**S** Supporting Information

**ABSTRACT:** A highly efficient one-pot method has been developed for the synthesis of *meta*-terphenyls via a regioselective [3 + 3] annulation-elimination sequence involving Morita–Baylis–Hillman (MBH) acetates of nitro-alkenes and alkylidenemalononitriles. The reaction takes place in a regioselective manner under mild conditions (Et<sub>3</sub>N, room

temperature) to afford a wide variety of *meta*-terphenyls bearing aryl, heteroaryl and styrenyl groups. This novel [3 + 3] annulation takes advantage of the 1,3-bielectrophilic character of MBH acetates and 1,3-binucleophilic character of alkylidenemalononitriles and proceeds in a cascade fashion comprising an  $S_N2'$  substitution, intramolecular 6-endo-trig Michael addition and double elimination. Representative synthetic transformations of the products, for instance, to *meta*-terphenyl derived isoindolinones have also been demonstrated.

# INTRODUCTION

Synthesis of polysubstituted benzene derivatives via various annulation strategies, viz [2+2+2], [3+3], [4+2] and [5+1], often performed under acid/base or transition metal catalyzed conditions, is well documented in the literature.<sup>1</sup> However, the scope of acid/base mediated annulations and conventional functionalization methods is curtailed by poor regioselectivity and requirement of harsh reaction conditions. Synthesis of terphenyls, a chain of three benzene rings, is of particular interest as these are part of many natural products present in the plant kingdom, e.g., mushrooms, and exhibit various biological activities such as anticoagulant, antithrombotic, immunosuppressant, lipoxygenase inhibitory, neuroprotective and cytotoxic activities.<sup>2</sup> While most of the terphenyl natural products are paraderivatives and few are meta, no o-terphenyl natural products are thus far reported in the literature.<sup>2</sup> The few *m*-terphenyls that were isolated from natural sources include trifucol 1 (from seaweed Fucus vesiculosus),<sup>3</sup> macranthol 2, dunnialol 3, simonsinol 4 (from Chinese flowering plant Illicium macranthum),<sup>4</sup> mulberrofuran R 5 (from mulberry tree Morus ihou Koidz.)<sup>5</sup> and dictyoterphenyl 6 (from the cellular slime mold Dictyosteliumdiscoideum).<sup>6</sup> Possible applications of *m*-terphenyl derivatives as ligands in catalysis<sup>7</sup> and as versatile synthetic materials<sup>8</sup> have been extensively explored in recent years (Figure 1).

Synthesis of *m*-terphenyls<sup>9</sup> has been achieved via metal catalyzed coupling,<sup>6,10</sup> multicomponent reactions, including cyclotrimerization,<sup>11</sup> [3 + 3] annulation<sup>12,13</sup> and Bronsted acid catalyzed cyclization.<sup>14</sup> As for [3 + 3] annulation, a four-step method involving base mediated annulation of chalcone with ethyl acetoacetate followed by hydrolysis and aromatization<sup>12</sup> and a one-pot base mediated synthesis involving chalcone and allyl *p*-tolyl sulfone<sup>13</sup> are known in the literature. While a single example is reported following the former multistep method, a

mixture of *m*-terphenyls, with and without sulfone, is reported based on the latter method.

In the above scenario, we embarked on the idea of employing a [3 + 3] annulation strategy for the synthesis of *m*-terphenyls using the 1,3-bielectrophilic MBH acetate 7 and the 1,3binucleophilic malononitrile derivative 8 as 3-carbon components. In recent years, we and others have extensively exploited the 1,3-bielectrophilic nature of 7 in the synthesis of a variety of heterocycles.<sup>15</sup> However, construction of carbocycles using 7 as the 3-carbon component received much less attention<sup>16</sup> and aromatic compounds have never been the targets of such approaches. Although malononitrile derivative 8 has been employed as a 4-carbon nucleophile–electrophile in [4 + 2]annulation with nitroalkenes,<sup>17</sup> and as a 3-carbon component in [3+2] annulations,<sup>18</sup> the role of 8 as a 3-carbon binucleophile in [3 + 3] annulation received much less attention<sup>19</sup> and has not been exploited, to our knowledge, in the synthesis of aromatics, particularly, terphenyls (Figure 2).

