Low-Valent Nickel and Palladium Complexes with 1,1'-Bis(phosphanyl)ferrocenes: Syntheses and Structures of Acrylic Acid and Ethylene Complexes

Jens Langer,^[a] Reinald Fischer,^[a] Helmar Görls,^[a] and Dirk Walther*^[a]

Keywords: Alkene ligands / Chelates / Nickel / Palladium / P ligands

Thermally stable acrylic acid complexes with low-valent nickel or palladium of the type $[(L)M(\eta^2-CH_2=CH-COOH)]$ [1a: M = Ni, L = 1,1'-bis(diphenylphosphanyl)ferrocene (dppf), 1b: M = Ni, L = 1,1'-bis(diisopropylphosphanyl)ferrocene (dippf), 1c: M = Pd, L = dippf] were obtained by reaction of $[Ni(cod)_2]$ or [(L)Pd(nb)] with acrylic acid in the presence of the phosphane ligands. X-ray diffraction analysis of 1a and 1c, respectively display that only the olefin part is coordinated. Hydrogen bonds between two carboxyl groups result in dimers in the solid state. The isomeric nickela-cyclic carboxylates of the type $[(L)Ni(CH_2CH_2COO)]$ are stable com-

plexes in case of 2a (L = dppf) and 2b (L = dippf) whereas the unstable compound 2c [L = 1,1'-bis(di-*tert*-butylphosphanyl)-ferrocene (dtbpf)] undergoes fast reductive decoupling to form CO₂ and the ethylene complex [(dtbpf)Ni(ethylene)] (3c). The related complex [(dippf)Ni(ethylene)] (3b) was prepared from nickel(0) complexes by ligand exchange reaction. 3b and 3c were characterized by elemental analyses, NMR spectroscopy and X-ray structure analysis of single crystals.

Introduction

Recently we have described some model complexes of the hypothetical catalytic reactions between ethylene and CO₂ to form acrylic acid or its derivatives.^[1] In connection with these investigations we have also tried to synthesize the hitherto unknown nickel(0) complexes with η^2 -coordinated acrylic acid which are assumed to be model compounds of the final intermediate of the catalytic cycle. However, such complexes could not be obtained with N-donor ligands or phosphanes of the type R₂P(CH₂)_nPR₂.

In this paper we report that some 1,1'-bis(phosphanyl)ferrocenes (L) are able to form surprisingly stable complexes of the type [(L)M(η^2 -acrylic acid)]. Furthermore, we have isolated the isomeric form of [(dippf)Ni(acrylic acid)], the metallacycle [(dippf)Ni(CH₂CH₂COO)], and we also succeeded in obtaining ethylene nickel(0) complexes with bis(phosphanyl)ferrocene ligands which are also hitherto unknown. These three types of complexes may also be considered as model compounds for intermediates of the metalmediated reaction between ethylene and CO₂ to form acrylic acid.

Generally, the low-valent nickel chemistry with 1,1'-bis-(phosphanyl)ferrocene ligands L is rather limited. To the best of our knowledge the only isolated nickel(0) compounds are some carbonyl complexes^[2,3] and [(dppf)-Ni(cod)].^[4] The compound [(dppf)₂Ni] was only prepared in

$$R = t \operatorname{Bu} (\mathbf{3c})$$
$$R = t \operatorname{Bu} (\mathbf{3c})$$

situ.^[5,6] This is somewhat surprising since low-valent nickel complexes with 1,1'-bis(phosphanyl)ferrocene ligands are known to be intermediates in numerous homogeneous catalytic reactions.^[7–13] In addition, they may serve as precursors for new catalysts and for the study, in a stoichiometric manner, of key steps in the catalytic reactions.

Results and Discussion

Nickel(0) and Palladium(0) Complexes with Acrylic Acid

The acrylic acid complexes 1a and 1b were obtained by reacting a mixture of [Ni(cod)₂], dppf or dippf and acrylic acid in a solution of THF at 0 °C according to Scheme 1.

Scheme 1. Formation of nickel complexes with acrylic acid.

1a was isolated in good yields (71%) as red crystalline compound. NMR spectroscopic data showed that both phosphorus donor atoms coordinate to the nickel in a different chemical environment (${}^{31}P{}^{1}H{}$ NMR ([D₈]THF): 26.7 and 32.6 ppm). In the ¹H NMR spectrum ($[D_8]THF$) the proton signals of the olefinic CH₂ group appeared at δ = 1.95 and 2.25 ppm and the resonance of the olefinic CH group was found at $\delta = 2.98$ ppm. A broad signal for the COOH proton appeared at $\delta = 9.64$ ppm. Furthermore, six different signals of the cp groups integrating together to eight protons were observed, and the 20 protons of phenyl groups appeared between 7.28 and 7.80 ppm. The ¹³C NMR spectrum also confirmed the olefin-like coordination of the acrylic acid with the two signals for the olefinic carbons at δ = 43.9 and 49.8 ppm and the signal of the COOH group at $\delta = 175.9$ ppm.

