Abstract

Fe_3O_4 -supported copper (II) Schiff-Base complex has been synthesized through post-modification with 1,3-phenylenediamine followed by further post-modification with salicylaldehyde and coordination with Cu(II) ion. The resulted $\text{Fe}_3\text{O}_4@\text{SiO}_2$ -imine/phenoxy-Cu(II) magnetic nanoparticles (MNPs) were characterized by various techniques including SEM, TEM, XRD, XPS, EDX, VSM, FT-IR, and ICP. The catalytic activity as a magnetically recyclable heterogeneous catalyst for one-pot, three-component synthesis of 2-amino-4H-chromene derivatives was examined. The catalyst is efficient in the reaction and can be recovered by magnetic separation and recycled several times without significant loss in the catalytic activity.

KEY WORDS

2-amino-4H-chromene, Fe_3O_4 -immobilized-Cu (II) Schiff-Base complex, magnetic nanoparticles, nanocatalyst, three-component reaction

1 | INTRODUCTION

In the last few decades, scientists have greatly concerned about the environmental health issues originating from catalytic processes and have made considerable efforts for development of eco-friendly recyclable catalysts for organic transformations such as multi-component reactions (MCRs) in the synthetic and industrial fields.^[1–6] In recent years, immobilization of different homogeneous catalysts onto various nanoparticles has emerged as a promising strategy for improving the catalytic efficiency and stability.^[7] The last few decades have witnessed a considerable progress in the development of various magnetic nanoparticles (MNPs) as sustainable and efficient supports or catalysts in organic synthesis and industrial fields due to their interesting physical and chemical characteristics such as large surface to volume ratio, high atom efficiency, easy magnetic separation and high

potential of recyclability.^[8–13] As previously reported, the use of various magnetic metal oxides and hybrid metal oxide nanoparticles such as Fe_2O_3 , Fe_3O_4 , TiO_2 , Al_2O_3 , ZnO , and $\text{La}_{0.7}\text{Sr}_{0.3}\text{MnO}_3$ have attracted a massive attention both in industry and organic reactions as catalysts and/or supports.^[14,15] Magnetic Fe_3O_4 nanoparticles have emerged as a privileged support for immobilization of various ligands and functional groups such as phosphorous, nitrogen and organic moieties owing to the presence of high density hydroxyl groups on their surface, high surface area, high stability, facile magnetic separation, environmental benignity and high loading capacity.^[13,16–25] Among different nitrogen-based ligands, Schiff-Base ligands supported on magnetic nanoparticles immobilize in excellent state through the coordination to a variety of transition metals with improved catalytic activity and stability.^[26–31] This is because the ligands containing N-donors exhibit a high performance by a

stable hosting a range of metal cations and as a result, these materials become excellent candidates in catalysis design as well as analytical, industrial and medicinal applications.^[32–36] In comparison, the Cu-based catalysts have offered excellent alternatives to other noble-metal-based catalysts due to their interesting features including low price, facile separation and high catalytic performance.^[37–39] In addition, another environmentally important synthetic approach is the use of multi-component reactions (MCRs) that have attracted enormous interest as convergent and high atom-economy processes.^{2f, h, 41–46}

Among the heterocyclic compounds, chromenes and their derivatives are well-documented compounds of important biological and pharmacological importance which perform anticancer, spasmolytic, diuretic, anti-HIV, antimarial, and anti-anaphylactic activities.^[31,46–50] A large group of chromenes have been widely used as therapeutically useful agents such as acenocoumarol which functions as an anticoagulant and is used for the treatment of bronchial asthma.^[51] Also, a wide variety of chromenes are naturally occurring products contained in many secondary metabolites, as pigments, flavonoids, and anthocyanin.^[52,53] In addition, a variety of chromenes have found wide applications as pigments, cosmetics, and biodegradable agrochemicals.^[54] The methods reported in the literatures for the synthesis of chromenes utilize various catalytic systems such as ionic liquids,^[54] hexadecyltrimethyl ammonium bromide,^[55] diammonium hydrogen phosphate (DAHP),^[56] Mg/La mixed metal oxides,^[57] α -Fe₂O₃ nanoparticles,^[58] silica-grafted ionic liquid,^[59] and H₆P₂W₁₈O₆₂.18H₂O.^[60]

2 | EXPERIMENTAL

2.1 | General

Chemicals were purchased from Merck Chemical Company and used without further purification. Melting points were determined in open capillary tubes using a BUCHI 510 apparatus. Fourier transform infrared (FT-IR) spectra were recorded from KBr pellets on a Perkin Elmer GX FT-IR spectrometer. ¹H NMR and ¹³C NMR spectra were recorded for samples in CDCl₃ or DMSO-d₆ on 90, 250 and 400 MHz BRUKER AVANCE instruments at ambient temperature using tetramethylsilane (TMS) as internal standard. Scanning electron microscopy (SEM) images were obtained on EM3200 instrument operated at 30 kV accelerating voltage. Energy-dispersive X-ray (EDX) analysis was carried out using a FESEM-SIGM (German) instrument. Thermo-gravimetric analysis

(TGA) was recorded in air using TGA/DTA PYRIS DIAMOND instrument. Magnetic measurement of the catalyst was performed using a vibrating sample magnetometer (VSM) instrument MDKFT. Moreover, high resolution transmission electron microscopy (TEM) was conducted on the nanoparticles using a HRTEM Philips CM30, (300KV) instrument. Inductively coupled plasma optical emission spectroscopy (ICP-OES) was performed by Arcos EOP, 32 Linear CCD simultaneous ICP analyzer. X-ray photoelectron spectral (XPS) analysis was performed using a K-Alpha spectrometer. To gain an accurate understanding of the molecular structures of 2-amino-4H-chromene derivatives, geometry optimization and conformational analysis were performed in the gas phase with the Gaussian 09 suite of programs and the Beck's three-parameter hybrid method B3LYP with the 6-31G (d,p) basis set. Vibrational frequency analysis was also performed at the same level to ensure the structures are local minima. The natural bond orbital (NBO) method on the wave functions was obtained at the same level of theory by NBO 3.1 program.^[61–64] The characterization data for the catalyst and the titled products are available online in the supporting information section at the end of the article (Scheme 1).

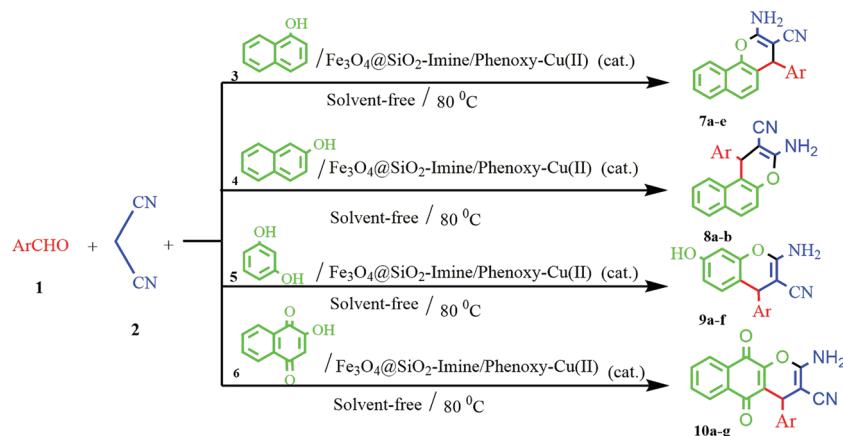

2.2 | Preparation of Fe₃O₄-supported copper (II) Schiff-base complex, Fe₃O₄@SiO₂-imine/phenoxy-Cu(II) (MNPs)

The Fe₃O₄@SiO₂-imine/phenoxy-Cu(II) core-shell magnetic nanoparticles were successfully prepared in six steps as depicted in Scheme 2 and explained below.