### RESULTS AND DISCUSSION

At the outset, MBH acetate 7a was treated with nitrile 8a in the presence of different bases and in different solvents at room temperature (Table 1). While the reaction remained incomplete with 1 and 2 equiv of Et<sub>3</sub>N in THF even after 48 h (entries 1–2), complete conversion was achieved upon increasing the amount of Et<sub>3</sub>N to 3 and 4 equiv giving terphenyl 9a in 60 and 65% yields, respectively (entries 3–4). Though there is only marginal difference in these yields (entries 3–4), further improvement in the yield to 73% and reaction time to 7 h was possible by changing the solvent to  $CH_2Cl_2$  by using 4 equiv of Et<sub>3</sub>N (entry 5). A hydrocarbon solvent such a toluene was not the best for our

reaction (entry 6). Although other amine bases such as DABCO and Huenig's base (entries 7–8) as well as inorganic bases such as  $K_2CO_3$  and  $Cs_2CO_3$  (entries 9–10) were screened, only DABCO provided the desired terphenyl **9a**, though in low yield (entry 7). Having found Et<sub>3</sub>N to be the best base (entry 5), the yield and the reaction time were further improved, though marginally, from 73%, 7 h to 75%, 5 h, by changing the solvent from CH<sub>2</sub>Cl<sub>2</sub> to (CH<sub>2</sub>)<sub>2</sub>Cl<sub>2</sub> (entries 5 and 11).

The above optimized conditions, viz  $Et_3N$  (4 equiv),  $(CH_2)_2Cl_2$ , room temperature, were then employed to investigate the scope of MBH acetates 7 using nitrile **8a** as the model binucleophile (Table 2). The reaction of nitrile **8a** with different MBH acetates **7a**-**k** proceeded well to provide cyanoesters **9a**-**k** in 65–78% yield (entries 1–11). No appreciable substituent effect was observed in these reactions as MBH acetates with electron rich aryl **7a**-**e** (entries 1–5), electron deficient aryl **7g** (entry 7), parent phenyl **7f** (entry 6), heteroaryl **7h**-**i** (entries 8–9) and styrenyl **7j** (entry 10) afforded the cyanoesters **9a**-**j** in good yields (70–78%) in 3–15 h. However, marginally lower yield was encountered with MBH acetate **7k** possessing unsubstituted styrenyl group (65%, entry 11) and only a complex mixture was isolated in the case of aliphatic MBH acetate **7m** (entry 12).

Subsequently, one of the MBH acetates 7h was adopted to study the scope of nitriles 8 under our optimized conditions (Table 3). Nitriles with electron rich aryl 8b-d (entries 1-3), electron poor aryl 8e-h (entries 4-7), heteroaryl 8i (entry 8)

and styrenyl 8j-k (entries 9–10) groups reacted well with MBH acetate 7h under our optimized conditions to furnish cyanoesters 11b-k in good to excellent yield (69–83%). Again, no appreciable substituent effect was observed in these reactions except that the yield was marginally lower in the case of nitrile with a heteroaryl group 8i (69%, entry 8) and an electron poor styrenyl group (73%, entry 10). The reaction time was consistently 12–15 h (entries 2–10) except for nitrile 8b (entry 1).

