The attempted ethenylation at C(2) of 2-unsubstituted 1*H*-imidazole *N*-oxides with ethyl acrylate (= prop-2-enoate) in the presence of Pd(OAc)₂ does not occur. In contrast to the other aromatic *N*-oxides, the [2 + 3] cycloaddition of imidazole *N*-oxides predominates, and 3-hydroxyacrylates, isomeric with the cycloadducts, are key products for the subsequent reaction. The final products were identified as dehydrated 2 + 1 adducts of 1*H*-imidazole *N*-oxide and ethyl acrylate. The role of the catalyst is limited to the dehydration of the intermediate 3-hydroxypropanoates to give 1*H*-imidazol-2-yl-substituted acrylates.

1. Introduction. – In recent years, several reports on the synthesis and applications of 2-unsubstituted imidazole 3-oxides **1** were published. In contrast to six-membered aromatic heterocyclic *N*-oxides, they cannot be prepared by direct oxidation of the parent system, but the condensation of α -hydroxyimino ketones with methyldiene amines offers a convenient access to this group of reactive 1*H*-imidazole derivatives [1][2]. One of the most characteristic features of their structure is the ‘nitron-like’ pattern, which enables diverse 1,3-dipolar cycloadditions with electron-deficient acetylenes and ethenes, as well as isocyanates and thiocarbonyl compounds [2][3]. The initially formed [2 + 3] cycloadducts have never been isolated, and secondary processes occur leading to the products depicted in *Scheme 1*.

On the other hand, **1** can easily be arylated at C(2) in the presence of Pd(OAc)₂ with preservation of the *N*-oxide function [4]. The conversion of *N*-oxides **1** to the corresponding imidazoles occurs smoothly upon treatment with *Raney*-Ni at room temperature [5].

The metal-catalyzed formation of new C,C bonds in aromatic and heteroaromatic rings is a challenging task in modern organic synthesis, and the state of the art in the field of imidazole derivatives has recently been reviewed [6]. A frequently studied reaction is the ethenylation with acrylates leading to 3-arylprop-2-enoates. Despite the potential importance of ethenylations of aromatic *N*-oxides, there are, to the best of our knowledge, only two reports on Pd-catalyzed reactions of this type (*Scheme 2*). In one case, pyridine 1-oxides **2** were converted regioselectively into 3-(pyridin-2-yl)prop-2-enoates **3** with a preserved *N*-oxide group in high yields [7]. The second reaction

¹⁾ Master thesis of A. W., University of Łódź, 2011.

Scheme 1

reported is the transformation of quinoline *N*-oxides **4** to the prop-2-enoates **5**. In these reactions, a spontaneous deoxygenation of the *N*-oxide occurred [8].

Scheme 2

In a recent report, the synthesis of 2-hydroxy-3-(isoquinolin-1-yl)propanoates **6**, via the *in situ* generated isoquinoline *N*-oxide and acrylates (= prop-2-enoates) in the presence of LiOH as a base, was described [9] (Scheme 3). It is worth mentioning that this reaction proceeds without transition metal catalysis.

Scheme 3

Thermal [2 + 3] cycloadditions of acrylates with aromatic *N*-oxides, which, in general, are recognized as poor 1,3-dipoles, are almost unknown. Huisgen *et al.* have shown that phenanthridine *N*-oxide and ethyl acrylate react in DMF solution at 75° to give products of type **6** [10]. The formation of the latter has been rationalized by a [2 + 3] cycloaddition, followed by a spontaneous ring opening of the intermediate isoxazolidine. In addition, the reaction of quinoline *N*-oxide with 2-methylacrylonitrile to produce an analogous product identified as 2-hydroxy-2-methyl-3-(quinolin-2-yl)propanenitrile has been reported [11].

Prompted by the results described in [7] and [8], we decided to study the reaction of ethyl acrylate with 2-unsubstituted 1*H*-imidazole 3-oxides **1** both in the presence and in the absence of a catalytic amount of Pd(AcO)₂.