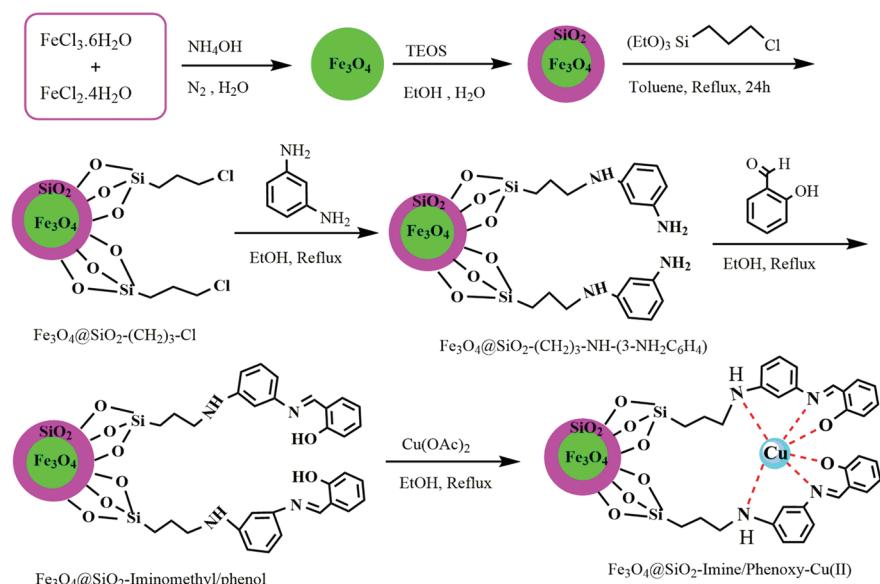

2.2.1 | Synthesis of SiO₂-modified core-shell Fe₃O₄ MNPs

Fe₃O₄ magnetic nanoparticles were synthesized by co-precipitation of Fe³⁺ and Fe²⁺ ions with [Fe³⁺]/[Fe²⁺] molar ratio of 2:1 as described in the literature.^[65] Shortly, FeCl₃.6H₂O (5.4 g, 0.02 mol) and FeCl₂.4H₂O (2.0 g, 0.01 mol) were dissolved in deionized water (80 ml) under nitrogen atmosphere with vigorous stirring. Then, 25% aqueous NH₄OH solution (10 ml) was added dropwise at the constant rate of 1 ml per min to the mixture at 80 °C in N₂ atmosphere that resulted in the formation of uniform black Fe₃O₄ magnetic nanoparticles. Then, these black particles were cooled to room temperature, washed twice with deionized water and 0.02 M aqueous NaCl solution consecutively, and decanted using an external magnet. In the following step, the as-prepared Fe₃O₄ nanoparticles (1 g) were dispersed

SCHEME 1 Three-component synthesis of various 2-amino-4*H*-chromene-3-carbonitrile derivatives catalyzed by $\text{Fe}_3\text{O}_4@\text{SiO}_2$ -imine/phenoxy-Cu(II) MNPs

SCHEME 2 Stepwise preparation of $\text{Fe}_3\text{O}_4@\text{SiO}_2$ -Imine/Phenoxy-Cu(II) MNPs

in a mixture of ethanol (100 ml) and deionized water (10 ml) containing 25% ammonia solution (2.5 ml). Then, tetraethyl orthosilicate (TEOS) (2 ml) was added dropwise and the stirring was continued for 2 hr at 60 °C. The resulted product was magnetically separated, washed repeatedly with deionized water and ethanol, and then dried in air for 4 hr.^[66]

2.2.2 | Chloro-functionalization of $\text{Fe}_3\text{O}_4-\text{SiO}_2$

The prepared core-shell $\text{Fe}_3\text{O}_4@\text{SiO}_2$ (1 g) was added to a solution of (3-chloropropyl)triethoxysilane (CPTES) (3 ml) in dry toluene (100 ml) followed by stirring at 90 °C for 12 hr in N_2 atmosphere. Finally, chloropropyl-bonded magnetic nanoparticles ($\text{Fe}_3\text{O}_4@\text{SiO}_2-(\text{CH}_2)_3-\text{Cl}$) at the end of the reaction were repeatedly washed with toluene, separated by using a magnet and dried under reduced pressure.

2.2.3 | Immobilization of 1,3-phenylenediamine on $\text{Fe}_3\text{O}_4@\text{SiO}_2-(\text{CH}_2)_3-\text{Cl}$ MNPs

To a solution of 1,3-phenylenediamine (1.3 g, 0.012 mol) and a few drops of triethylamine as a base in ethanol (70 ml), $\text{Fe}_3\text{O}_4@\text{SiO}_2-(\text{CH}_2)_3-\text{Cl}$ (1 g) was added to obtain a suspension in 15 min. The resulting mixture was refluxed in N_2 for 24 hr and the final precipitate as the product was separated with a magnet, washed three times with ethanol and dried at room temperature.

2.2.4 | Conversion of $\text{Fe}_3\text{O}_4@\text{SiO}_2-(\text{CH}_2)_3-\text{NH}-\text{(3-NH}_2\text{C}_6\text{H}_4$ into iminomethyl/phenol Schiff-base derivative ($\text{Fe}_3\text{O}_4@\text{SiO}_2$ -iminomethyl/phenol)

Above-prepared $\text{Fe}_3\text{O}_4@\text{SiO}_2-(\text{CH}_2)_3-\text{NH}-\text{(3-NH}_2\text{C}_6\text{H}_4$ nanoparticles (1 g) were dispersed in 50 ml of methanol

in 15 min and was heated to reflux point. Then, to this suspension was added dropwise a solution of salicylaldehyde (2.93 g, 24 mmol) in ethanol (30 ml) using a decanter funnel. The reaction mixture was refluxed for 24 hr and the precipitated $\text{Fe}_3\text{O}_4@\text{SiO}_2$ -Iminomethyl/phenol nanoparticles were separated using a magnet, washed repeatedly with ethanol, and dried in an oven.

2.2.5 | Preparation of the Fe_3O_4 -immobilized Schiff-base Cu(II) complex $\text{Fe}_3\text{O}_4@\text{SiO}_2$ -imine/phenoxy-Cu(II)

To a dispersion of previously prepared $\text{Fe}_3\text{O}_4@\text{SiO}_2$ -iminomethyl/phenol nanoparticles (1 g) in ethanol (50 ml) was added dropwise a 5% (*w/v*) solution of Cu(OAc)₂ in ethanol (5 ml) and the resulting mixture was refluxed for 48 hr. After the reaction completed, the expected $\text{Fe}_3\text{O}_4@\text{SiO}_2$ -iminomethyl/phenol nanoparticles were magnetically separated by using a magnet. Finally, the isolated nanoparticles were washed repeatedly with ethanol and water to remove the remaining unreacted materials, and dried at 80 °C for 6 hr.

2.3 | General procedure for synthesis of 2-amino-4*H*-chromene derivatives 7–10

To a mixture of aromatic aldehyde **1** (1.0 mmol), malononitrile **2** (0.067 g, 1 mmol) and phenolic reagent (α -naphthol **3**, β -naphthol **4**, resorcinol **5** or 2-hydroxy-naphthalene-1,4-dione **6**) (1.0 mmol), catalyst, $\text{Fe}_3\text{O}_4@\text{SiO}_2$ -imine/phenoxy-Cu(II) (0.02 g), was added. The mixture was stirred with a magnetic stirrer and heated at 80 °C under solvent-free conditions for an appropriate time until the mixture turned into solid (Table 1). After completion of the reaction, judged by TLC, the resulting reaction mixture was cooled to room temperature, diluted with hot ethanol (20 ml), and the catalyst was separated by an external magnet. The precipitated product was isolated by filtration and purified by recrystallization in hot ethanol.

Brown; m.p. 212–214 °C; yield 96%; FT-IR (KBr) ν : 3591, 3476, 3328, 3196, 2192, 1662, 1637, 1557, 1437, 1292, 1103, 845, 747 cm⁻¹; ¹H-NMR (90 MHz, DMSO-d₆) δ : 8.26–7.24 (m, 9H, Ar-H), 6.82 (s, 2H, NH₂), 5.95 (s, 1H, C-H) ppm.

2.4.3 | 3-Amino-4-(4-chloro-3-nitrophenyl)-4*H*-benzo[*h*]chromene-2-carbonitrile (7 c)

Light brown; m.p. 212–214 °C; yield 97%; FT-IR (KBr) ν : 3473, 3328, 3196, 3068, 2194, 1669, 1603, 1570, 1535, 1411, 1377, 1260, 1190, 806, 754 cm⁻¹; ¹H-NMR (400 MHz, DMSO-d₆) δ : 8.25 (d, *J* = 8.24 Hz, 1H, Ar-H), 8.03 (d, *J* = 1.7 Hz, 1H, Ar-H), 7.90 (d, *J* = 8.01 Hz, 1H, Ar-H), 7.72 (d, *J* = 8.01 Hz, 1H, Ar-H), 7.66–7.57 (m, 4H, Ar-H), 7.34 (s, 2H, NH₂), 7.13 (d, *J* = 8.52 Hz, 1H, Ar-H), 5.15 (s, 1H, C-H) ppm; ¹³C-NMR (100 MHz, DMSO-d₆) δ : 160.3, 147.6, 146.6, 142.9, 133.2, 132.9, 132.1, 127.7, 127.0, 126.8, 125.8, 124.5, 124.2, 123.5, 122.7, 120.8, 120.1, 116.2 ppm. ESI-MSM/Z = 376.9 [M]⁺.

