Hz, 1H), 6.90 (d, J = 7.9 Hz, 1H), 5.81–5.90 (m, 1H), 5.39–5.25 (m, 2H), 4.38 (d, J = 5.2 Hz, 1H), ¹³C{¹H}NMR (CDCl₃, 100 MHz, ppm): δ = 183.3, 157.9, 150.8, 138.3, 130.3, 125.4, 123.8, 118.7, 117.5, 110.9, 42.5.

1-Phenylindoline-2,3-dione $(2j)^{10c}$

The title compound was prepared according to the general working procedure (8 h, 23.9 F) and purified by column chromatography (petroleum ether / ethyl acetate = 10:1) to give the product as a red solid: 39% yield, (43.8 mg); ¹H NMR (CDCl₃, 400 MHz, ppm): δ = 7.64–7.62 (m, 1H), 7.51–7.45 (m, 3H), 7.41–7.34 (m, 3H), 7.13–7.09 (m, 1H), 6.83 (d, J = 8.0 Hz, 1H), ¹³C{¹H}NMR (CDCl₃, 100 MHz, ppm): δ = 182.9, 157.3, 151.7, 138.4, 132.9, 130.0, 128.9, 126.0, 125.7, 124.3, 117.5, 111.3.

1-(p-tolyl)indoline-2,3-dione $(2k)^{10c}$

The title compound was prepared according to the general working procedure (5 h, 14.9 F) and purified by column chromatography (petroleum ether / ethyl acetate = 10:1) to give the product as a red solid: 40% yield, (47.4 mg); ¹H NMR (CDCl₃, 400 MHz, ppm): δ = 7.61 (d, J = 7.4 Hz, 1H),

7.46 (t, J = 7.9 Hz, 1H), 7.28 (d, J = 8.1 Hz, 2H), 7.23–7.19 (m, 2H), 7.09 (t, J = 7.5 Hz, 1H), 6.80 (d, J = 8.0 Hz, 1H), 2.36 (s, 3H), ¹³C{¹H}NMR (CDCl₃, 100 MHz, ppm): δ = 182.1, 156.4, 150.9, 138.0, 137.3, 129.5, 129.1, 124.8, 124.5, 123.2, 116.4, 110.2, 20.2.

1-Benzyl-5-bromoindoline-2,3-dione (2m)^{10c}

The title compound was prepared according to the general working procedure (4 h, 11.9 F) and purified by column chromatography (petroleum ether / ethyl acetate = 10:1) to give the product as a red solid: 74% yield, (116.1 mg); ¹H NMR (CDCl₃, 400 MHz, ppm): δ = 7.72 (s, 1H), 7.59 (dd, J = 8.4 Hz, J = 1.9 Hz,1H), 7.38–7.30 (m, 5H), 6.68 (d, J = 8.4 Hz, 1H), 4.93 (s, 2H); ¹³C{¹H}NMR (CDCl₃, 100 MHz, ppm): δ = 182.1, 157.5, 149.4, 140.5, 134.0, 129.2, 128.4, 128.2, 127.4, 118.8, 116.8, 112.7, 44.2.

5-Bromo-1-methylindoline-2,3-dione $(2n)^{10b}$

The title compound was prepared according to the general working procedure (3 h, 9.0 F) and purified by column chromatography (petroleum ether / ethyl acetate = 10:1) to give the product as a red solid: 42% yield, (50.2 mg); ¹H NMR (CDCl₃, 400 MHz, ppm): δ = 7.67–7.63 (m, 2H), 6.75 (d, J = 8.3 Hz, 1H), 3.18 (s, 3H), ¹³C{¹H}NMR (CDCl₃, 100 MHz, ppm): δ = 181.1, 156.5, 149.1, 139.6, 127.1, 117.6, 115.6, 110.6, 25.3.

1-Benzyl-5-iodoindoline-2,3-dione (20)^{10c}

The title compound was prepared according to the general working procedure (3 h, 9.0 F) and purified by column chromatography (petroleum ether / ethyl acetate = 6:1) to give the product as a red solid: 77% yield, (139.9 mg); ¹H NMR (CDCl₃, 400 MHz, ppm): δ = 7.83 (s, 1H), 7.77 (d, J =

8.3 Hz,1H), 7.38–7.30 (m, 5H), 6.57 (d, J = 8.3 Hz, 1H), 4.92 (s, 2H); ¹³C{¹H}NMR (CDCl₃, 100 MHz, ppm): δ = 181.9, 157.2, 150.0, 146.3, 134.0, 133.9, 129.2, 128.4, 127.4, 119.2, 113.2, 86.3, 44.1.

5-Iodo-1-methylindoline-2,3-dione (2p)^{10b}

The title compound was prepared according to the general working procedure (3 h, 9.0 F) and purified by column chromatography (petroleum ether / ethyl acetate = 6:1) to give the product as a red solid: 43% yield, (62.3 mg); ¹H NMR (CDCl₃, 400 MHz, ppm): δ = 7.88–7.92 (m, 2H), 6.72 (d, J = 8.2 Hz, 1H), 3.25 (s, 3H), ¹³C{¹H}NMR (CDCl₃, 100 MHz, ppm): δ = 182.0, 157.2, 150.7, 146.4, 133.7, 119.0, 112.1, 86.1, 26.3.