Results and Discussion. – In a preliminary experiment, equimolar amounts of ethyl acrylate and 1-methyl-4,5-diphenyl-1*H*-imidazole 3-oxide (**1a**) were dissolved in CHCl₃. No reaction took place at room temperature nor when the solution was heated to reflux. Therefore, the starting **1a** and a fivefold excess of acrylate were dissolved in *N*-methylpyrrolidone (NMP; 1-methylpyrrolidin-2-one), and the solution was heated in an oil bath (110°). After *ca.* 1 h, the reaction was stopped, and chromatographic workup led to an oily product. The spectroscopic data provided the structure of the 3-hydroxypropanoate **7a** (Scheme 4). Analogous products **7b–7d** were obtained with 1-ethyl-, 1-propyl-, and 1-allyl-4,5-diphenyl-1*H*-imidazole 3-oxides, respectively, in 26–33% yield. Attempted reactions with the corresponding 4,5-dimethyl- or 4-methyl-5-phenyl-1*H*-imidazole 3-oxides led to complex mixtures of products.

Scheme 4

The formation of the β -hydroxy esters **7** can be explained by an initial [2 + 3] cycloaddition to give **8** and subsequent opening of the isoxazolidine ring *via* cleavage of the N–O bond, and aromatization of the imidazole unit.

To achieve the ethenylation product of **1a**, a similar experiment with ethyl acrylate was carried out in the presence of 5 mol% of Pd(OAc)₂. After *ca.* 1 h, an analogous result was obtained as in the absence of the catalyst. When the reaction time was extended to 2.5 h, no **7a** was present in the mixture. Chromatographic workup afforded a crystalline material, which showed signals of two MeN and only one EtO group in the ¹H-NMR spectrum. These data suggested that the new product contains two imidazole and one propanoate moieties. The HR-MS exhibited the [M + 1]⁺ peak at *m/z* 583.2700, which corresponds to a structure formed from two molecules **1a** and one

molecule of ethyl acrylate after elimination of H_2O . Finally, an X-ray crystal-structure determination unambiguously disclosed the molecular structure of product **9a**, which formally corresponds to a *Michael* adduct of 1-methyl-4,5-diphenyl-1*H*-imidazol-2-one (**10a**) with 2-(1*H*-imidazol-2-yl)acrylate **11a** (Scheme 5 and Fig.). Most likely, the latter compound is formed *in situ* by dehydration of **7a**. The imidazol-2-one **10a** can be

Figure. ORTEP Plot [13] of the molecular structure of **9a** (with 50% probability ellipsoids; arbitrary atom numbering)

formed *in situ* via thermal isomerization of **1a** [12]. The analogous reaction course leading to products **9** was established starting with **1b**–**1d**.

To obtain additional support for the proposed reaction mechanism, three control experiments were carried out. First, the isolated hydroxy ester **7b** was dehydrated in NMP solution at 110° in the absence, as well as in the presence, of catalytic amounts of Pd(OAc)₂. After 1 h, the progress of the reaction in both cases was examined by ¹H-NMR spectroscopy. Whereas the reaction performed in the presence of Pd(OAc)₂ was complete, yielding **11b** exclusively, the reaction without Pd(OAc)₂ gave **11b** only in traces, and more than 90% of **7b** were still present in the mixture. Second, a mixture of the isolated **11b** and imidazol-2-one **10b** (R = Et) were heated in NMP in the presence of catalytic amounts of Pd(OAc)₂. After 2 h, the ¹H-NMR spectrum of the mixture indicated the presence of unchanged substrates, and no **9b** could be detected. In the third experiment, equimolar amounts of **11b** and **1a** (R = Me) were heated in NMP solution at 110° in the absence of Pd(OAc)₂. After 1 h, the mixture was analyzed by ¹H-NMR spectroscopy. However, also in this case, no traces of the expected ‘mixed product’ of type **9** were found in the mixture.

These results show that the formation of products **9** does not result from the reaction of **11** either with isolated imidazol-2-ones **10** or with *N*-oxides **1**. Therefore, formulation of a convincing mechanism of a cascade reaction leading to the *Michael* adducts of type **9** is not possible at the moment.

