1. Introduction

The major bioactive compounds extracted from licorice roots (Glycyrrhizae glabra) are glycyrrhizin and its natural metabolite glycyrrhetinic acid (GA), which have been used for a long time in traditional medicines for the treatment of allergic, pulmonary, and hepatic ailments.¹⁻⁴ The broad spectrum of activities comprises antiinflammatory, cytotoxic, antiulcer, antiproliferative, antioxidative, and endocrine activities.^{5–9} GA as well as the hemisuccinate ester carbenoxolone are potent inhibitors of 11β-hydroxysteroid dehydrogenase 1 and 2.10-13 Numerous modifications in the ring skeleton of the oleanolic acid backbone have been performed.¹⁴ With respect to ring A modification, most approaches have focussed on the modification of position 3 of GA by oxidation, followed by reductive amination, as well on utilization of the 2,3-dehydro derivative.^{15–17} These studies succeeded in introducing O-, N-, and C-linked appendices into ring A as well as affording halide-substituted derivatives.^{5,6,18} Furthermore, sulfone and phosphonate moieties have been installed in ring A of GA.¹⁹ Within the framework of ongoing studies aimed at the development of selective inhibitors of 11β-hydroxysteroid dehydrogenase 1 and 2 we have set out to synthesize thio derivatives

ABSTRACT

A general method for the introduction of thiol groups at positions 1, 2, and 3 of glycyrrhetinic acid has been developed starting from a protected 2α , 3α -oxido-derivative. Conversion into the corresponding 2β , 3β -epithio-derivative was followed by ring-opening leading to either 2- or 3-substituted thio derivatives. Conversely, 3α -configured allylic alcohol intermediates derived from the 2,3-epoxide provided efficient access to both diastereoisomeric 3-thio derivatives as well as 1α -thio derivatives. The stereochemistry of the newly formed stereogenic centers was rigorously proven using X-ray crystallography. © 2010 Elsevier Ltd. All rights reserved.

> of glycyrrhetinic acid modified at positions 1, 2, and 3 of ring A, to be used as versatile educts for further modification by alkylation, acylation as well as glycosylation protocols. The major approaches described herein utilize the known 2,3-oxido derivative of GA as the central intermediate as well as the novel $2\beta_3\beta$ -epithio compounds followed by allylic rearrangement reactions and full deprotection.

2. Results and discussion

The previously described²⁰ diphenylmethyl ester derivative **1** was converted into the crystalline 3-*O*-*p*-toluenesulfonyl derivative **2** in 99% yield by reaction with *p*-toluenesulfonyl chloride in pyridine. Subsequent elimination was effected by treatment of **2** with tetrabutyl ammonium iodide in DMF at 100 °C, which afforded the 2,3-diene derivative **3** as crystalline material in 91% yield. In addition, a small amount of the fully deprotected diene **4**, formed during the reaction, was isolated by silica gel chromatography. The NMR spectral characteristics of **4** are consistent with previously published data of the 2,3-dehydro methyl ester of glycyrrhetinic acid and also agree with the data of the free acid derivative.^{17,21} Reaction of the diene derivative **3** with *m*-chloroperbenzoic acid was performed in a multigram scale and furnished the crystalline 2α ,3 α -oxido derivative **5** (Scheme 1). The crystal structure of the epoxide **5** (Fig. 1) unambiguously established the stereochemistry