2.4.4 | 3-Amino-4-(4-methoxyphenyl)-4*H*-benzo[*h*]chromene-2-carbonitrile (7 d)

Cream; m.p. 198–200 °C; yield 90%; FT-IR (KBr) ν : 3417, 3326, 3203, 2907, 2837, 2194, 1606, 1509, 1408, 1290, 1191, 1024, 809, 743 cm⁻¹; ¹H-NMR (90 MHz, DMSO-d₆) δ : 8.28–6.91 (m, 10H, Ar-H), 6.82 s, 2H, NH₂), 4.8 (s, 1H, C-H), 3.71 (s, 3H, OCH₃) ppm.

2.4.5 | 3-Amino-4-(4-hydroxyphenyl)-4H-benzo[*h*]chromene-2-carbonitrile (7 e)

Brown; m.p. 241–243 °C; yield 97%; FT-IR (KBr) ν : 3457, 3316, 3192, 2198, 1630, 1511, 1448, 1261, 1039, 854, 749 cm⁻¹; ¹H-NMR (90 MHz, DMSO-d₆) δ : 9.32 (s, 1H, OH), 8.26–6.37 (m, 10H, Ar-H), 6.64 (s, 2H, NH₂), 4.77 (s, 1H, C-H) ppm.

2.4.6 | 3-Amino-4-phenyl-1*H*-benzo[*f*]chromene-2-carbonitrile (8 a)

Light brown; m.p. 270–272 °C; yield 93%; FT-IR (KBr) ν : 3434, 3339, 3193, 3022, 2885, 2183, 1639, 1517, 1284, 815, 610 cm⁻¹; ¹H-NMR (90 MHz, DMSO-d₆) δ : 8.29–8.17 (d, 1H, Ar-H), 7.89–7.83 (d, 1H, Ar-H), 7.61–7.53 (m, 3H, Ar-H), 7.04–7.25 (m, 9H, Ar-H and NH₂), 4.88 (s, 1H, C-H) ppm.

2.4.7 | 3-Amino-4-(2,4-dichlorophenyl)-1*H*-benzo[*f*]chromene-2-carbonitrile (8 b)

Light Brown; m.p. 228–230 °C; yield 96%; FT-IR (KBr) ν : 3463, 3324, 3190, 2200, 1662, 1557, 1408, 1260, 1187, 1046, 846, 741 cm⁻¹; ¹H-NMR (400 MHz, DMSO-d₆) δ : 7.94 (dd, J = 22.6, 8 Hz, 2H, Ar-H), 7.62 (d, J = 1.7 Hz, 1H, Ar-H), 7.56 (d, J = 8.3 Hz, 1H, Ar-H) 7.49–7.40 (m, 2H, Ar-H), 7.33 (d, 1H, J = 8.9 Hz, Ar-H), 7.26 (dd, J = 10.1, 7 Hz, 1H, Ar-H), 7.11 (s, 2H, NH₂), 7.00 (d, J = 8.2 Hz, 1H, Ar-H), 5.69 (s, 1H, C-H) ppm; ¹³C-NMR (100 MHz, DMSO-d₆) δ : 159.8, 147.1, 141.6, 132.0, 131.9, 131.4, 130.7, 130.0, 129.9, 128.9, 128.7, 128.4, 127.5, 125.1, 122.5, 119.6, 116.8, 114.1 ppm.

2.4.8 | 2-Amino-7-hydroxy-4-phenyl-4*H*-chromene-3-carbonitrile (9 a)

Brown; m.p. 238–240 °C; yield 92%; FT-IR (KBr) ν : 3495, 3424, 3220, 2193, 1654, 1506, 1454, 1302, 1114, 806, 623 cm⁻¹; ¹H-NMR (90 MHz, DMSO-d₆) δ : 9.69 (s, 1H, OH), 7.24–7.19 (m, 5H, Ar-H), 6.86–6.75 (m, 3H, Ar-H), 6.51–6.41 (s, 2H, NH₂), 4.61 (s, 1H, C-H) ppm.

2.4.9 | 2-Amino-7-hydroxy-4-(3-nitrophenyl)-4*H*-chromene-3-carbonitrile (9 b)

Dark brown; m.p. 165–167 °C; yield 94%; FT-IR (KBr) ν : 3472, 3342, 3104, 2195, 1643, 1588, 1460, 1156, 855,

792 cm⁻¹; ¹H-NMR (90 MHz, DMSO-d₆) δ : 9.78 (s, 1H, OH), 8.04–6.82 (m, 7H, Ar-H), 6.47 (s, 2H, NH₂), 4.93 (s, 1H, C-H) ppm.

2.4.10 | 2-Amino-4-(2,4-dichlorophenyl)-7-hydroxy-4*H*-chromene-3-carbonitrile (9 c)

White solid; m.p. 263–265 °C; yield 97%; FT-IR (KBr) ν : 3480, 3341, 3276, 3216, 2194, 1642, 1587, 1412, 1153, 844 cm⁻¹; ¹H-NMR (400 MHz, DMSO-d₆) δ : 9.80 (s, 1H, OH), 7.57 (d, J = 2 Hz, 1H, Ar-H), 7.39 (dd, J = 8.4, 2 Hz, 1H, Ar-H), 7.21 (d, J = 8.4 Hz, 1H, Ar-H), 6.98 (s, 2H, NH₂), 6.71 (d, J = 8.5 Hz, 1H, Ar-H), 6.48 (dd, J = 8.4, 2.4 Hz, 1H, Ar-H), 6.41 (d, J = 2.2 Hz, 1H, Ar-H), 5.12 (s, 1H, C-H) ppm; ¹³C NMR (100 MHz, DMSO-d₆) δ : 160.5, 157.4, 149.0, 141.8, 132.8, 132.2, 129.2, 129.1, 128.0, 120.1, 120.1, 112.6, 111.9, 102.3 ppm.

2.4.11 | 2-Amino-7-hydroxy-4-(thiophen-2-yl)-4*H*-chromene-3-carbonitrile (9 d)

Cream solid; m.p. 240–242 °C; yield 97%; FT-IR (KBr) ν : 3476, 3423, 3332, 3219, 2195, 1654, 1588, 1506, 1327, 1290, 1150, 1043, 867 cm⁻¹; ¹H-NMR (400 MHz, DMSO-d₆) δ : 9.78 (s, 1H, OH), 7.34 (d, J = 4.9 Hz, 1H, Ar-H), 6.96 (d, J = 4.6 Hz, 2H, Ar-H), 6.95 (s, 2H, NH₂), 6.91 (t, J = 4 Hz, 1H, Ar-H), 6.53 (dd, J = 8.3, 2.1 Hz, 1H, Ar-H), 6.39 (d, J = 2.1 Hz, 1H, Ar-H), 4.98 (s, 1H, C-H) ppm; ¹³C NMR (100 MHz, DMSO-d₆) δ : 160.3, 157.3, 151.5, 148.5, 129.8, 126.8, 125.0, 124.0, 120.5, 120.5, 113.5, 112.4, 102.2 ppm.

2.4.12 | 2-Amino-4-(4-fluorophenyl)-7-hydroxy-4*H*-chromene-3-carbonitrile (9 e)

Brown solid; m.p. 202–204 °C; yield 96%; FT-IR (KBr) ν : 3432, 3344, 3281, 2187, 1646, 1505, 1407, 1094, 865, 779 cm⁻¹; ¹H-NMR (90 MHz, DMSO-d₆) δ : 9.71 (s, 1H, OH), 7.19–6.51 (m, 7H, Ar-H), 6.41 (s, 2H, NH₂), 4.65 (s, 1H, C-H) ppm.

2.4.13 | 2-Amino-7-hydroxy-4-(4-tolyl)-4*H*-chromene-3-carbonitrile (9 f)

Brown solid; m.p. 202–204 °C; yield 90%; FT-IR (KBr) ν : 3440, 3339, 3049, 2972, 2191, 1641, 1589, 1464, 1113, 1045, 858 cm⁻¹; ¹H-NMR (90 MHz, DMSO-d₆) δ : 9.33 (s, 1H, OH), 8.46–6.50 (m, 7H, Ar-H), 6.41 (s, 2H, NH₂), 2.25 (s, 3H, CH₃) ppm.