Having investigated the scope of MBH acetate 7 and nitrile 8 in the synthesis of 2-cyano-3,5-disubstituted benzoates 9 and 11, we subjected primary MBH acetates 12 to the  $Et_3N$  mediated reaction with nitrile 8 in anticipation that 2,4-diarylbenzonitrile 13 would be formed (Table 4). Thus, treatment of acetate 12a with various nitriles 8a,b and 8d delivered 2,4-diarylbenzonitriles 13a-c in 72-76% yield (entries 1-3). Interestingly, the reaction of 12a with 8c provided intermediate 14d in 71% yield which did not undergo aromatization via elimination of HCN under our experimental conditions (entry 4). However, in a separate experiment, DBU (1.5 equiv) was added to the reaction mixture after complete conversion of 12a and 8c to 14d and the resulting mixture was stirred for 1 h to achieve elimination of HCN from 14d to form terphenyl 13d in 62% yield (entry 4). Heteroaryl MBH acetates 12b,c also reacted well with various nitriles 8a, 8c,d and 8f leading to 2,4-diarylbenzonitriles 13e-h in good to excellent yield (70-83%, entries 5-8). Finally, MBH acetates bearing an electron poor aryl group and parent phenyl group 12d and 12e, respectively, were also subjected to [3 + 3] annulation with a representative nitrile 8d to afford terphenyls 13i and 13j in 73-77% yield (entries 9-10). Unlike in the case of secondary MBH acetates 7 where the reaction was complete in 15 h or less (Tables 2 and 3), the reaction times for primary MBH acetates 12 were long (1-4 d) which are attributable to the active role the electron withdrawing ester group played in the reaction of 7 (see Scheme 1, vide infra).

The structure of benzonitriles 9 and 11 were established by extensive spectral analysis. That the two protons in the central aromatic ring appearing, in general, as doublets at  $\delta$  8.20–8.40 and 7.70–7.90 are meta to each other was confirmed by their low coupling constants (I = 1.4 - 1.8 Hz). The regiochemistry was confirmed by <sup>1</sup>H-<sup>1</sup>H 2D-NOESY experiment with **9a** in that the proton *ortho* to the ester group appearing at  $\delta$  8.26 had a positive NOE with only the anisyl protons whereas the para-proton exhibited NOE with both anisyl protons and phenyl protons (see the Supporting Information). Further unambiguous structural assignment was made by single crystal X-ray analysis of a representative product 11f (see the Supporting Information). As for benzonitrile 13, out of the three protons of the central aromatic ring appearing, in general, in a narrow range of 7.60-7.80, one appeared as a doublet with a small J value (1.5-1.8 Hz), another as a doublet with a large J value (7.7-8.2 Hz) and the third as a dd with a large and a small J value. This pattern was consistent with the regiochemistry in 13 which was further unambiguously established by <sup>1</sup>H-<sup>1</sup>H 2D-COSY experiment with a representative compound 13g. Thus, while the proton *ortho* to cyano group appeared at  $\delta$  7.73 as a doublet with a J value of 8.1 Hz, of the two meta-protons, one appeared as a doublet at  $\delta$ 7.69 with a small J value (1.7 Hz) and the other as dd at  $\delta$  7.62 with large and small J values (8.1, 1.7 Hz). The observed unsymmetrical <sup>1</sup>H and <sup>13</sup>C NMR pattern of **9f**, **11i** and **13c** (Ar<sup>1</sup> =  $Ar^2$ ) also ruled out regioisomers of terphenyls 9, 11 or 13. Structural and regiochemical assignment of intermediate 14d was performed based on <sup>1</sup>H NMR and <sup>1</sup>H-<sup>1</sup>H 2D-COSY spectra. The CH<sub>2</sub> protons of 14d appeared as a doublet at  $\delta$  3.15 coupled only to one olefinic proton appearing at  $\delta$  6.21 with a J value of 4.3 Hz. Although the <sup>4</sup>J coupling of this olefinic proton with the other appearing at  $\delta$  6.74 is not measurable enough, the cross-peaks are clearly observed in the COSY spectrum (see the Supporting Information).