at C-2 and C-3, thereby confirming the previously reported assignment of an epoxide generated from the methyl ester of glycyrrhetinic acid.¹⁷ The NMR data of **5** also confirm the previous assignments of 2α , 3α - and 2β , 3β -oxido triterpenoid derivatives, which had been based on B3LYP/631G*//MM⁺ and DFT calculations.²² Since the ¹H NMR chemical shift values as well as the homonuclear coupling constants are similar for both configurations, ¹³C NMR chemical shift arguments had been employed to assign the epoxide configuration. Indeed, the ¹³C NMR chemical shift values for C-1 (δ 41.02), C-2 (δ 52.51, Table 1) and C-5 (δ 46.51) of the 2α , 3α -epoxide **5** were in very close agreement with the published values for a related 2α , 3α -epoxide triterpene derivative.²² Using the free acid derivative **4** in a similar reaction gave the epoxide derivative **6** in 53.5% isolated yield. The epoxide **5** provided a versatile starting material for numerous chemical modifications of ring A of glycyrrhetinic acid. Thus, the diphenylmethyl ester derivative **5** was reacted with triphenylphosphine and iodine in dichloromethane followed by acetylation with acetic anhydride/pyridine/ DMAP.²² The resulting acetylated iodohydrin **7** was isolated in 85% yield and its crystal and molecular structure was determined. The structure of **7** (Fig. 2) revealed the presence of a twist boat conformation for ring A, which was also reflected in a large value of the coupling constant of $J_{2,3}$ (12.6 Hz). Removal of the diphenylmethyl ester group from **7** was accomplished using trifluoroacetic acid to generate the benzylium cation, which was trapped by anisole to afford the acid derivative **8**, isolated by silica gel chromatography in 72.5% yield. The elimination reaction of **7** in the presence of 1,8diazabicyclo[5.4.0]undec-7-ene (DBU) afforded the 1,2-dehydro derivative **9** in 83% yield. Removal of the 3-O-acetyl group under alkaline conditions furnished the allylic alcohol **10** in 90% yield.

Figure 2. Crystal structure of iodohydrin 7 as 7·H₂O. H-atoms omitted for clarity except for the hydrogen bonded water molecule on upper left. C2–I1=2.166(2) Å, C3–O1=1.454 (2) Å, 11–C2–C3–O1 46.1(2)°.

For the synthesis of the corresponding C-29 acid derivative **12**, the 2-iodo derivative **8** was subjected to the elimination step to provide the 3-O-acetyl derivative **11** (72% yield), which was subsequently deacetylated under alkaline conditions to give the acid derivative **12** in 87% yield. Hydrogenation of the allylic 3-O-acetyl derivative **9** in the presence of Pd–C afforded the 3 α -acetyl derivative **13** of 18 β -glycyrrhetinic acid. The low-field shifted signal of H-3 of **13** showed small homonuclear coupling constants to the neighboring H-2 protons being diagnostic for the equatorial position of H-3 thereby verifying the configurational assignment for compounds **9–12**. The allylic system present in ring A of this series provides also a versatile entry into the corresponding 1 α -series via an allylic rearrangement reaction. Thus, deprotection of the diphenylmethyl ester group of compound **9** using trifluoroacetic

acid/anisole followed by transesterification with methanolic NaOMe afforded compound **14** in 82% yield. The α -configuration of C-1 was substantiated following hydrogenation of the double bond in ring A, which furnished the 1α -hydroxy isomer of glycyrrhetinic acid **15** in 85% yield. The ¹H NMR signal of H-1 of **15** appeared as a broadened triplet with coupling constants of 2.8 Hz, again proving its equatorial arrangement. The migration of the hydroxy group to position 1 was further inferred from the observed HMBC-correlations of the low-field shifted C-1 ¹³C NMR signal to the signals of the methyl group at position 25 and H-9, respectively. The introduction of the 1 α -hydroxy group also led to a substantial low-field shift of H-9 seen in the ¹H NMR spectrum as well as a β -shift of the ¹³C NMR signal of C-9 in compound **14** (δ 53.09) and **15** (δ 53.32, Table 1), respectively. The 1 α -hydroxylation of 4,4-dimethyl-2-ene

triterpene derivatives has previously been accomplished via SeO_2 oxidation of the corresponding 2-ene derivatives.²³