2.4.14 | 2-Amino-5,10-dioxo-4-phenyl-5,10-dihydro-4*H*-benzo[g]chromene-3-carbonitrile (10 a)

Brown solid; m.p. 263–265 °C; yield 91%; FT-IR (KBr) ν : 3400, 3323, 3191, 3021, 2198, 1670, 1405, 1244, 984, 754 cm⁻¹; ¹H-NMR (90 MHz, DMSO-d₆) δ : 8.02–7.84 (m, 4H, Ar-H), 7.30–6.87 (m, 7H, Ar-H and NH₂), 4.61 (s, 1H, C-H) ppm.

2.4.15 | 2-Amino-5,10-dioxo-4-(4-nitrophenyl)-5,10-dihydro-4*H*-benzo[g]chromene-3-carbonitrile (10 b)

Dark-brown solid; m.p. 232–234 °C; yield 97%; FT-IR (KBr) ν : 3397, 3331, 3196, 3075, 2203, 1670, 1521, 1411, 1246, 1183, 859, 780 cm⁻¹; ¹H-NMR (90 MHz, DMSO-d₆) δ : 8.21–7.60 (m, 8H, Ar-H), 7.47 (s, 2H, NH₂), 4.82 (s, 1H, C-H) ppm.

2.4.16 | 2-Amino-4-(2,4-dichlorophenyl)-5,10-dioxo-5,10-dihydro-4*H*-benzo[g]chromene-3-carbonitrile (10 c)

Red-brown solid; m.p. 280–282 °C; yield 97%; FT-IR (KBr) ν : 3467, 3341, 3167, 3073, 2202, 1670, 1592, 1248, 1199, 847, 717 cm⁻¹; ¹H-NMR (90 MHz, DMSO-d₆) δ : 8.35–7.25 (m, 9H, Ar-H and NH₂), 5.12 (s, 1H, C-H) ppm.

2.4.17 | 2-amino-4-(4-chloro-3-nitrophenyl)-5,10-dihydro-5,10-dioxo-4*H*-benzo[g]chromene-3-carbonitrile (10 d)

Red-brown solid; m.p. 255–257 °C; yield 98%; FT-IR (KBr) ν : 3410, 3330, 3218, 2193, 1660, 1593, 1530, 1412, 1245, 716 cm⁻¹; ¹H-NMR (400 MHz, DMSO-d₆) δ : 8.08 (s, 1H, Ar-H), 8.06 (dd, J = 6.5, 2 Hz, 1H, Ar-H) 7.88–7.71 (m, 5H, Ar-H), 7.50 (s, 2H, NH₂), 4.81 (s, 1H, C-H) ppm; ¹³C-NMR (100 MHz, DMSO-d₆) δ : 182.6, 176.9, 158.2, 149.5, 148.1, 134.5, 134.1, 131.1, 131.0, 130.5, 128.3, 126.0, 125.7, 122.6, 122.6, 119.5, 119.5, 112.4 ppm. ESI-MS-M/Z = 406.9 [M]⁺.

2.4.18 | 2-Amino-4-(furan-2-yl)-5,10-dioxo-5,10-dihydro-4*H*-benzo[g]chromene-3-carbonitrile (10 e)

Orange solid; m.p. 257–259 °C; yield 97%; FT-IR (KBr) ν : 3414, 3330, 2197, 1665, 1592, 1420, 1201, 708 cm⁻¹; ¹H-

NMR (400 MHz, DMSO-d₆) δ : 8.04 (dd, J = 5.7, 3.3 Hz, 1H, Ar-H), 7.95–7.84 (m, 3H, Ar-H), 7.53 (d, J = 1 Hz, 1H, Ar-H), 7.43 (s, 2H, NH₂), 6.36 (dd, J = 3.1, 1.9 Hz, 1H, Ar-H), 6.29 (d, J = 3.18 Hz, 1H, Ar-H), 4.76 (s, 1H, C-H) ppm; ¹³C-NMR (100 MHz, DMSO-d₆) δ : 182.2, 176.8, 159.2, 154.5, 149.2, 142.7, 134.7, 130.9, 130.5, 126.2, 125.9, 119.8, 119.7, 119.2, 119.2, 110.7, 106.4 ppm.

2.4.19 | 2-Amino-4-(4-dimethylaminophenyl)-5,10-dioxo-5,10-dihydro-4*H*-benzo[g]chromene-3-carbonitrile (10 f)

Dark-orange solid; m.p. 241–243 °C; yield 94%; FT-IR (KBr) ν : 3336, 3323, 3193, 2798, 2199, 1667, 1524, 1403, 1244, 715 cm⁻¹; ¹H-NMR (400 MHz, DMSO-d₆) δ : 8.04–8.02 (m, 1H, Ar-H), 7.88–7.81 (m, 3H, Ar-H), 7.25 (s, 2H, NH₂), 7.08 (d, J = 8 Hz, 2H, Ar-H), 6.63 (d, J = 8.7 Hz, 2H, Ar-H), 4.48 (s, 1H, C-H), 2.83 (s, 6H, CH₃) ppm; ¹³C-NMR (100 MHz, DMSO-d₆) δ : 182.6, 176.9, 158.2, 149.5, 148.1, 134.5, 134.1, 131.1, 131.0, 130.5, 128.3, 126.0, 125.0, 122.6, 122.6, 119.5, 119.5, 112.4 ppm. ESI-MS-M/Z = 371 [M]⁺.

2.4.20 | 2-Amino-5,10-dioxo-4-(4-tolyl)-5,10-dihydro-4*H*-benzo[g]chromene-3-carbonitrile (10 g)

Dark-brown; m.p. 243–245 °C; yield 94%; FT-IR (KBr) ν : 3407, 3327, 3195, 3247, 2199, 1661, 1593, 1408, 1243, 950, 734 cm⁻¹; ¹H-NMR (90 MHz, DMSO-d₆) δ : 7.99–7.14 (m, 10H, Ar-H and NH₂), 4.44 (s, 1H, C-H), 2.25 (s, 6H, CH₃) ppm.

3 | RESULTS AND DISCUSSION

3.1 | Preparation of the Fe₃O₄@SiO₂-imine/phenoxy-Cu(II) catalyst

Herin, we report the stepwise synthesis of hitherto unexplored Fe₃O₄-supported copper (II) Schiff-base complex Fe₃O₄@SiO₂-imine/phenoxy-Cu(II) as an efficient and recyclable nanocatalyst as explained above (Scheme 2).

First, the silica-coated Fe₃O₄ MNPs were prepared by co-precipitation of ferrous (Fe²⁺) and ferric (Fe³⁺) ions followed by the reaction of dispersion of the resulted nanoparticles in ethanol and deionized water with tetraethyl orthosilicate (TEOS) in the presence of 25% ammonia solution to obtain the core-shell Fe₃O₄@SiO₂

nanoparticles. In the next step, the $\text{Fe}_3\text{O}_4@\text{SiO}_2$ nanoparticles were reacted with (3-chloropropyl) triethoxysilane (CPTES) in dry toluene under nitrogen atmosphere to obtain the chloro-functionalized $\text{Fe}_3\text{O}_4@\text{SiO}_2-(\text{CH}_2)_3\text{-Cl}$ MNPs. Then, the reaction of $\text{Fe}_3\text{O}_4@\text{SiO}_2-(\text{CH}_2)_3\text{-Cl}$ nanoparticles with 1,3-phenylenediamine in ethanol containing few drops of triethylamine under nitrogen atmosphere and refluxed condition furnished the $\text{Fe}_3\text{O}_4@\text{SiO}_2-(\text{CH}_2)_3\text{-NH-(3-NH}_2\text{C}_6\text{H}_4)$ nanoparticles. Conversion of the $\text{Fe}_3\text{O}_4@\text{SiO}_2-(\text{CH}_2)_3\text{-NH-(3-NH}_2\text{C}_6\text{H}_4$ nanoparticles into iminomethyl/phenol Schiff-base derivative $\text{Fe}_3\text{O}_4@\text{SiO}_2\text{-Iminomethyl/phenol}$ was accomplished via the reaction of $\text{Fe}_3\text{O}_4@\text{SiO}_2-(\text{CH}_2)_3\text{-NH-(3-NH}_2\text{C}_6\text{H}_4)$ nanoparticles as a dispersion in methanol with salicylaldehyde in ethanol under refluxed condition and nitrogen atmosphere to obtain the $\text{Fe}_3\text{O}_4@\text{SiO}_2\text{-Iminomethyl/phenol}$ MNPs. Finally, the dispersion of $\text{Fe}_3\text{O}_4@\text{SiO}_2\text{-Iminomethyl/phenol}$ nanoparticles in ethanol was treated with 5% (w/v) solution of $\text{Cu}(\text{OAc})_2$ in ethanol to afford the $\text{Fe}_3\text{O}_4\text{-immobilized Schiff-base Cu(II)}$ complex $\text{Fe}_3\text{O}_4@\text{SiO}_2\text{-imine/Phenoxy-Cu(II)}$. The structure of $\text{Fe}_3\text{O}_4@\text{SiO}_2\text{-imine/Phenoxy-Cu(II)}$ MNPs was fully established by different analytical techniques as described below.