Single crystals of **1a** were grown from a solution of THF and an X-ray diffraction analysis (Figure 1) showed the nickel atom, surrounded by two phosphorus atoms and the two carbon atoms C1 and C2 of the alkene group. Since the angle between the P1,P2,Ni plane and the C1,C2,Ni plane is only 6.24° , the coordination geometry around the metal centre can be considered as essentially planar. The COOH group is not coordinated. Complex **1a** forms a dimer in the solid state since two carboxylic groups are connected by the typical hydrogen bond pattern of carboxylic acids. As expected, the bond length between C1 and C2 of the olefin group [1.417(4) Å] is slightly enlarged compared with the uncoordinated state of acrylic acid. Other relevant bond lengths and angles (see caption of Figure 1) are within the normal range and need therefore no further discussion.

The reaction between $[Ni(cod)_2]$, dippf und acrylic acid in THF resulted in a mixture of the acrylic acid complex **1b** as main product and traces of a second compound, suspected to be the isomeric nickela-cyclic carboxylate [(dippf)-Ni(CH₂CH₂COO)] (**2b**, see below) according to the signals in the ³¹P NMR spectrum of the mother liquor.

The pure complex **1b** was isolated upon crystallisation from a solution of THF or DMF in good yields. ¹H NMR spectroscopy of **1b** revealed that the compound has a similar structure as found for **1a**: The proton signals of the coordinated CH₂=CH- group at 2.57 and 2.88 are only slightly downfield shifted compared with those of **1a**, and

Figure 1. Molecular structure of **1a** (H atoms except the one at O2 are omitted for clarity, cocrystallized THF not shown). Selected bond lengths [Å] and angles [°]: Ni–C1 1.945(2), Ni–C2 1.993(3), Ni–P1 2.1781(7), Ni–P2 2.1411(8), C1–C2 1.417(4), C2–C3 1.446(4), C3–O1 1.275(4), C3–O2 1.291(4), P1–Ni–P2 109.71(3), P1–Ni–C2 111.55(9), P2–Ni–C1 109.71(3), C1–Ni–C2 42.2(1), plane(P1,P2,Ni)-plane(Ni,C1,C2) 6.24.

the resonance of the COOH proton appeared at $\delta = 10.35$ ppm. The ¹³C resonances of **1b** for the olefin group were found at 32.7 (=CH₂) and 42.7 (=CH) ppm and the signal of the COOH group was observed at $\delta = 177.7$ ppm confirming the olefin-like coordination of the acrylic acid ligand as well. In addition, X-ray structure of single crystals (not depicted) showed that **1b** has essentially the same solidstate structure as **1a** with the η^2 coordination of the acrylic acid ligand and hydrogen bonds between two acrylic acid ligands resulting in a dimer.

Reaction between acrylic acid and nickel(0) complexes in the presence of Cy_3P was already investigated by Yamamoto et al.^[14] In this case, however, no stable nickel(0) complex of acrylic acid was formed, instead the interconversion into the isomeric nickela-cyclic carboxylate [(Cy_3P)-Ni(CH_2CH_2COO)]_n was observed. This clearly demonstrates the strong influence of the supporting ligands on the following equilibrium (Scheme 2).

Scheme 2. Equilibrium between $L_nNi(CH_2=CH-COOH))$ and $[(Ln)Ni(CH_2CH_2COO)]$.

1a is surprisingly thermally stable in THF as well in the solid state. Even heating the complex for 3 h in refluxing THF did not result in any reaction. This demonstrates that the isomerization into the nickela-cyclic carboxylate (see Scheme 2) is in this case an energetically unfavourable pathway.

So far, only the metal(0) acrylic acid complex [(acrylic acid)Fe(CO)₄] was described.^[15] Furthermore, the dimeric Cu^I compound [ClCu(acrylic acid)]₂ with η^2 coordinated acrylic acid has been prepared.^[16] In addition, Carmona has found that acrylate hydrido molybdenum(II) and tungsten(II) complexes were formed by reaction of ethylene and CO₂ at an electron-rich Mo(0) or W⁰ fragment.^[17] In contrast, acrylic ester complexes with Ni⁰ or Pd⁰ have been

found to be stable^[18,19] due to the lack of the reactive COOH group.