3. Conclusions. – The present study showed that 2-unsubstituted 1*H*-imidazole 3-oxides, in contrast to quinoline and pyridine *N*-oxides, do not undergo the ethenylation reaction with ethyl acrylate in the presence of Pd(OAc)₂. The results indicate that, under the applied conditions, the preferred reaction is the [2 + 3] cycloaddition, which occurs regioselectively, leading to 3-hydroxypropanoate, which is a product of the spontaneous ring opening of the five-membered cycloadduct. It is worth mentioning that the structures of the isolated hydroxy esters **7** do not correspond to those of the products of analogous reactions with isoquinoline and quinoline *N*-oxides, respectively [9–11]. The catalyst used in the reaction accelerates the dehydration of the hydroxy ester, formed after ring opening of the initial isoxazolidine derivative.

The authors thank PD Dr. L. Bigler (University of Zurich) for recording HR-MS and Mrs. Małgorzata Celeda (University of Łódź) for her skillful help in the preparation of starting 1*H*-imidazole 3-oxides.

Experimental Part

1. *General.* M.p.: MEL-TEMP II (Aldrich); uncorrected. IR Spectra: NEXUS FT-IR instrument; in KBr or as film; absorptions in cm^{−1}. ¹H- and ¹³C-NMR spectra: BRUKER AVANCE III instrument (¹H at 600 and ¹³C at 150 MHz) using solvent signal as reference; in CDCl₃; chemical shifts (δ) in ppm; coupling constants *J* in Hz. The majority of the ¹³C signals were assigned with the aid of DEPT spectra. ESI-HR-MS: Finnigan MAT-95 spectrometer.

2. *Starting Materials.* The used reagents and solvents such as ethyl acrylate, Pd(OAc)₂, *N*-methylpyrrolidone (NMP; 1-methylpyrrolidin-2-one), petroleum ether (PE), Et₂O, diisopropyl ether (ⁱPr₂O), pentane, and AcOEt are commercially available. 1*H*-Imidazole 3-oxides **1** were prepared according to known protocols [2].

3. *Reactions of 2-Unsubstituted 1H-Imidazole 3-Oxides with Ethyl Acrylate.* A mixture of the corresponding oxide **1** (1 mmol), ethyl acrylate (5 mmol), Pd(OAc)₂ (5 mol%), and NMP (1 ml; used as

a solvent) was heated under Ar in an oil bath at 110° for 40–45 min. After evaporation of the solvent and excess ethyl acrylate by vacuum distillation (bulb-to-bulb), the residues were separated on prep. TLC plates (SiO₂; hexane or PE/AcOEt 1:1) to give products **7** as pale yellow oils. Analogous results were obtained when the reactions were carried out without the addition of catalytic amounts of Pd(OAc)₂.

When the reactions were carried out for 2–2.5 h, no 3-hydroxypropanoates **7** were detected in the crude mixtures. Separation by prep. TLC gave solid materials identified as products **9**, which subsequently were purified by crystallization from mixtures of PE or pentane with small amounts of Et₂O or ⁱPr₂O.

Ethyl 3-Hydroxy-2-(1-methyl-4,5-diphenyl-1H-imidazol-2-yl)propanoate (7a). Yield: 98 mg (28%). Pale-yellow oil. IR (film): 3355 (OH), 3062, 2981, 2959, 2934, 2248, 1733 (C=O), 1603, 1507, 1465, 1443, 1301, 1243, 1185, 1072, 1055, 1044, 910, 732, 700, 648. ¹H-NMR (CDCl₃): 1.34 (t, *J* = 7.1, MeCH₂O); 3.35 (s, MeN); 3.92 (t, *J* = 4.0, HOCH₂CH); 4.25–4.35 (m, MeCH₂O); 4.46 (d, *J* = 4.0, HOCH₂CH); 5.16 (br. s, OH); 7.14–7.52 (m, 10 arom. H). ¹³C-NMR (CDCl₃): 14.2 (MeCH₂O); 31.0 (MeN); 45.9 (HOCH₂CH); 61.7, 63.5 (2 CH₂O); 126.4, 126.6, 128.1, 128.8, 129.1, 130.9 (10 arom. CH); 129.4, 130.8, 134.2, 136.3 (2 arom. C, C(4), C(5)); 143.9 (C(2)); 169.8 (C=O). HR-ESI-MS: 351.1730 ([*M* + H]⁺, C₂₁H₂₃N₂O₃⁺; calc. 351.1703).