The proposed mechanism for the formation of benzonitrile 9, 11 or 13 is outlined in Scheme 1. Deprotonation of the methyl group of nitrile 8 and addition of the resulting stabilized anion to MBH acetate 7 or 12 in a Michael fashion followed by elimination of the acetate in an overall  $S_N2'$  reaction generates intermediate I. Deprotonation at the allylic position of intermediate I generates a stabilized carbanion whose intramolecular Michael addition in a 6-endo-trig fashion to the newly formed nitroalkene moiety in I provides the cyclized product II. Finally,  $Et_3N$  mediated elimination of  $HNO_2$  and HCN furnishes the aromatized product 9, 11 or 13. This overwhelming preference for the 6-endo-trig cyclization over 5-exo-trig

<sup>*a*</sup>Isolated yield after silica gel column chromatography. <sup>*b*</sup>The reaction was carried out under microwave irradiation at 80 °C. <sup>*c*</sup>The intermediate 14d (71% isolated yield) underwent elimination to form 13d only after addition of DBU (1.5 equiv) and stirring at room temperature for 1 h.

cyclization obviously arises from the possibility of aromatization of the initial cycloadduct II. In fact, this is for the first time, the  $S_N 2'$  products of secondary MBH acetates 7 deviated from their normal cyclization mode of 5-*exo-trig* to 6-*endo-trig*.<sup>15</sup> Additional support for this mechanism emanated from the isolation of an intermediate in one case (14d, entry 4, Table 4). The reluctance of intermediate 14d to undergo elimination to 13d in the presence of Et<sub>3</sub>N (p $K_a$  10.8) is attributable to the poor acidity of allylic proton in 14d due to the *o*-OMe group. Therefore, a stronger base such as DBU (p $K_a$  12.0) was needed for elimination of HCN from 14d (entry 4, Table 4). An alternate pathway followed by allylic anion derived from intermediate I in the presence of Bronsted bases (entries 9–10, Table 1) to form diene 10 is also shown in Scheme 1.

A representative terphenyl **9h** was subjected to LiOH mediated selective hydrolysis of the ester group under mild conditions to 2-cyano-3,5-diarylbenzoic acid **15** in excellent yield (86%, Scheme 2). Preferential reactivity of cyano group was demonstrated by indium mediated addition of allyl bromide to **9a** and **9h** under MW irradiation conditions. Interestingly, both **9a** and **9h** undergo a cascade double allylation–intramolecular lactamization under these conditions to generate synthetically useful isoindolinones **16a,b** in high yield (77–81%, Scheme 2).

Scheme 2. Selected Synthetic Transformations of Terphenyl

# CONCLUSIONS

Polysubstituted *m*-terphenyls have been synthesized in high yield (62–83%) through a one-pot [3 + 3] annulation of Morita–Baylis–Hillman acetates of nitroalkenes and alkylidenemalononitrile in the presence of Et<sub>3</sub>N at room temperature. The annulation takes place via a regioselective cascade  $S_N 2'$ -intramolecular Michael reaction, which was confirmed by isolation of the intermediate cycloadduct, in one case, before

#### The Journal of Organic Chemistry

aromatization and its subsequent transformation to the aromatized product. The scope of the reaction was demonstrated using nitroallylic acetates and alkylidenemalononitriles bearing aryl, heteroaryl and styrenyl groups at the  $\beta$ -position of the nitro/ cyano group. Representative transformations of *meta*-terphenyl cyanoesters to corresponding carboxylic acids and isoindolinones have also been carried out.

#### EXPERIMENTAL SECTION

**General Methods.** The melting points recorded are uncorrected. NMR spectra were recorded with TMS as the internal standard for <sup>1</sup>H, <sup>1</sup>H decoupled <sup>13</sup>C, <sup>13</sup>C-APT, <sup>1</sup>H–<sup>1</sup>H-2D-COSY and NOESY and C<sub>6</sub>H<sub>5</sub>CF<sub>3</sub> as the external standard for <sup>19</sup>F. The coupling constants (*J* values) are given in Hz. High resolution mass spectra were recorded under ESI Q-TOF conditions. X-ray data were collected on a diffractometer equipped with graphite monochromated Mo K*α* radiation. The structure was solved by direct methods shelxs97 and refined by full-matrix least-squares against F<sup>2</sup> using SHELXL97 software. The secondary MBH acetates 7 (E = CO<sub>2</sub>Et)<sup>20</sup> and the primary MBH acetates **11** (E = H)<sup>21</sup> were prepared from corresponding alcohols.<sup>22,23</sup> Malononitrile derivatives **8** were prepared from corresponding methyl ketone and malononitrile.<sup>24</sup>