3.2 | Characterization of the $\text{Fe}_3\text{O}_4@\text{SiO}_2\text{-imine/Phenoxy-Cu(II)}$ catalyst

The structure of $\text{Fe}_3\text{O}_4@\text{SiO}_2\text{-imine/Phenoxy-Cu(II)}$ catalyst was fully established by different analytical techniques as described below. The characterization data for the catalyst are available at the end of the article.

3.2.1 | FT-IR analysis

The FT-IR spectra of the naked Fe_3O_4 NPs (a), silica-coated $\text{Fe}_3\text{O}_4@\text{SiO}_2$ NPs (b), $\text{Fe}_3\text{O}_4@\text{SiO}_2-(\text{CH}_2)_3\text{-Cl}$ (c), $\text{Fe}_3\text{O}_4@\text{SiO}_2-(\text{CH}_2)_3\text{-NH-(3-NH}_2\text{C}_6\text{H}_4$ (d), $\text{Fe}_3\text{O}_4@\text{SiO}_2\text{-iminoethyl/phenol}$ (e) and $\text{Fe}_3\text{O}_4@\text{SiO}_2\text{-imine/Phenoxy-Cu(II)}$ (f) presented in Figure 1 are compared. Appearance of the characteristic absorption bands at about 566 and 637 cm^{-1} corresponding to the Fe-O vibrations in all the spectra **1a-f** indicated the successful immobilization of the organic moieties and Cu species on the surface of the Fe_3O_4 nanoparticles. In addition, a broad peak at 3000–3600 cm^{-1} exhibited by these spectra along with another peak at about 1612 cm^{-1} are associated with the O-H stretching vibrations.^[67,68] The absorption band observed at about 1084 cm^{-1} with a small shoulder at 1180 cm^{-1} in the spectra **1b-f** can be attributed to the symmetric and asymmetric stretching vibrations of the Si-O-Si groups which clearly confirm the silica-modification of the nanoparticles. Moreover, the presence of σ -bonded propyl groups on the surface of the Fe_3O_4 was confirmed by the aliphatic C-H stretching vibrations at 2949–2878 cm^{-1} observed in the spectra **1c-f**. Immobilization of the 1,3-phenylenediamine on the surface of the silica-coated Fe_3O_4 nanoparticles was evidenced by the presence of the characteristic N-H stretching band at 3292 cm^{-1} overlapped with the O-H group in the spectrum **1d**. Formation of the immobilized iminomethyl/phenol Schiff-base ligand and its Cu (II) complex were approved by the N-H and C=N characteristic vibrational bands at about 3292 and 1629 cm^{-1} respectively as observed in the spectra **1e** and **1f**. Moreover, the absorption band observed at 459 cm^{-1} in the

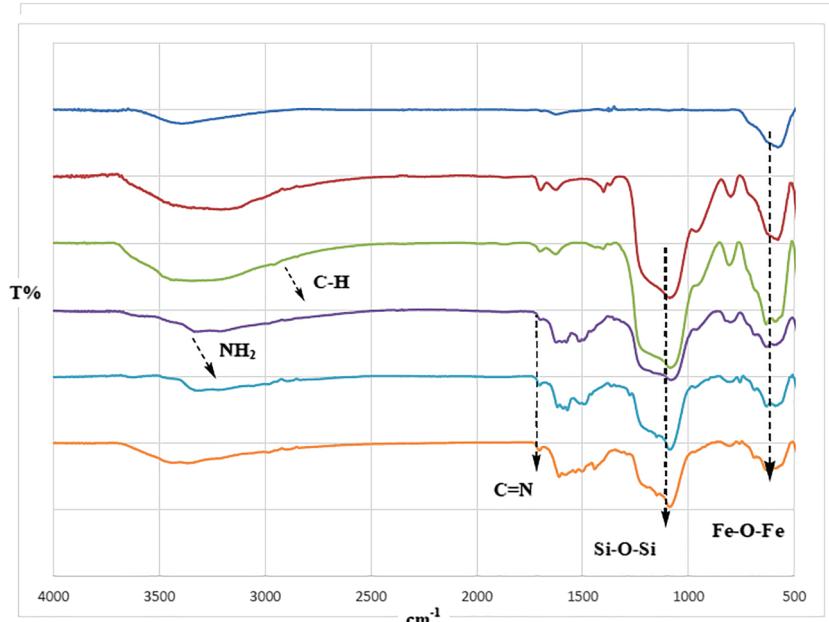

FIGURE 1 FT-IR spectra of (a) naked Fe_3O_4 , (b) $\text{Fe}_3\text{O}_4@\text{SiO}_2$, (c) $\text{Fe}_3\text{O}_4@\text{SiO}_2-(\text{CH}_2)_3\text{-Cl}$, (d) $\text{Fe}_3\text{O}_4@\text{SiO}_2-(\text{CH}_2)_3\text{-NH-(3-NH}_2\text{C}_6\text{H}_4$, (e) $\text{Fe}_3\text{O}_4@\text{SiO}_2\text{-iminoethyl/phenol}$ and (f) $\text{Fe}_3\text{O}_4@\text{SiO}_2\text{-Imine/Phenoxy-Cu(II)}$

spectrum **1 f** can be attributed to the Cu-O stretching vibration. Appearance of additional bands in the range 1170–1600 cm⁻¹ can be assigned to the stretching vibrations of the C=C, C-N, and C-O bonds which further confirm the formation immobilized Schiff-base ligand and its related Cu (II) complex. The slight shift of the C=N absorption frequency to a lower frequency shown in the spectrum **1 f** is likely due to the successful co-ordination of the imminomethyl/phenol Schiff-base ligand to Cu(II) ion.^[69]

3.2.2 | XRD analysis

The crystalline nature and the size of the Fe₃O₄@SiO₂-imine/phenoxy-Cu(II) nanoparticles were determined by X-ray diffraction (XRD) analysis. As indicated in the resulted XRD pattern of the Fe₃O₄@SiO₂-imine/phenoxy-Cu(II) nanoparticles in Figure 2a, the intense Bragg's peaks observed at $2\theta = 18.5^\circ, 30.5^\circ, 35.7^\circ, 43.3^\circ, 53.8^\circ, 57.1^\circ, 62.8$ and 73.8° (2 a) correspond to the (111), (220), (311), (400), (422), (511) and (531) reflection planes, respectively. These peaks are related to the crystal planes in the Fe₃O₄ lattice. The positions and relative intensities of these peaks clearly match with the literature data from the Joint Committee on Powder Diffraction System of Fe₃O₄ (JCPDS Card No. 65-3107). Comparison of the XRD pattern of Fe₃O₄@SiO₂-imine/phenoxy-Cu(II) nanoparticles (2 a) with that of the blank Fe₃O₄ nanoparticles (2 b) proved that the crystalline structure was retained in the Fe₃O₄@SiO₂-imine/phenoxy-Cu(II) nanoparticles after coatation with SiO₂ layer and immobilization with the Schiff-base Cu (II) complex.^[70]

From the XRD pattern can be ascertained the average crystallite size of nanoparticles by applying the Debye-Scherer equation that can be written as: $((D = (K\lambda)/(\beta \cos\theta))^{[71]}$. In this equation, D is the average crystalline and K is a dimensionless shape factor. The shape factor has a typical value of about 0.9, which varies with the actual shape of the crystallite; λ is the X-ray wavelength, β is the line broadening at half the maximum intensity (FWHM) after subtracting the instrumental line broadening in radians, and also θ is the Bragg angle. Eventually, Bragg equation ($d_{hkl} = \lambda/2\sin\theta$) was employed to calculate the distance between the layers (Table 1).

3.2.3 | Energy dispersive X-ray (EDX) and inductively coupled plasma (ICP) analyses

The elemental composition of Fe₃O₄@SiO₂-imine/phenoxy-Cu(II) nanoparticles was determined by EDX.