Acid-catalyzed ring-opening of the 2,3-oxide derivative **5** with concomitant removal of the diphenylmethyl ester group gave the known diol derivative **16** in 70% yield (Scheme 2).^{24,25} The 2,3-epoxide **5** was used as starting material for the introduction of thiol groups at positions 1, 2 and 3 of ring A, respectively (Scheme 2). Reaction of **5** with *N*,*N*-dimethylthioformamide in toluene at 45 °C in the presence of TFA produced the crystalline 2,3-epithio derivative **17** in 80% yield.²⁶ The crystal and molecular structure of the epithio compound **17** could be solved and revealed the inverted

configuration at C-2 and C-3 in contrast to the epoxide **5** (Fig. 3). The use of higher temperatures (80 °C) gave an increased amount of the ring-opened derivatives **18** and **19** (30% and 35%, respectively) in addition to the thiirane **17** (20%). Acetolysis of the thiirane derivative **17** using a 1:1 mixture of acetic acid-acetic anhydride produced the diacetate **20** in 70% yield, whereas treatment of **17** with acetic anhydride in pyridine afforded compound **20** in 92% yield. The stereochemical features of the resulting 2β -S-acetyl-3 α -O-acetyl product were unambiguously proven by the crystal structure of **20** (Fig. 4). Similar to the crystal structure of the 2-iodo-3-O-acetyl derivative **7**, ring A was present in a twist boat

conformation, thereby leading to a deceptive, large homonuclear coupling constant for H-2 and H-3 ($J_{2,3}$ 11.7 Hz). Selective deace-tylation of the 2-S-acetyl group of **20** was effected by reaction with hydrazine hydrate to give the 2 β -thiol derivative **21** in 94% yield.

Deprotection of the diphenylmethyl ester group using TFA– anisole furnished the acid derivative **22** in 93% yield. Attempted de-O-acetylation of **22** under alkaline conditions, however, was unsuccessful and resulted in reformation of the thiirane ring giving **24** in 80% yield. The epithio compound **24** was also prepared—although in lower yield (40%)—by direct conversion of the 2,3epoxide derivative **6** by treatment with DMTF/TFA.

Finally, the epithio compound **17** also served as the educt for producing a series of 3-thio substituted derivatives with inverted configuration at C-2. Reaction of **17** with CoCl₂/acetyl chloride or CoCl₂/acetyl bromide gave the corresponding 2α -halo- 3β -thio-acetyl derivatives **25** and **26** in 43% and 33% yield, respectively.²⁷ In the former reaction, a small portion of the elimination product **3** was isolated (10%), whereas in the latter reaction the major product isolated had resulted from cleavage of the diphenylmethyl ester group under the acidic conditions giving the 2-bromo acid **27**. Again, the configurational assignments were corroborated from the solved crystal structure of compound **27** (Fig. 5), which revealed the presence of the chair conformation of ring A in accordance with the observed ¹H NMR spectral characteristics of *trans*-oriented vicinal protons (J_{2,3}=12.0 Hz). The allylic alcohol **10** was used as educt for

the presence of the 3β substitution product as the major isomer (ratio ~ 7:3). The configuration at C-3 of the minor isomer was inferred from the value of the homonuclear coupling constant $J_{2,3}$, which was in a similar range (5.4 Hz) as observed for the 3α -derivatives **9–12**

Figure 5. Crystal structure of 27. C2–Br1=1.969(4) Å, C3–S1=1.829(5) Å, S1–C31=1.758(6), Br1–C2–C3–S1=–57.4(4)°.

the installment of thiol groups at positions 1 and 3, respectively (Scheme 3). Reaction of **10** with DMF–dineopentylacetal and thioacetic acid²⁸ in dichloromethane at elevated temperature afforded the 3-epimeric *S*-acetyl derivative **28** and the 1 α -*S*-acetyl derivative **32** in yields of 35% and 50%, respectively, after chromatographic separation.