General Procedure for the Synthesis of *m*-Terphenyls 9, 11, 13. To a stirred solution of MBH-acetate 7 or 12 (0.17 mmol) in DCE (3 mL) at rt, was added alkylidene malononitrile 8 (0.17 mmol) followed by triethylamine (0.1 mL, 69 mg, 0.68 mmol), and the completion of the reaction was monitored by TLC. The crude product was directly purified by silica gel column chromatography by eluting with 5–20% EtOAc–pet ether (gradient elution). In the case of entry 4, Table 4, the intermediate 14d was either isolated or treated in situ with DBU (38  $\mu$ L, 0.25 mmol) to afford 13d.

**2**",**4**-Dimethoxy-[1,1':3',1"-terphenyl]-4',**4**'(5'H)-dicarbonitrile (14d). Pale yellow solid: yield 71%, 41 mg; mp 117 °C; IR (KBr, cm<sup>-1</sup>) 2958 (m), 2923 (vs), 2851 (m), 2222 (w), 1726 (m), 1606 (m), 1513 (m), 1488 (w), 1462 (m), 1250 (s), 1180 (m), 1120 (w), 1025 (s), 834 (w), 756 (s); <sup>1</sup>H NMR (400 MHz, CDCl<sub>3</sub>)  $\delta$  7.43 (t, *J* = 7.7 Hz, 1H), 7.38 (d, *J* = 8.5 Hz, 2H), 7.31 (dd, *J* = 7.7, 1.5 Hz, 1H), 7.04–6.99 (m, 2H), 6.90 (d, *J* = 8.5 Hz, 2H), 6.74 (s, 1H), 6.21 (t, *J* = 4.3 Hz, 1H), 3.99 (s, 3H), 3.82 (s, 3H), 3.15 (d, *J* = 4.3 Hz, 2H); <sup>13</sup>C NMR (100 MHz, CDCl<sub>3</sub>)  $\delta$  160.0, 157.1, 137.6, 131.2, 130.6, 130.3, 128.9, 127.1, 125.7, 121.3, 116.4, 115.6, 114.3, 111.1, 55.5, 54.8, 35.6, 35.1; MS (ES<sup>+</sup>, Ar) *m/z* (rel intensity) 381 (MK<sup>+</sup>, 31), 365 (MNa<sup>+</sup>, 100); HRMS (ES<sup>+</sup>, Ar) calcd for C<sub>22</sub>H<sub>18</sub>N<sub>2</sub>O<sub>2</sub>Na (MNa<sup>+</sup>) 365.1260, found 365.1258. Confirmed by <sup>1</sup>H–<sup>1</sup>H 2D-COSY experiment.