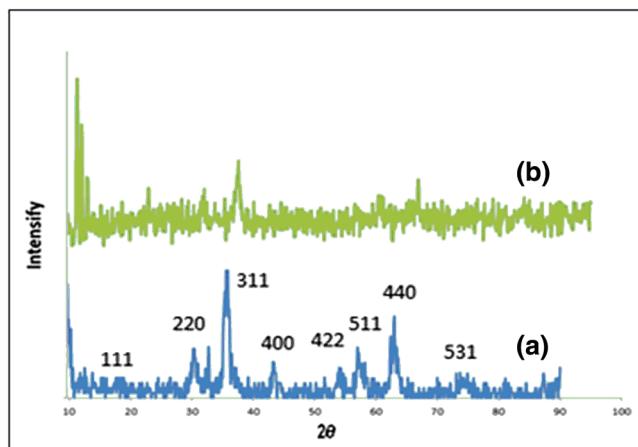

FIGURE 2 XRD patterns of (a) naked Fe₃O₄ MNPs and (b) Fe₃O₄@SiO₂-imine/Phenoxy-Cu(II) MNPs

The presence of Fe, Si, O, N, C and Cu elements with the corresponding weight percent (0.81%, 77%, 0.32%, 0.20%, 0.18%, 0.7%) is clearly evidenced by the EDX spectrum presented in Figure 3. Formation of the Iminomethyl/Phenol Schiff-base and its Cu(II) complex grafted on the surface of the nanoparticles was confirmed by appearance of the peaks due to the N and Cu atoms. In addition, the Cu content of the catalyst was detected and evaluated by ICP-OES which was found to be 11.36 wt%.

3.2.4 | Scanning electron microscopy (SEM) and transmission electron microscopy (TEM)

The morphology and particle size of the Fe₃O₄@SiO₂-imine/phenoxy-Cu(II) nanoparticles were studied by field-emission scanning electron microscopy (FE-SEM) and TEM, respectively. It can be observed from the TEM images shown in Figure 4a that, the encapsulated Fe₃O₄@SiO₂-imine/phenoxy-Cu(II) complex are made up of nanometer-sized particles exhibiting a regularly spherical morphology with the diameters in the range 15–20 nm. Moreover, on the basis of the TEM image shown in Figure 4b, the core-shell structure and the nanometer-sized nature of the Fe₃O₄@SiO₂-imine/phenoxy-Cu(II) particles were obvious. Also, the core-shell structure of the nanoparticles was further approved by the presence of dark spots inside the bright spherical thin silica shell. However, it should be noted that, due to aggregation of the particles with paramagnetic nature, the exact evaluation of the particle size is difficult.

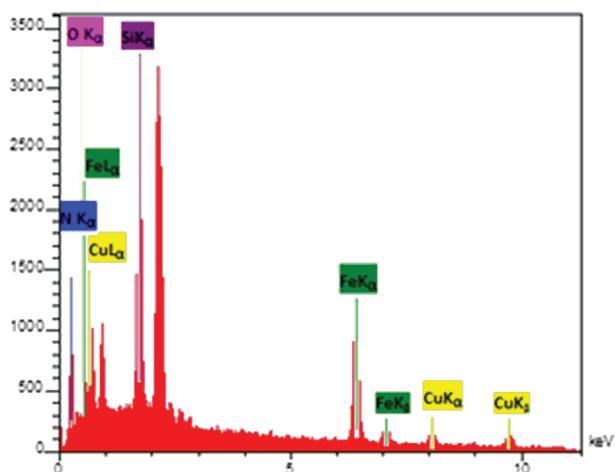

FIGURE 3 The energy dispersive X-ray (EDX) spectrum of $\text{Fe}_3\text{O}_4@\text{SiO}_2$ -imine/Phenoxy-Cu(II) MNPs

3.2.5 | Study of X-ray photoelectron spectroscopy (XPS) of the synthesized $\text{Fe}_3\text{O}_4@\text{SiO}_2$ -imine/phenoxy-Cu(II) nanoparticles

X-ray photoelectron spectroscopy (XPS), also known as electron spectroscopy for chemical analysis (ESCA), is

used to determine quantitative atomic composition and chemistry of the $\text{Fe}_3\text{O}_4@\text{SiO}_2$ -imine/phenoxy-Cu(II) nanoparticles. The discrete peaks observed in the XPS spectra determined in the regions for Si, Fe, N, Fe (Figure 5) correspond to ionization from the core electron orbitals of the atoms in the outermost 10–50 Å of the surface. The results obtained from the analysis of the Si 2p spectra confirmed the presence of binding energies at 103.28 and 103.88 eV corresponding to Si-O-Si and Si-O bonds respectively. Also, the presence of carbon atom in the structure of the nanoparticles was approved by the peaks related to C 1 s at the binding energies of 284.88 (C-O-C), 286.18 (C-O) and 287.58 (C=N) eV.^[72] The nitrogen atoms contained in the grafted Schiff-base group exhibited their N 1 s peaks at the related binding energies 398.68 and 400.28 eV corresponding to C-N and C=N bonds respectively.^[73] Appearance of the Fe 2p_{3/2} and Fe 2p_{1/2} peaks binding energies at 712.68 and 725.38 eV respectively correspond to Fe^{3+} present in the Fe_3O_4 phase. The XPS spectrum resulted in the Fe 2 p v region presented two main binding energy peaks at 710.68 and 724.6 eV which were related to Fe^{2+} .^[74]

XPS spectrum in the Cu 2p region showed a doublet peak located at approximately 933.48 and 952.18 eV which are attributed to Cu 2p_{3/2} and Cu 2p_{1/2}

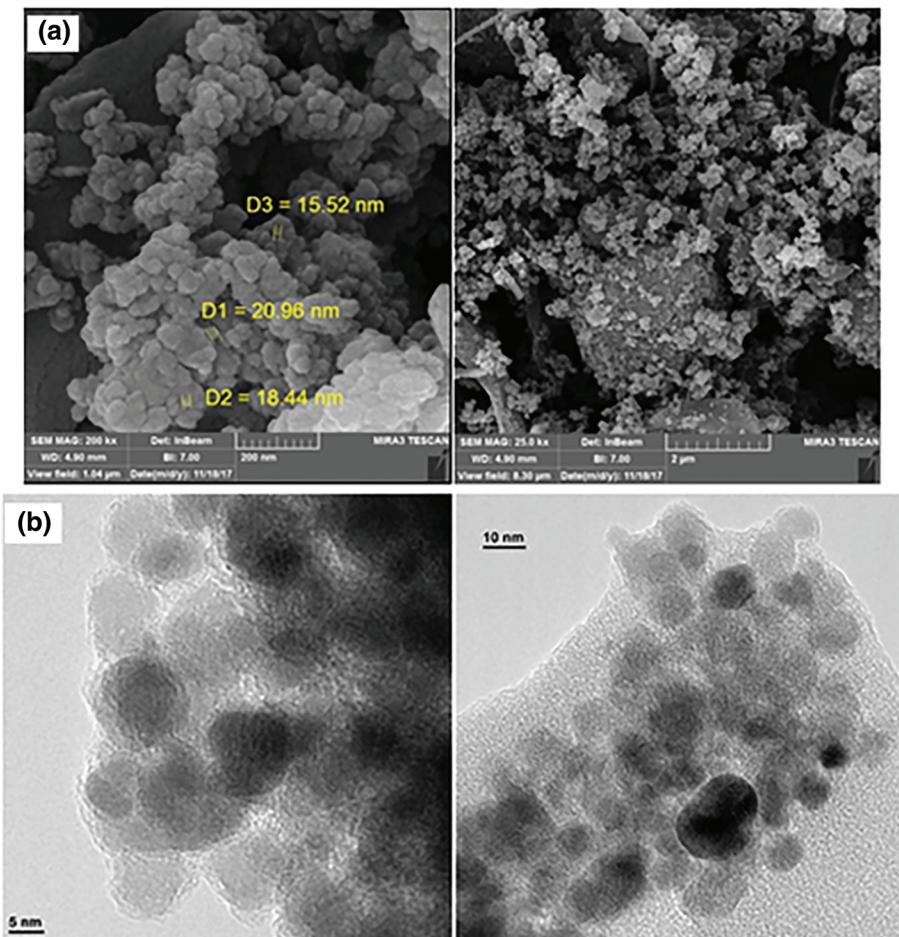

FIGURE 4 (a) SEM and (b) TEM images of the $\text{Fe}_3\text{O}_4@\text{SiO}_2$ -imine/Phenoxy-Cu(II) MNPs

respectively. Also, the doublet peaks with binding energies of 935.08 and 954.58 eV were assigned to Cu 2p_{3/2} and Cu 2p_{1/2} in Cu (II). On the other hand, two shake-up satellite peaks at 941.28 and 944.48 eV are related to Cu (II) species.^[75]

