Abstract: A novel series of 2-benzothienyl carbonyl arylpiperazines (**6a**–**f**) was synthesized as potential HIV nonnucleoside reverse transcriptase inhibitors (NNRTIs). Preparation of the derivatives was performed by reacting benzo[*b*]thiophene carbonyl chloride (**5**) with a series of substituted 4-arylpiperazines.

Keywords: arylpiperazines, benzothiophene, delavirdine, HIV-1 reverse transcriptase inhibitors

INTRODUCTION

Heteroaryl amides bearing an arylpiperazine moiety are interesting frameworks utilized in antipsychotic drugs and HIV nonnucleoside reverse transcriptase inhibitors (NNRTIs), such as delavirdine (Fig. 1).[1–6] As a retrovirus, HIV is distinguished by the presence of a viral reverse transcriptase (RT), an enzyme responsible for the synthesis of DNA from the viral RNA genome. enzyme is one of the most important antiviral targets in the chemotherapy of acquired immunodeficiency syndrome (AIDS). Reverse transcriptase inhibitors of HIV-1 have successfully been used in combination with HIV-1 protease inhibitors as a treatment regimen termed highly active antiretroviral therapy (HAART),[7,8] in which efavirenz, nevirapine, and delavirdine are the NNRTIs agents currently used.

A major drawback with AIDS drugs is the rapid development of resistance;[9] thus, continued efforts need to be focused on the synthesis of new compounds with enhanced activity or metabolic stability. In 2001, Pinna and coworkers[10] reported the synthesis and pharmacological evaluation of a series of arylpyrrol piperazines as delavirdine analogs in acutely infected MT4 cells.

Although a number of synthetic approaches to molecules with potential NNRTI activity have been reported,[11–13] the preparation of arylpiperazinil benzo[*b*]thiophene derivatives as potential anti-HIV-1 agents has not yet been investigated to the best of our knowledge.

The present study describes the synthesis of a series of 1-[(4,7-dimethoxy-1-benzothien-2-yl)carbonyl]-4-arylpiperazines **6**(**a**–**f**) structurally related to the NNRTI delavirdine.

RESULTS AND DISCUSSION

The synthesis of 2-benzothienyl arylpiperazines **6**(**a**–**f**) is outlined in Scheme 1. Treatment of the starting 2,5-dimethoxy benzaldehyde (**1**) with nitric acid in glacial acetic acid gave the corresponding nitro compound, (**2**),[14] which reacted with methyl thioglycolate in basic medium at 65–70°C to provide the benzo[*b*]thiophene ester (**3**)[15] in 74% crude yield.

The ester (**3**) was subsequently hydrolyzed at room temperature in a methanolic potassium hydroxide solution to afford the heteroaromatic carboxylic acid derivative (**4**) in 82% yield. The aroylchloride (**5**) was obtained by reaction of acid (**4**) with thionyl chloride under reflux conditions to provide a yellow solid, which was purified and subsequently treated under an inert atmosphere with different 4-arylpiperazines to afford the expected benzothiophene carboxamides in good yield (Table 1).

Chemical shifts were recorded in ppm (δ) relative to TMS as an internal standard. *J* values are given in Hertz. Microanalyses were carried out on a Fisons EA 1108 analizer. Silica-gel 60 (Merck, 70–230 mesh) and DC-alufolien 60 F_{254} were normally used for column chromatography and thin-layer chromatography (TLC) respectively.

4,7-Dimethoxy-2-methoxycarbonyl-benzo[*b*]thiophene (3)

To a solution of nitrobenzaldehyde **2** (774 mg, 3.7 mmol) in DMF (10 mL), anhydrous K_2CO_3 (507 mg, 3.7 mmol) and methylthioglycolate (0.34 mL, 3.7 mmol) were added. The suspension was stirred at 70°C for 4 h, then poured onto crushed ice, and vigorously stirred for 15 min. The resultant precipitate was filtered off and washed with water (3 × 25 mL) to afford crude benzothiophene ester **3** (682 mg, 74%) as a pale yellow solid, which was purified by column chromatography (CH_2Cl_2) to afford pure benzothiophene ester **3** (623 mg, 67.4%), mp 124–125°C. [(4,7-Dimethoxy-1-benzothien-2-yl)carbonyl]-4-phenylpiperazine (6a)

Aroyl chloride **5** (277 mg, 1.08 mmol) in dry THF (20 mL) was slowly added to a stirred solution at 0°C of 1-phenylpiperazine (175 mg, 1.08 mmol) and dry pyridine (85 mg, 1.08 mmol) in dry THF (50 mL) under a nitrogen atmosphere. The mixture was maintained with stirring for 3 h at room temperature and then diluted with water (100 mL). The solution was extracted with ethyl acetate (3×50 mL), and the organic layers were dried over $MgSO_4$. Concentration of the solvent in vacuo afforded a residue, which was purified by silica-gel column chromatography (CH_2Cl_2) to give benzothiophene carboxamide **6a** (345 mg, 83.4%) as a yellow pale solid, mp 156–157°C (EtOH).