(*E*)-2-(3-(4-Methoxyphenyl)-1-phenylallylidene)malono-nitrile (10).<sup>25</sup> To a stirred solution of MBH–acetate 7a (0.17 mmol) in DCM (3 mL) at rt, was added alkylidene malononitrile 8 (0.17 mmol) followed by K<sub>2</sub>CO<sub>3</sub> (94 mg, 0.68 mmol) or Cs<sub>2</sub>CO<sub>3</sub> (222 mg, 0.68 mmol) and the completion of the reaction was monitored by TLC. The crude product was directly purified by silica gel column chromatography by eluting with 3-10% EtOAc-pet ether (gradient elution). Yellow solid: yield 68%, 32 mg (K<sub>2</sub>CO<sub>3</sub>, entry 9, Table 1), 70%, 37 mg (Cs<sub>2</sub>CO<sub>3</sub>, entry 10, Table 1); mp 119 °C (lit 125 °C, <sup>25a</sup> 129 °C<sup>25b</sup>); IR (KBr, cm<sup>-1</sup>) 2925 (m), 2854 (w), 2221 (m), 1594 (s), 1569 (m), 1521 (s), 1255 (vs), 1175 (s), 1105 (w), 1027 (m), 834 (w), 762 (br m); <sup>1</sup>H NMR  $(400 \text{ MHz}, \text{CDCl}_3) \delta 7.60 - 7.44 \text{ (m, 6H)}, 7.37 \text{ (d, } I = 6.7 \text{ Hz}, 2\text{H}), 6.91$ (d, J = 8.6 Hz, 2H), 6.83 (d, J = 15.4 Hz, 1H), 3.85 (s, 3H); <sup>13</sup>C NMR (125 MHz, CDCl<sub>3</sub>) δ 171.7, 162.9, 149.3, 133.5, 131.2, 131.0, 129.1, 129.0, 127.3, 122.4, 114.9, 113.9, 113.3, 80.8, 55.7; MS (ES<sup>+</sup>, Ar) m/z (rel intensity) 328 ( $[MK+3]^+$ , 11), 327 ( $[MK+2]^+$ , 51), 310 ([MNa+1]<sup>+</sup>, 23), 309 (MNa<sup>+</sup>, 100), 304 (8); HRMS (ES<sup>+</sup>, Ar) calcd for  $C_{19}H_{14}N_2ONa~(MNa^+)$  309.0998, found 309.1000. IR and <sup>1</sup>H NMR data are broadly in agreement with literature.<sup>25</sup>

General Procedure for Selective Hydrolysis of Ester 9h. Lithium hydroxide (26 mg, 1.103 mmol, 7 equiv) was added to a stirred solution of cyanoester 9h (50 mg, 0.158 mmol) in THF/water (1:1, 1 mL) at room temperature. After overnight stirring, the reaction mixture was poured into 1 N HCl and extracted with diethyl ether ( $3 \times 10$  mL). The combined organic extracts were washed with brine (10 mL), dried (Na<sub>2</sub>SO<sub>4</sub>), and concentrated in vacuo to give the title compound 15.

**2-Cyano-5-(furan-2-yl)-[1,1'-biphenyl]-3-carboxylic acid (15).** Pale yellow solid: yield 86%, 39 mg; mp 223 °C; IR (KBr, cm<sup>-1</sup>) 3647 (br, w), 2926 (br, s), 2223 (w), 1705 (s), 1604 (m), 1468 (m), 1295 (m), 934 (br, s), 695 (vs); <sup>1</sup>H NMR (400 MHz, DMSO)  $\delta$  13.97 (br s, 1H), 8.30 (unresolved, 1H), 8.00 (unresolved, 1H), 7.89 (unresolved, 1H), 7.58–7.52 (m, 5H), 7.41 (unresolved, 1H), 6.68 (unresolved, 1H); <sup>13</sup>C NMR (100 MHz, DMSO)  $\delta$  165.5, 150.4, 147.8, 145.2, 137.7, 135.8, 133.5, 129.1, 128.9, 128.5, 127.4, 123.6, 116.6, 112.9, 110.6, 107.9; MS (ES<sup>+</sup>, Ar) *m/z* (rel intensity) 328 (MK<sup>+</sup>, 23), 312 (MNa<sup>+</sup>, 100), 301 (6); HRMS (ES<sup>+</sup>, Ar) calcd for C<sub>18</sub>H<sub>11</sub>NO<sub>3</sub>Na (MNa<sup>+</sup>) 312.0631, found 312.0634. General Procedure for Synthesis of 4-Phenylisoindolin-1-one Derivatives 16. A stirred mixture of cyanoester 9 (0.140 mmol), allyl bromide (68 mg, 48  $\mu$ L, 4.0 equiv, 0.56 mmol), and indium powder (32 mg, 2 equiv, 0.28 mmol) in THF (0.5 mL) was heated to 90 °C under microwave irradiation for 1–2 h. After completion of reaction, the crude product was directly purified by silica gel column chromatography by eluting with EtOAc–pet ether (gradient elution) to afford pure 16.