3.2.6 | Vibrating-sample magnetometer (VSM) analysis of $\text{Fe}_3\text{O}_4@\text{SiO}_2$ -imine/phenoxy-Cu(II) nanoparticles

In addition to the above-mentioned XRD, SEM and TEM analyses, the room temperature magnetization behavior was also studied by conducting vibrating-sample magnetometer (VSM) on $\text{Fe}_3\text{O}_4@\text{SiO}_2$ -imine/phenoxy-Cu(II) nanoparticles. The magnetization curves obtained for the naked Fe_3O_4 and $\text{Fe}_3\text{O}_4@\text{SiO}_2$ -imine/phenoxy-Cu(II) nanoparticles are illustrated in Figure 6. As seen in these curves, the specific saturation magnetizations (M_s) of uncoated Fe_3O_4 and $\text{Fe}_3\text{O}_4@\text{SiO}_2$ -imine/phenoxy-Cu(II) nanoparticles are measured to be 54 and 26 emu g⁻¹ respectively. The slight decrease (28 emu g⁻¹) observed in the saturation magnetization value (M_s) of the $\text{Fe}_3\text{O}_4@\text{SiO}_2$ -imine/phenoxy-Cu(II) nanoparticles compared to the M_s value of the bare Fe_3O_4 nanoparticles was most likely attributed to the existence of the coated SiO₂ and Schiff-base Cu(II) (11.36 wt.%) materials on the surface of the Fe_3O_4 nanoparticles.

3.2.7 | Thermal gravimetric analysis (TGA)

Thermal gravimetric analysis (TGA) was applied to the $\text{Fe}_3\text{O}_4@\text{SiO}_2$ -imine/phenoxy-Cu(II) catalyst in order to investigate its thermal stability and verify the existence of the materials immobilized on the surface of the nanoparticles. According to the TGA pattern presented in Figure 7, weight loss takes place in three consecutive

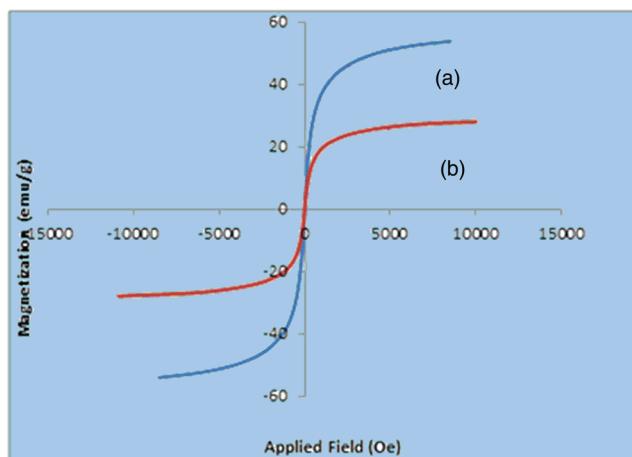

FIGURE 6 Magnetization curves of (a) bare Fe_3O_4 and (b) $\text{Fe}_3\text{O}_4@\text{SiO}_2$ -imine/phenoxy-Cu(II)

steps in thermal range 25–800 °C. The first small weight loss of about 7% occurs below 150 °C which is likely due to the removal of the adsorbed water and remaining organic solvents. The second weight loss of almost 12% in the range 150–450 °C is possibly attributed to the removal of the Fe_3O_4 -grafted organic materials and Cu (II) Schiff base complex. Complete decomposition of the catalyst and the possible change of the crystal phase from Fe_3O_4 to γ - Fe_2O_3 happen in the final thermal step beyond 450 °C.^[76] These results clearly confirm the successful immobilization of the imine/phenoxy derived Schiff-base Cu (II) complex on the surface of the silica-coated Fe_3O_4 MNPs.

3.3 | Catalyst activity of $\text{Fe}_3\text{O}_4@\text{SiO}_2$ -imine/phenoxy-Cu(II) MNPs

In order to evaluate the catalytic activity of the synthesized $\text{Fe}_3\text{O}_4@\text{SiO}_2$ -imine/phenoxy-Cu(II) nanoparticles, we chose to study three-component condensation

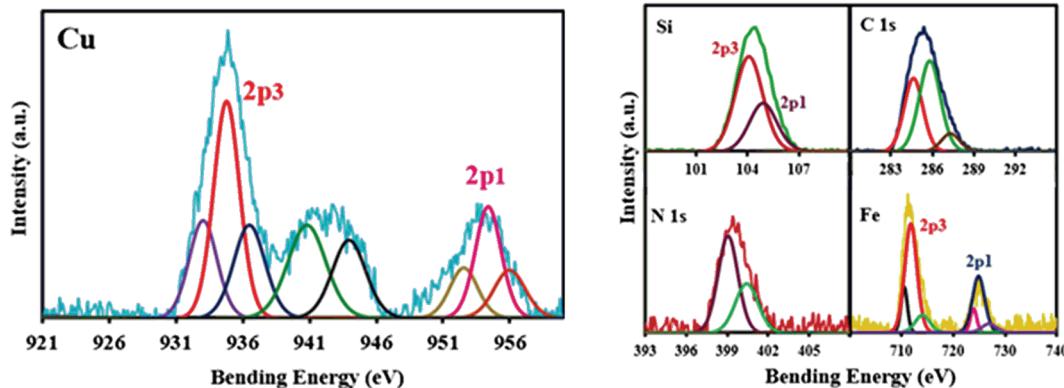

FIGURE 5 The X-ray photoelectron spectroscopy (XPS) spectra of the synthesized $\text{Fe}_3\text{O}_4@\text{SiO}_2$ -Imine/Phenoxy-Cu(II) nanoparticles

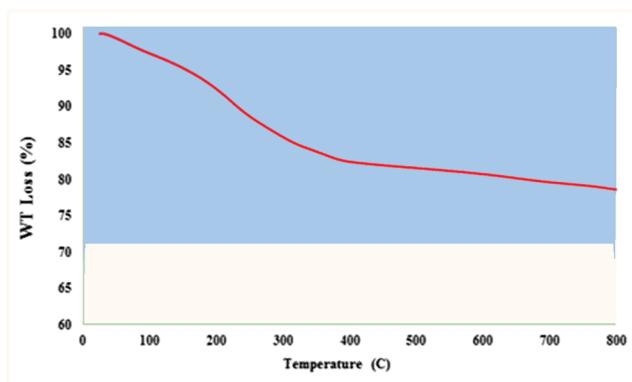

FIGURE 7 TGA curve of $\text{Fe}_3\text{O}_4@\text{SiO}_2$ -imine/phenoxy-Cu(II) MNPs

reactions between the aldehydes, malononitrile, and different phenolic reagents like α -naphthol, β -naphthol, resorcinol, and 2-hydroxynaphthalene-1,4-dione to synthesis various derivatives of 2-amino-4*H*-chromene-3-carbonitrile using $\text{Fe}_3\text{O}_4@\text{SiO}_2$ -imine/phenoxy-Cu(II) nanoparticles as the catalyst (Scheme 1). At first, the effects of different reaction parameters such as catalyst loading, solvent, and temperature on the reaction were screened to establish the conditions of the reactions using the reaction between benzaldehyde, malononitrile and

TABLE 3 Comparative catalytic activity of $\text{Fe}_3\text{O}_4@\text{SiO}_2$ -imine/phenoxy-Cu(II) nanoparticles under optimal conditions

4	Fe_3O_4	35	70

α -naphthol as the model reaction. According to the experimental results summarized in Table 2, the best results in terms of the reaction yield and rate for the selected model reaction were observed when the reaction was performed at 70 °C under solvent-free condition using the catalyst loading of 20 mg (entry 10). Indispensable use of the catalyst $\text{Fe}_3\text{O}_4@\text{SiO}_2$ -imine/phenoxy-Cu (II) in the reaction was established by conducting the reaction under the optimized conditions in the absence of the catalyst and noticed that no detectable amount of the product was produced after a long reaction time (entry 13). Moreover, the catalytic activity of the $\text{Fe}_3\text{O}_4@\text{SiO}_2$ -

^aConditions: aldehyde (1 mmol), malononitrile (1 mmol), phenolic reagent (1 mmol), catalyst (0.02 g), 80 °C.