The structural assignments of the regioisomers **28** and **32** was based upon the identification of the thio-substituted carbons at δ 54.00 and δ 50.91 (Table 2), respectively, followed by their HMBC-correlation to either the methyl groups at position 23 and 24 or the C-25 methyl group, respectively. Formation of the 1 α -thioisomer is presumed to occur via a similar pathway as observed for the 1 α -allylic alcohol **14**. The epimeric mixture of the 3-thio compounds, however, could not be resolved by chromatography. The ¹H NMR data indicated

(4.8–6.2 Hz), whereas the corresponding values were smaller for the β -isomeric forms (~2 Hz), being indicative of a pseudoaxial orientation of H-3 in a half-chair conformation in the latter case (Fig. 6).

Treatment of **32** with hydrazine hydrate afforded the 1 α -thiol compound **33** in 95% yield. Similarly, the 3-*S*-acetyl derivative **28** was converted into the 3 α ,3 β -thiol derivative **29** in 90% yield. Finally, the diphenylmethyl ester groups were cleaved without affecting the *S*-acetyl groups using TFA—anisole to give the free acid derivatives **30** and **34** in 90% and 85% yield, respectively. Eventually, the fully deprotected compounds **31** and **35** were generated from **30** and **34** by hydrazinolysis in yields of 70% and 90%, respectively. The ¹³C NMR data (Tables 1 and 2) closely match previous assignments made for glycyrrhizin.²⁹ Major chemical shift deviations are observed for ring A carbons and the neighboring Me-groups at

3. Conclusion

Introduction of thiol groups into ring A of glycyrrhetinic acid has been achieved in gram-scale utilizing the ester protected as well the acidic 2,3-oxido derivative as educts. Conversion into the corresponding 2,3-epithio derivatives with inverted configuration was followed by ring-opening to provide either 2β -thio- as well as 3β -thio- equipped derivatives. Finally, an allylic 3α -hydroxy intermediate—again conveniently accessible from the 2,3oxido intermediate—may be transformed into 1α -configured as well as 3α , 3β -thio analogs.

4. Experimental section

4.1. General methods

Glycyrrhetinic acid ester derivative 1 was prepared according to published procedures.²⁰ Concentration of solutions was performed at reduced pressure at temperatures<40 °C. Dichloromethane was dried by stirring with CaH₂ (5 g per L) for 16 h, then distilled and stored under Ar over molecular sieves 0.4 nm. Column chromatography was performed on silica gel 60 (230–400 mesh. Merck). Analytical TLC was performed using silica gel 60 F254 HPTLC plates with 2.5 cm concentration zone (Merck). Spots were detected by treatment with anisaldehyde-H₂SO₄. Ion exchange treatment was performed on Dowex 50 WX8 resin, H⁺ form, 50-100 mesh. Melting points were determined on a Kofler hot stage microscope and are uncorrected. Optical rotations were measured with a Perkin-Elmer 243 B polarimeter. NMR spectra were recorded at 297 K in CD₃OD and CDCl₃ with a Bruker DPX 300 or Avance 400 spectrometer (¹H at 300.13 MHz, ¹³C at 75.47 MHz or ¹H at 400.13 MHz, ¹³C at 100.62 MHz, respectively) using standard Bruker NMR software. ¹H NMR and ¹³C NMR spectra were referenced to internal tetramethylsilane (δ =0). ¹³C NMR signals of the glycyrrhetinic acid scaffold are compiled in Tables 1 and 2. For MS analyses, samples were dissolved in MeCN ($\sim 1 \text{ nmol}/\mu L$). An aliquot of the sample was diluted in 50% aq MeCN containing 0.1% formic acid to give a final concentration of $\sim 10 \text{ pmol}/\mu\text{L}$. This solution was subjected to offline ESI Q-TOF MS on a Waters Micromass Q-TOF Ultima Global. Capillary voltage was adjusted to obtain approx. 200 counts/s. The MS had been previously tuned with [Glu1]-fibrinopeptide B to give the highest sensitivity and a resolution of ca. 10.000 (FWHM). Mass tuning of the TOF analyzer was done in the tandem MS mode using again [Glu1]-fibrinopeptide B.