Ethyl 2-(1-Ethyl-4,5-diphenyl-1H-imidazol-2-yl)-3-hydroxypropanoate (7b). Yield: 120 mg (33%). Pale-yellow oil. IR (film): 3355 (OH), 3057, 2982, 2937, 2875, 2305, 1736 (C=O), 1603, 1507, 1473, 1446, 1327, 1266, 1181, 1072, 1045, 1029, 955, 738, 774, 700. ¹H-NMR (CDCl₃): 1.14 (t, *J* = 7.2, MeCH₂N); 1.34 (t, *J* = 7.0, MeCH₂O); 3.77–3.84 (m, MeCH₂N); 3.92 (t, *J* = 4.0, HOCH₂CH); 4.21–4.34 (m, MeCH₂O); 4.42 (d, *J* = 4.0, HOCH₂CH); 5.22 (br. s, OH); 7.14–7.52 (m, 10 arom. H). ¹³C-NMR (CDCl₃): 14.2 (MeCH₂O); 15.9 (MeCH₂N); 38.7 (MeCH₂N); 45.8 (HOCH₂CH); 61.7, 62.9 (2 CH₂); 126.3, 126.5, 128.0, 128.9, 129.1, 131.1 (10 arom. CH); 128.6, 131.2, 134.2, 136.6 (2 arom. C, C(4), C(5)); 143.2 (C(2)); 170.1 (C=O). HR-ESI-MS: 365.1870 ([*M* + H]⁺, C₂₂H₂₅N₂O₃⁺; calc. 365.1860).

Ethyl 2-(4,5-Diphenyl-1-propyl-1H-imidazol-2-yl)-3-hydroxypropanoate (7c). Yield: 110 mg (29%). Pale-yellow oil. IR (film): 3351 (OH), 3060, 2970, 2935, 2876, 1736 (C=O), 1603, 1507, 1470, 1445, 1369, 1239, 1179, 1073, 1046, 1028, 968, 775, 699. ¹H-NMR (CDCl₃): 0.78 (t, *J* = 7.4, MeCH₂CH₂N); 1.34 (t, *J* = 7.1, MeCH₂O); 1.47–1.54 (m, MeCH₂CH₂N); 3.68–3.71 (m, CH₂N); 3.93 (t, *J* = 4.2, HOCH₂CH); 4.27–4.32 (m, MeCH₂O); 4.43 (d, *J* = 4.2, HOCH₂CH); 5.18 (br. s, OH); 7.13–7.51 (m, 10 arom. CH). ¹³C-NMR (CDCl₃): 11.0 (MeCH₂CH₂N); 14.2 (MeCH₂O); 23.8 (MeCH₂CH₂N); 45.5 (CH₂N); 45.9 (HOCH₂CH); 61.5, 62.9 (2 CH₂); 126.3, 126.5, 128.0, 128.8, 129.1, 131.1 (10 arom. CH). ¹³C-NMR (CDCl_3): 11.0 (2 $\text{MeCH}_2\text{CH}_2\text{N}$); 14.0 (MeCH_2); 22.5, 24.0 (2 $\text{MeCH}_2\text{CH}_2\text{N}$); 41.6 (CH_2CH); 43.2, 43.3 (2 $\text{MeCH}_2\text{CH}_2\text{N}$); 45.3 (CH_2N); 61.3 (MeCH_2); 125.9, 126.8, 127.7, 127.8, 127.9, 128.3, 128.4, 128.5, 128.9, 130.3, 130.6, 131.0 (20 arom. CH); 121.2, 121.8, 128.7, 129.4, 131.8, 134.7, 137.2, 142.4 (4 arom. C, 2 C(4), 2 C(5), C(2)); 153.6, 169.6 (2 C=O). HR-ESI-MS: 639.3333 ($[M + H]^+$, $\text{C}_{41}\text{H}_{43}\text{N}_4\text{O}_3^+$; calc. 639.3329).