^bIsolated pure yield.

imine/phenoxy-Cu(II) nanoparticles was compared with the catalytic activities of the bare Fe₃O₄, Fe₃O₄@SiO₂ and Fe₃O₄-supported Schiff-base nanoparticles in separate experiments conducted under the same optimal conditions. The resulting yields given in Table 3 clearly indicated that the Fe₃O₄@SiO₂-imine/phenoxy-Cu(II) nanoparticles perform relatively higher catalytic activity compared with other three nanoparticles.

With the optimized reaction conditions in hand, the scope and generality of the reaction was investigated using a divers series of aromatic aldehydes carrying different substituent groups and various phenolic compounds **4–6**. According to the experimental results summarized in Table 4, all the tested aldehydes reacted smoothly irrespective of the nature of the substituent groups and the resulted 2amino-4*H*-chromene derivatives **7a–e**, **8a–b**, **9a–f** and **10a–g** were produced in excellent yields and short reaction times. The products were structurally characterized by their physical properties and using FT-IR, ¹H NMR, ¹³C NMR, and ESI-MS (in the case of new compounds) spectral analyses and compared with the reported data.

3.4 | Proposed catalytic reaction

A plausible mechanism for three-component reaction of aldehydes, malononitrile and different phenolic compounds for the synthesis of the corresponding 2-amino-4*H*-chromene derivatives is suggested in Scheme 3. Likely, the initial step involves the

condensation reaction between the aldehyde and malononitrile in the presence of Fe₃O₄@SiO₂-imine/phenoxy-Cu(II) as a Lewis acid catalyst to generate arylidemalononitrile (**I**). In the following step, the resulted intermediate (**I**) undergoes a Michael-type addition reaction with the phenolic species (α -naphthol, β -naphthol, resorcinol or 2-hydroxynaphthalene-1,4-dione) under the catalytic acceleration to produce the adduct (**II**). Finally, enolization of (**II**) occur to yield the intermediate (**III**) which undergoes intramolecular nucleophilic cyclization to afford the respective products **7–10**.^[71]

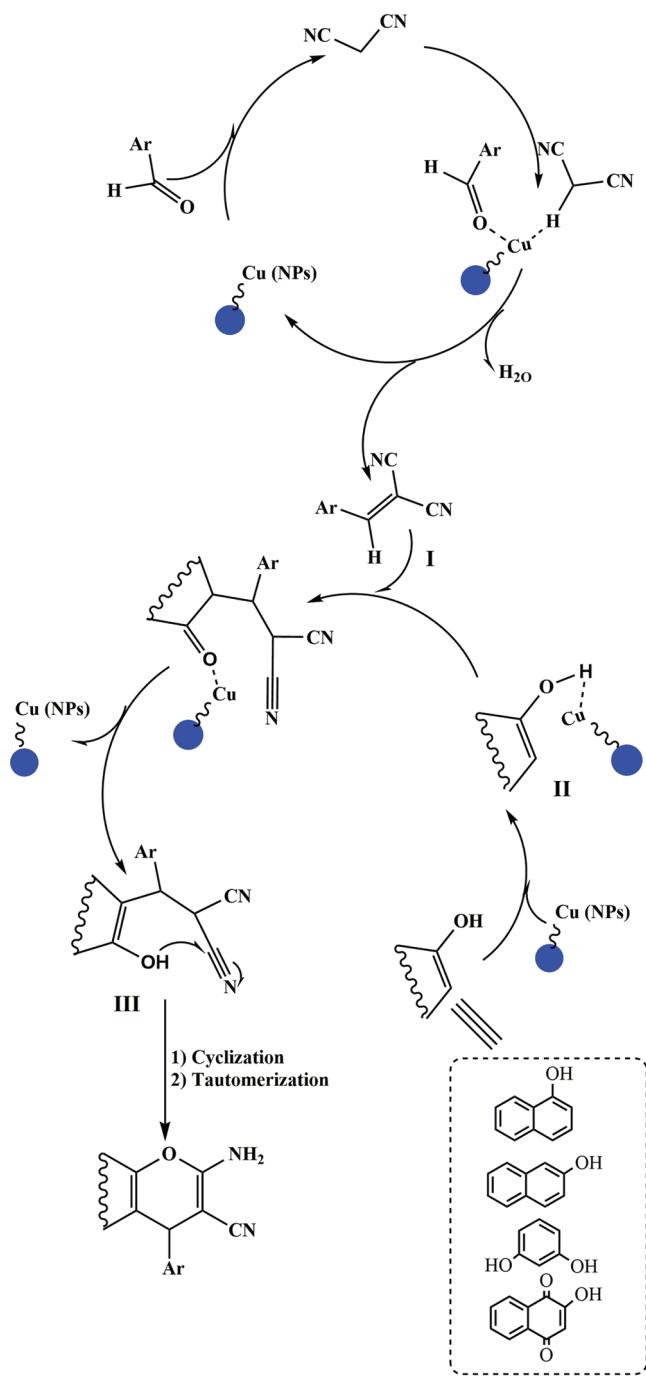

3.5 | Catalyst recyclability

We examined the recycling and reusability of the Fe₃O₄@SiO₂-imine/phenoxy-Cu(II) catalyst for the model reaction between benzaldehyde, malononitrile and α -naphthol under the optimized conditions. After completion of the reaction, the catalyst was separated magnetically using a magnet. The isolated nanoparticles were washed with ethanol and water several times, oven-dried at 60 °C, and reused for five successive runs with no significant loss of activity (Figure 8).

4 | THEORETICAL STUDIES

Theoretical calculations were performed to analyze the optimization of the molecular structures of 2-amino-4*H*-

chromene derivatives by using density functional theory (DFT)/B3LYP method. The most important geometrical parameters of the target compounds are quoted in Table 5. The frontier molecular orbitals, *i.e.* the highest occupied molecular orbital (HOMO) and the lowest unoccupied molecular orbital (LUMO), of 2-amino-4*H*-chromene derivatives are presented as Figure 1 in

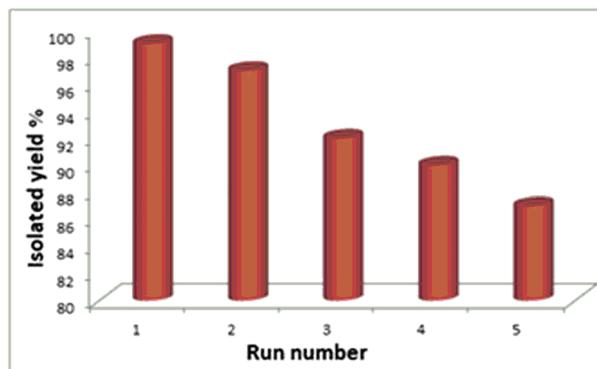

S C H E M E 3 A plausible pathway for one-pot synthesis of 2-amino-4*H*-chromenes catalyzed by $\text{Fe}_3\text{O}_4@\text{SiO}_2$ -imine/phenoxy-Cu(II) MNPs

supplementary data. In addition, some considerable electronic features such as calculated bond lengths, dipole moments and energies of the HOMO and LUMO for all 2-amino-4*H*-chromene derivatives are listed in Table 5. As can be seen from this table, the higher negative charge density in the HOMO molecular orbitals, was found to be around the nitrogen atoms of the NH_2 and CN groups in 2-amino-4*H*-chromene derivatives. This observation implies the increased probability of nucleophilic attack of these groups at the metal ion. Moreover, the negative charge density of LUMO molecular orbitals has been nearly delocalized over the entire molecule. The higher energy of HOMO and the lower energy of LUMO facilitate the interaction between the electron-donor and electron-acceptor units.

5 | CONCLUSIONS

In the present research, we report for the first time the preparation of a new Cu(II) Schiff-base complex immobilized on silica-coated Fe_3O_4 magnetic nanoparticles. The prepared $\text{Fe}_3\text{O}_4@\text{SiO}_2$ -imine/phenoxy-Cu(II) catalyst was structurally characterized by FT-IR, SEM, TEM, EDX, XRD, TGA, XPS, VSM and ICP-OES analytical techniques. These newly prepared nanoparticles were explored as efficient heterogeneous Lewis acid catalyst for the synthesis of various 2-amino-4*H*-chromene derivatives via one-pot three-component reactions between aldehydes, malononitrile and phenolic reagents such as α -naphthol, β -naphthol, resorcinol and 2-hydroxynaphthalene-1,4-dione under green solvent-free condition. Moreover, this catalyst can be easily recycled and reused for five times without significant loss of catalytic activity.