4.1.1. Diphenylmethyl 3β -p-toluonesulfonyloxy-11-oxo-18 β -olean-12-en-29-oate (**2**). A cooled solution of *p*-toluenesulfonyl chloride (31.4 g, 0.165 mol) in dry pyridine (65 mL) was added dropwise at 0 °C to a solution of **1** (30 g, 47.1 mmol) in dry pyridine (150 mL). The reaction mixture was stirred at rt overnight. The solution was poured onto ice-water, stirred for 30 min and diluted with dichloromethane (200 mL). The organic layer was washed with 0.1 M HCl, water, and satd aq NaHCO₃ and brine. The organic phase was dried (Na₂SO₄) and concentrated. Purification of the residue by MPLC (5:1 toluene/EtOAc) afforded **2** as a colorless solid. Yield: 37 g (99%). Crystallization from 10:1 EtOH/EtOAc gave colorless crystals. Tetra-n-butylammonium iodide (910 mg, 2.47 mmol) was added to a solution of 2 (4.0 g, 5.06 mmol) and sodium iodide (3.26 g, 21.74 mmol) in DMF (40 mL) and the reaction mixture was stirred overnight at 100 °C. After cooling to rt, the reaction mixture was diluted with dichloromethane (100 mL) and washed with 5% aq $Na_2S_2O_3$, NaHCO₃, and brine. The aqueous layer was washed once more with EtOAc, the organic phases were combined, dried (Na₂SO₄) and concentrated. The residue was coevaporated three times with toluene and purified by flash chromatography (6:1 *n*-hexane/ EtOAc) to afford **3** (2.85 g, 91%) as a colorless solid. 4.1.11. Hydrogenation of 9. A solution of 9 (30 mg, 0.044 mmol) in dry methanol (4 mL) was hydrogenated in the presence of 10% Pd–C (30 mg) at rt and atmospheric pressure for 15 h. The catalyst was filtered over a layer of Celite and the filtrate was concentrated. Purification of the residue on silica gel (50:1 CH₂Cl₂/EtOH) gave 13 as amorphous solid. Yield: 18 mg (80%). ¹H NMR (CDCl₃, 400 MHz): δ 5.72 (s, 1H, 12-H), 4.64 (dd, J_{3,2a}=J_{3,2b} 3.2 Hz, 1H, 3-H), 2.56 (ddd, J_{1a,b} 13.2, J_{1a,2} 3.6 Hz, 1H, 1a-H), 2.47 (s, 1H, 9-H), 2.19 (br dd, J_{18.19b} 13.6, J_{18,19a} 3.2 Hz, 1H, 18-H), 2.07–1.81 (m, 5H, 16a-H, 21a-H, 2a-H, 19a-H, 15a-H), 1.72 (ddd, 1H, 7a-H), 1.645 (t, J_{19a,19b} 13.6 Hz, 1H, 19b-H), 1.56 (dddd, 1H, 2b-H), 1.50-1.16 (m, 9H, 6a-H, 6b-H, 7b-H, 22a-H, 22b-H, 21b-H, 1b-H, 5-H, 15b-H), 1.04 (ddd, 1H, 16b-H), 1.43 (s, 3H, 27-CH₃), 1.23 (s, 3H, 30-CH₃), 1.17 (s, 3H, 25-CH₃), 1.14 (s, 3H, 26-CH₃), 0.92 (s, 3H, 23-CH₃), 0.86 (s, 3H, 24-CH₃), and 0.84 (s, 3H, 28-CH₃). ¹³C NMR (CDCl₃/CD₃OD, 100.62 MHz): δ =170.74 (CH₃CO) and 21.36 (CH₃CO).