Ethyl 3-[2,3-Dihydro-2-oxo-4,5-diphenyl-3-(prop-2-en-1-yl)-1H-imidazol-1-yl]-2-[4,5-diphenyl-1-(prop-2-en-1-yl)-1H-imidazol-2-yl]propanoate (9d). Yield: 65 mg (21%). Pale-yellow crystals. M.p. 132–134° (pentane/Et₂O). IR (KBr): 3439, 3061, 3025, 2980, 2923, 1734 (C=O), 1694 (C=O), 1602, 1505, 1445, 1396, 1351, 1256, 1228, 1194, 1161, 1098, 1071, 1028, 944, 923, 866, 777, 702, 667, 650, 615, 543, 502. ¹H-NMR (CDCl_3): 1.20 (t, $J = 7.1$, MeCH_2O); 4.05–4.10 (m, 1 H of MeCH_2O); 4.15–4.20 (m, 1 H of MeCH_2O); 4.20–4.30 (m, $\text{NCH}_2\text{CH}=\text{CH}$); 4.35–4.48 (m, $\text{NCH}_2\text{CH}=\text{CH}$); 4.43 (dd, $J = 14.0$, 7.5, 1 H of CH_2N); 4.62 (dd, $J = 14.0$, 7.0, 1 H of CH_2N); 4.81–4.85 (m, $\text{CH}_2=\text{CH}$); 4.97 (dd, $J = 10.0$, 0.7, 1 H of $\text{CH}_2=\text{CH}$); 5.06 (dd, $J = 10.0$, 0.7, 1 H of $\text{CH}_2=\text{CH}$); 5.09 (t, $J = 7.0$, CH_2CH); 5.73–5.83 (m, 2 $\text{CH}_2=\text{CH}$); 7.08–7.45 (m, 20 arom. CH). ¹³C-NMR (CDCl_3): 14.0 (MeCH_2); 41.8 (CH_2CH); 43.1, 43.9, 45.8 (3 CH_2N); 61.3 (CH_2O); 116.6, 116.8 (2 $\text{CH}_2=\text{CH}$); 126.0, 126.8, 127.9, 128.01, 128.02, 128.3, 128.4, 128.7, 128.8, 130.4, 130.6, 131.1, 133.3, 133.4 (2 $\text{CH}_2=\text{CH}$, 20 arom. CH); 121.3, 121.8, 128.1, 128.5, 129.0, 129.04, 129.1, 131.3 (4 arom. C, 2 C(4), 2 C(5), C(2)); 153.4, 169.5 (2 C=O). HR-ESI-MS: 635.3011 ($[M + H]^+$, $\text{C}_{41}\text{H}_{39}\text{N}_4\text{O}_3^+$; calc. 635.3016).

4. Dehydration of 3-Hydroxypropanoate **7b**. Experiment A (in the presence of $\text{Pd}(\text{OAc})_2$). A soln. of **7b** (1 mmol) in NMP (1 ml) was heated in an oil bath at 110° for 1 h in the presence of a cat. amount (ca. 15 mg) of $\text{Pd}(\text{OAc})_2$. Then, the solvent was evaporated by vacuum distillation, and the crude mixture was separated by prep. TLC (SiO_2 ; PE/AcOEt 3 : 2) to give *ethyl 2-(1-ethyl-4,5-diphenylimidazol-2-yl)prop-2-enoate (11b)* as a semi-solid material. This quite unstable compound was used for further experiments with no additional purification. Yield after chromatographic workup: 240 mg (68%). IR (KBr): 3058, 2963, 2932, 2872, 1734, 1602, 1506, 1261, 1096, 1024, 803, 773, 696. ¹H-NMR (CDCl_3): 1.06 (t, $J = 7.2$, MeCH_2N); 1.36 (t, $J = 7.1$, MeCH_2O); 3.80 (q, $J = 7.2$, MeCH_2N); 4.34 (q, $J = 7.1$, MeCH_2O); 6.36, 6.79 (2d, $J = 1.4$, $=\text{CH}_2$); 7.14–7.49 (m, 10 arom. CH). ¹³C-NMR (CDCl_3): 14.2, 19.9 (2 MeCH_2); 39.6 (CH_2N); 61.5 (CH_2O); 126.2, 126.8, 128.0, 128.7 129.0, 131.0 (10 arom. CH); 133.9 (C= CH_2); 129.4, 131.3, 132.9, 134.5, 137.7, 142.9 (2 arom. C, C(2), C(4), C(5), C= CH_2); 165.3 (C=O). ESI-MS (MeCN): 369 (20, $[M + \text{Na}]^+$), 347 (100, $[M + 1]^+$). HR-EI-MS (70 eV): 346.1681 (M^+ , $\text{C}_{22}\text{H}_{22}\text{N}_2\text{O}_2^+$; calc. 346.1687).