**3,3-Diallyl-6-(4-methoxyphenyl)-4-phenylisoindolin-1-one** (16a). Off white solid: yield 81%, 45 mg; mp 181 °C; IR (KBr, cm<sup>-1</sup>) 3206 (br, w), 3074 (vw), 2929 (vw), 2836 (vw), 1696 (vs), 1609 (w), 1519 (vw), 1468 (m), 1442 (w), 1360 (w), 1288 (w), 1250 (m), 1179 (w), 1030 (vw), 921 (w); <sup>1</sup>H NMR (500 MHz, CDCl<sub>3</sub>)  $\delta$  8.04 (d, *J* = 1.3 Hz, 1H), 7.60 (d, *J* = 8.7 Hz, 2H), 7.54 (d, *J* = 1.3 Hz, 1H), 7.46–7.45 (m, 3H), 7.36–3.35 (m, 2H), 6.97 (d, *J* = 8.7 Hz, 2H), 5.46 (ddt, *J* = 17.2, 10.1, 7.0 Hz, 2H), 5.03–4.99 (m, 4H), 3.84 (s, 3H), 2.48 (dd, *J* = 14.3, 7.0 Hz, 2H), 2.36 (dd, *J* = 14.3, 7.0 Hz, 2H); <sup>13</sup>C NMR (125 MHz, CDCl<sub>3</sub>)  $\delta$  170.2, 159.7, 143.6, 141.0, 139.8, 138.7, 134.0, 132.5, 132.1, 132.0, 129.2, 128.4, 128.17, 128.22, 120.8, 119.6, 114.5, 65.6, 55.5, 42.5; MS (ES<sup>+</sup>, Ar) *m/z* (rel intensity) 436 ([M + CH<sub>3</sub>CN]<sup>+</sup>, 30), 418 (MNa<sup>+</sup>, 100); HRMS (ES<sup>+</sup>, Ar) calcd for C<sub>27</sub>H<sub>25</sub>NO<sub>2</sub>Na (MNa<sup>+</sup>) 418.1777, found 418.1779.

**3,3-Diallyl-6-(furan-2-yl)-4-phenylisoindolin-1-one (16b).** White solid: yield 77%, 38 mg; mp 218 °C; IR (KBr, cm<sup>-1</sup>) 3183 (w), 3072 (w), 2899 (w), 1691 (vs), 1436 (vw), 1353 (w), 1254 (vw), 1017 (vw), 995 (w), 923 (w); <sup>1</sup>H NMR (500 MHz, CDCl<sub>3</sub>)  $\delta$  8.10 (d, *J* = 1.6 Hz, 1H), 7.67 (d, *J* = 1.6 Hz, 1H), 7.46–7.45 (m, 4H), 7.34–7.33 (m, 2H), 7.01–6.99 (br, 1H), 6.75 (dd, *J* = 3.3, 0.3 Hz, 1H), 6.48 (dd, *J* = 3.4, 1.8 Hz, 1H), 5.43 (ddt, *J* = 17.1, 10.1, 7.1 Hz, 2H), 5.01 (d, *J* = 17.1 Hz, 2H), 4.99 (d, *J* = 10.1 Hz, 2H), 2.44 (dd, *J* = 14.3, 7.1 Hz, 2H), 2.34 (dd, *J* = 14.3, 7.1 Hz, 2H); <sup>13</sup>C NMR (100 MHz, CDCl<sub>3</sub>)  $\delta$  169.9, 153.0, 144.0, 142.7, 139.5, 138.8, 134.1, 131.8, 131.2, 129.4, 129.1, 128.3 (× 2), 119.6, 118.2, 112.0, 106.4, 65.9, 42.4; MS (ES<sup>+</sup>, Ar) *m/z* (rel intensity) 394 (MK<sup>+</sup>, 81), 378 (MNa<sup>+</sup>, 100), 369 (6), 353 (8); HRMS (ES<sup>+</sup>, Ar) calcd for C<sub>24</sub>H<sub>21</sub>NO<sub>2</sub>Na (MNa<sup>+</sup>) 378.1464, found 378.1461.