4.1.12. 1α-Hydroxy-11-oxo-18β-olean-2,12-dien-29-oic acid (**14**). A solution of **9** (100 mg, 0.158 mmol) in dichloromethane (5 mL) was stirred with trifluoroacetic acid (0.2 mL) and anisole (0.1 mL) at rt for 12 h. The solution was concentrated and the residue was purified by silica gel chromatography (1:1 *n*-hexane/EtOAc). Product-containing fractions were pooled and concentrated. The residue was dissolved in dry MeOH (5 mL) and treated with 0.1 M methanolic NaOMe (0.1 mL) for 4 h at rt. The solution was made neutral by addition of Dowex 50H⁺ cation exchange resin and filtered. The filtrate was concentrated and purified by silica gel chromatography (1:1 *n*-hexane/EtOAc) to afford **14** as colorless amorphous solid. Yield: 60 mg (82%). 4.1.14. $2\beta_{,3\alpha}$ -Dihydroxy-11-oxo-18 β -olean-12-en-29-oic acid (**16**). Compound 5 (150 mg, 0.236 mmol) was dissolved in toluene (5 mL) and a solution of TFA (200 µL, 2.481 mmol) in toluene (2 mL) was added dropwise at rt. The mixture was stirred at 40 °C for 2 h. The reaction mixture was coevaporated with toluene three times and the residue was dissolved in dry MeOH (5 mL). 0.1 M Methanolic NaOMe (0.1 mL) was added and the reaction mixture was stirred at rt for 2 h. Dowex 50H⁺ cation exchange resin was added until neutral pH, the resin was filtered off and the filtrate was concentrated. A solution of the residue in MeOH (5 mL) was stirred at rt with 10% Pd-C (50 mg) under hydrogen at atmospheric pressure. The catalyst was filtered over Celite and the filtrate was concentrated. Chromatography (10:1 CH₂Cl₂/MeOH) of the residue on a column of silica gel afforded 16 as a colorless crystalline solid. Yield: 80 mg (70%). 4.1.29. X-ray structure determination of compounds **5**, $7 \cdot H_2$ O, **17**, **20**, **27**, and **33**. X-ray data were collected on a Bruker Smart APEX CCD area detector diffractometer using graphite-monochromated Mo K α radiation (λ =0.71073 Å) and 0.3° ω -scan frames. Corrections for absorption (multi-scan method) and λ /2 effects were applied.³⁰ After structure solution with program SHELXS97 and direct methods, refinement on F^2 was carried out with the program SHELXL97.³¹ Nonhydrogen atoms were refined anisotropically. All H-atoms were placed in calculated positions and thereafter treated as riding. Except for **5**, the absolute structures could be unambiguously determined by anomalous dispersion effects and the Flack absolute structure parameter (*FASP*). Important crystallographic data are given below, crystallographic data for structures **5**, 7 · H₂O, 17, 20, 27, and 33 have been deposited with the Cambridge Crystallographic Data Centre as supplementary publications CCDC 759592–759597.

Compound **5**: $C_{43}H_{54}O_4$, M_r =634.86, colorless block from EtOAc/ hexane, $0.50 \times 0.45 \times 0.40$ mm, monoclinic, space group P_{21} (no. 4), a=7.6234(8) Å, b=33.691(4) Å, c=13.9033(15) Å, β =90.309(2)°, V=3570.8(7) Å³, Z=4, μ =0.074 mm⁻¹, d_x =1.181 g cm⁻³, T=100 K. 36,626 reflections collected (θ_{max} =30.0°) and merged to 20,209 independent data (R_{int} =0.028); final R indices (all data): R_1 =0.0570, wR_2 =0.1110, 862 parameters, *FASP*=0.5(9). The structure contains two independent molecules and is pseudosymmetric.