1-Benzyl-5-phenylindoline-2,3-dione $(2q)^{10c}$

The title compound was prepared according to the general working procedure (5 h, 14.9 F) and purified by column chromatography (petroleum ether / ethyl acetate = 10:1) to give the product as a red solid: 64% yield, (100.0 mg); ¹H NMR (CDCl₃, 400 MHz, ppm): δ = 7.85 (d, J = 1.7 Hz, 1H), 7.70 (dd, J = 8.2 Hz, J = 2.0 Hz,1H), 7.50–7.42 (m, 5H), 7.38–7.37 (m, 5H), 6.85 (d, J = 8.2 Hz, 1H), 4.97 (s, 2H); ¹³C{¹H}NMR (CDCl₃, 100 MHz, ppm): δ = 183.4, 158.4, 149.7, 138.9, 137.5, 136.8, 134.5, 129.1, 128.2, 127.9, 127.5, 127.1, 126.6, 124.0, 118.1, 111.4, 44.2.

1-Benzyl-5-(phenylethynyl)indoline-2,3-dione (2r)

The title compound was prepared according to the general working procedure (5 h, 14.9 F) and purified by column chromatography (petroleum ether / ethyl acetate = 10:1) to give the product as a red solid: 61% yield, (103.6 mg), mp = 180–182 °C; ¹H NMR (CDCl₃, 400 MHz, ppm): δ = 7.69

(d, J = 1.6 Hz, 1H), 7.55 (dd, J = 8.2 Hz, J = 1.7 Hz,1H), 7.43–7.41 (m, 2H), 7.30–7.25 (m, 8H), 6.70 (d, J = 8.2 Hz, 1H), 4.88 (s, 2H); $^{13}C{^{1}H}NMR$ (CDCl₃, 100 MHz, ppm): δ = 182.6, 158.1, 149.8, 141.1, 134.2, 131.6, 129.2, 128.7, 128.5, 128.3, 128.3, 127.4, 122.5, 119.4, 117.7, 111.1, 90.5, 87.2, 44.2; HRMS calcd. [$C_{23}H_{15}NO_2 + H$]⁺: 338.1181, found: 338.1176.

Methyl-2-(2-(dibenzylamino)phenyl)-2-oxoacetate(2a')

The title compound was prepared according to the general working procedure (2.5 h, 7.5 F) and purified by column chromatography (petroleum ether / ethyl acetate = 20:1) to give the product as a yellow oil: 42% yield, (75.1 mg); ${}^{13}C{}^{1}H{}NMR$ (CDCl₃, 400 MHz, ppm): δ = 7.65 (d, J = 7.7 Hz, 1H), 7.39 (t, J = 7.7 Hz, 1H), 7.21–7.17 (m, 6H), 7.09 (t, J = 7.5 Hz, 1H), 6.98 (d, J = 6.2 Hz, 4H), 6.88 (d, J = 8.1 Hz, 1H), 4.03 (s, 4H), 3.79 (s, 3H); ${}^{13}C{}^{1}H{}NMR$ (CDCl₃, 100 MHz, ppm): δ = 188.6, 165.0, 152.9, 136.1, 134.0, 131.5, 129.4, 129.2, 128.3, 127.6, 123.0, 122.5, 57.6, 52.7; HRMS calcd. [C₂₃H₂₁NO₃ + H]⁺: 360.1600, found: 360.1597.

Methyl-2-(benzylamino)benzoate(3a)

The title compound was prepared according to the general working procedure (5 h, 14.9 F) and purified by column chromatography (petroleum ether / ethyl acetate = 30:1) to give the product as a yellow oil: 46% yield, (55.1 mg). ¹H NMR (CD₃COCD₃, 400 MHz, ppm): δ = 8.23 (s, 1H), 7.88 (dd, J = 8.0 Hz, J = 1.6 Hz, 1H), 7.41–7.32 (m, 5H), 7.30–7.25 (m, 1H), 6.73 (d, J = 8.4 Hz, 1H), 6.61–6.57 (m, 1H), 4.51 (d, J = 5.7 Hz, 2H), 3.83 (s, 3H); ¹³C {¹H}NMR (CDCl₃, 100 MHz, ppm): δ = 168.1, 149.9, 137.8, 133.6, 130.6, 127.6, 126.1, 126.0, 113.8, 110.6, 109.1, 50.5, 45.9; HRMS calcd. [C₁₅H₁₅NO₂ + H]⁺: 242.1181, found: 242.1182.

1-(2-(Benzylamino)phenyl)-2,2-dimethoxyethanone(**4a**)

The title compound was prepared according to the general working procedure (5 h, 14.9 F) and purified by column chromatography (petroleum ether / ethyl acetate = 20:1) to give the product as a yellow oil: 29% yield, (41.1 mg). ¹H NMR (CD₃COCD₃, 400 MHz, ppm): δ = 9.22 (s, 1H), 8.13 (dd, J = 8.2 Hz, J = 1.3 Hz, 1H), 7.40–7.33 (m, 5H), 7.31–7.25 (m, 1H), 6.77 (d, J = 8.6 Hz, 1H), 6.61–6.57 (m, 1H), 5.16 (s, 1H), 4.53 (d, J = 5.7 Hz, 2H), 3.46 (s, 6H); ¹³C {¹H} NMR (CDCl₃, 100 MHz, ppm): δ = 194.9, 152.0, 138.3, 135.7, 132.6, 128,7, 127.3, 127.1, 114.6, 114.5, 112.2, 102.8, 54.3, 46.8; HRMS calcd. [C₁₇H₁₉NO₃ + Na]⁺: 308.1263, found: 308.1256.

- 19 The solubility of electrolytes, such as Me₄NI, Et₄NI, KI and *n*-Bu₄NI in MeOH, was different (from low to high), which were consistent with our experimental results (in table 1 entries 1–4). The solubility of Me₄NI was less than 0.05 M in MeOH. For instance, the solubility of Et₄NI was between 0.3 M and 0.4 M and the solubility of KI was between 0.7 M and 0.8 M. As for that of *n*-Bu₄NI was more than 1 M. Under our reaction condition, the concentration of n-Bu₄NI was not saturated.