Experiment B (in the absence of $\text{Pd}(\text{OAc})_2$). A soln. of **7b** (1 mmol) in NMP (1 ml) was heated in an oil bath at 110° for 1 h. Then, the solvent was evaporated by vacuum distillation, and the crude, oily mixture was analyzed by ¹H-NMR spectroscopy. In this case, **7b** was still the main component of the crude mixture.

5. *X-Ray Crystal-Structure Determination of 9a* (Table and Fig.)²⁾. All measurements were conducted on an *Agilent Technologies SuperNova* area-detector diffractometer [14], with MoK_α radiation ($\lambda = 0.71073 \text{ \AA}$) from a micro-focus X-ray source, and an *Oxford Instruments Cryojet XL* cooler. Data reduction was performed with *CrysAlisPro* [14]. The intensities were corrected for *Lorentz* and polarization effects, and an empirical absorption correction using spherical harmonics [14] was applied. The space group was uniquely determined by the systematic absences. Equivalent reflections were merged. The data collection and refinement parameters are compiled in the Table. A view of the molecule is shown in the Figure. The structure was solved by direct methods using *SHELXS97* [15], which revealed the positions of all non-H-atoms. The non-H-atoms were refined anisotropically. All of the H-atoms were placed in geometrically calculated positions and refined by using a riding model where

Table. Crystallographic Data for Compound **9a**

Crystallized from	$\text{CH}_2\text{Cl}_2/\text{PrO}_2$
Empirical formula	$\text{C}_{37}\text{H}_{34}\text{N}_4\text{O}_3$
Formula weight [g mol^{-1}]	582.70
Crystal color, habit	colorless, prism
Crystal dimensions [mm]	$0.08 \times 0.20 \times 0.40$
Temp. [K]	160(1)
Crystal system	monoclinic
Space group	$P2_1/c$
Z	4
Reflections for cell determination	9701
2θ Range for cell determination [$^\circ$]	4–59
Unit cell parameters	$a [\text{\AA}]$
	15.5476(6)
	$b [\text{\AA}]$
	10.0461(3)
	$c [\text{\AA}]$
	19.8750(7)
	$\beta [^\circ]$
	95.067(3)
	$V [\text{\AA}^3]$
	3092.20(19)
$D_x [\text{g cm}^{-3}]$	1.252
$\mu(\text{MoK}_\alpha) [\text{mm}^{-1}]$	0.0805
Scan type	ω
$2\theta_{(\text{max})} [^\circ]$	59.1
Transmission factors (min; max)	0.731; 1.000
Total reflections measured	28418
Symmetry independent reflections	7690
Reflections with $I > 2\sigma(I)$	5820
Reflections used in refinement	7690
Parameters refined	401
Final $R(F)$ [$I > 2\sigma(I)$ reflections]	0.0447
$wR(F^2)$ (all data)	0.1160
Weights	$w = [\sigma^2(F_o^2) + (0.0484P)^2 + 0.9470P]^{-1}$ where $P = (F_o^2 + 2F_c^2)/3$
Goodness of fit	1.030
Secondary extinction coefficient	0.0026(5)
Final $\Delta_{\text{max}}/\sigma$	0.001
$\Delta\rho$ (max; min) [$\text{e \AA}^{-3}$]	0.30; – 0.20

²⁾ CCDC-859644 contains the supplementary crystallographic data for this contribution. These data can be obtained free of charge from the *Cambridge Crystallographic Data Centre*, via www.ccdc.cam.ac.uk/data_request/cif.

each H-atom was assigned a fixed isotropic displacement parameter with a value equal to $1.2 U_{\text{eq}}$ of its parent C-atom ($1.5 U_{\text{eq}}$ for the Me groups). The refinement of the structure was carried out on F^2 by using full-matrix least-squares procedures, which minimized the function $\sum w(F_o^2 - F_c^2)^2$. A correction for secondary extinction was applied. Neutral-atom scattering factors for non-H-atoms were taken from [16a], and the scattering factors for H-atoms were taken from [17]. Anomalous dispersion effects were included in F_c [18]; the values for f' and f'' were those of [16b]. The values of the mass attenuation coefficients are those of [16c]. The SHELXL97 program [15] was used for all calculations.