Compound **7**·H₂O: C₄₅H₅₇IO₅·H₂O, M_r =822.82, colorless prism from wet EtOAc/hexane, 0.60×0.19×0.08 mm, orthorhombic, space group *P*2₁2₁2₁ (no. 19), *a*=9.6240(4) Å, *b*=13.4522(6) Å, *c*=30.5377 (14) Å, *V*=3953.5(3) Å³, *Z*=4, μ =0.858 mm⁻¹, *d*_{*X*}=1.382 g cm⁻³, *T*=100 K. 43,594 reflections collected (θ_{max} =30.0°) and merged to 11,452 independent data (*R*_{int}=0.021); final *R* indices (all data): *R*₁=0.0235, *wR*₂=0.0534, 480 parameters, *FASP*=-0.019(7). The compound contains a water molecule, which is hydrogen bonded to the carbonyl oxygen atoms of the two COOR groups (0···O=2.89 and 2.97 Å). *Compound* **17**: C₄₃H₅₄O₃S, M_r =714.45, colorless prism from ethanol, 0.59×0.44×0.42 mm, orthorhombic, space group *P*2₁2₁2₁ (no. 19), *a*=10.6918(6) Å, *b*=17.5747(9) Å, *c*=18.7998(10) Å, *V*=3532.6 (3) Å³, *Z*=4, μ =0.131 mm⁻¹, *d_x*=1.224 g cm⁻³, *T*=100 K. 52,033 reflections collected (θ_{max} =30.0°) and merged to 10,266 independent data (R_{int} =0.032); final *R* indices (all data): R_1 =0.0448, wR_2 =0.1018, 431 parameters, *FASP*=-0.07(4).

Compound **20**: C₄₇H₆₀O₆S, *M*_r=753.01, colorless block from CH₂Cl₂/hexane, 0.48×0.37×0.25 mm, monoclinic, space group *P*2₁ (no. 4), *a*=11.9330(5) Å, *b*=16.2826(6) Å, *c*=11.9601(5) Å, *β*=116.530 (1)°, *V*=2079.15(14) Å³, *Z*=2, μ =0.126 mm⁻¹, *d*_{*x*}=1.203 g cm⁻³, *T*=100 K. 27,869 reflections collected (θ_{max} =30.0°) and merged to 11,412 independent data (*R*_{int}=0.019); final *R* indices (all data): *R*₁=0.0346, *wR*₂=0.0875, 496 parameters, *FASP*=-0.01(3).

Compound **27**: $C_{32}H_{47}BrO_4S$, M_r =607.67, colorless blade from EtOAc/hexane, $0.58 \times 0.34 \times 0.02$ mm, monoclinic, space group $P2_1$ (no. 4), a=7.9488(13) Å, b=11.3585(19) Å, c=16.754(3) Å, β =90.216 (3)°, V=1512.7(4) Å³, Z=2, μ =1.462 mm⁻¹, d_x =1.334 g cm⁻³, T=297 K. 6109 reflections collected (θ_{max} =28.3°) and merged to 4109 independent data (R_{int} =0.052); final R indices (all data): R_1 =0.0695, wR_2 =0.0865, 354 parameters, *FASP*=0.001(10).

Compound **33**: C₄₃H₅₄O₃S, *Mr*=650.92, colorless prism from EtOAc/hexane, $0.58 \times 0.20 \times 0.20$ mm, monoclinic, space group *P*2₁ (no. 4), *a*=7.6070(4) Å, *b*=14.2467(7) Å, *c*=16.6541(8) Å, *β*=90.275 (1)°, *V*=1804.86(16) Å³, *Z*=2, μ =0.128 mm⁻¹, *d*_x=1.198 g cm⁻³, *T*=100 K. 18,728 reflections collected (θ_{max} =30.0°) and merged to 10,296 independent data (*R*_{int}=0.014); final *R* indices (all data): *R*₁=0.0317, *wR*₂=0.0812, 435 parameters, *FASP*=0.03(3).