To demonstrate that the ability of 1,1'-bis(phosphanyl)ferrocene ligands in stabilizing acrylic acid complexes is not restricted to nickel(0) we also prepared the related Pd⁰ complex [(dippf)Pd(acrylic acid)] **1c** by reacting of [(dippf)-Pd(nb)] (nb = norbornene) with an excess of acrylic acid in THF [Equation (1)].

$$\begin{array}{l} [(dippf)Pd(nb)] + HOOC-CH=CH_2 \rightarrow \\ [(dippf)Pd(\eta^2-CH_2=CH-COOH)] (1c) + nb \quad (1) \end{array}$$

Isolation of the orange solid and recrystallisation from diethyl ether resulted in orange single crystals. To confirm the structure in the solid state, the X-ray crystal structure analysis of 1c was carried out. Figure 2 reveals the molecule structure which shows that 1c has the same arrangement of the ligands as the related nickel(0) acrylic acid complexes with the olefin part of acrylic acid being coordinated at Pd⁰ centre and with a C=C bond lengths of 1.419(3) Å. Also, the other bond lengths and angles lie within a typical range. The angle between the plane (P1,P2,Pd) and the (Pd, C1,C2) is only 2.27° which undoubtedly shows that the Pd^{0} centre is in a planar environment formed by the two P donor atoms and the carbons C1 and C2 of the olefinic part of the acrylic acid ligand. 1c forms also a dimer in the solid state in which two carboxylic groups are connected by hydrogen bonds.

Figure 2. Molecular structure of **1c** (the formation of hydrogen bonds analogously to fig. 1 is indicated by the dotted lines indicating the points at which the dimer is formed; H atoms except the one at O1, and cocrystallized THF have been omitted clarity). Selected bond lengths [Å] and angles [°]: Pd–C1 2.100(2), Pd–C2 2.154(2), Pd–P1 2.3116(7), Pd–P2 2.3215(8), C1–C2 1.419(3), C2–C3 1.457(3), C3–O1 1.327(3), C3–O2 1.237(3), P1–Pd–P2 105.98(3), P1–Pd–C1 104.35(7), P2–Pd–C2 110.67(7), C1–Pd–C2 38.95(9), plane (P1,P2,Pd)-plane(Pd, C1,C2) 2.27.

Nickela-Cyclic Carboxylates of the Type [(L) NiCH₂CH₂COO] (L = dppf, dippf)

In order to proof whether the isomers of 1, the nickelacyclic carboxylates of the type $[(L)Ni(CH_2CH_2COO)]$ (L: dppf, dippf, dtbpf) (2) are stable compounds, we reacted $[(py)_2Ni(CH_2CH_2COO)]$ with these ligands in DMF at room temperature. This pyridine complex is a labile ligand complex which serves as precursor for many other reactions.^[20–22] Scheme 3 displays that, depending on the bis-(phosphanyl)ferrocene ligands, different products were formed.

Scheme 3. Reactions of bis(phosphanyl)ferrocene ligands with a nickela-lactone.

In contrast to the formation of the thermally unstable complex 2a from dppf and [(py)₂Ni(CH₂CH₂COO)], the reaction with dippf resulted in the formation of the thermally stable nickela-cyclic carboxylate 2b which was isolated as orange crystals in high yields (85%). 2b was fully characterized by elemental analyses, IR, and NMR spectroscopy, and by X-ray analysis of single crystals. In the ¹H NMR spectrum of **2b** in [D₈]THF the Ni-CH₂ protons were observed at $\delta = 0.96$ ppm and those of the CH₂COO unit resonated at $\delta = 1.96$ ppm; each of these signals correspond to two protons. The signals of the CH₃ groups appeared at 1.23-1.54 ppm, the signals of the CH groups were found at 2.20-2.47 ppm and the cp protons were observed as singlets at δ = 4.40 and 4.44 ppm. In addition, the ¹³C NMR spectrum showed the expected simple pattern of signals for the Ni-CH₂ group at 12.4 and for the CH₂-COO- fragment at δ = 37.2 ppm, besides the resonances for the ligand carbons, and in the ${}^{31}P{}^{1}H$ NMR spectrum in [D₇]DMF the ${}^{31}P$ signals appeared at δ = 36.4 and 44.7 ppm. In the IR spectrum the v(C=O) band was found at 1634 cm⁻¹.

Single crystals were grown from DMF at -20 °C and the crystal structure of **2b** has been solved by X-ray diffraction analysis. Its molecule structure is displayed in Figure 3 and shows it to be very similar to the starting complex [(py)₂Ni(CH₂CH₂COO)]^[22] and other closely related nick-ela-cyclic carboxylates.^[1,21] However, due to the disorder of the nickela-cyclic carboxylates is not possible.

Figure 3. Molecular structure of 2b (H atoms have been omitted for clarity).

2a is extremely sparingly soluble in organic solvents preventing complete characterization by NMR spectroscopy. The compound shows the typical v(C=O) band for a nickela-cyclic carboxylate at 1642 cm⁻¹ in nujol suspension. Furthermore, ³¹P NMR measurements in [D₇]DMF at 25 °C gave two signals for the coordinated P atoms in a different chemical environment at $\delta = 19.4$ and 39.0 ppm. In addition, in the ¹H NMR spectrum the two resonances of the coordinated CH₂CH₂COO fragment were observed at $\delta = 0.64$ ppm (as a multiplet of the Ni-CH₂ group) and at $\delta = 1.93$ ppm. The latter appears as a triplet and is assigned to the CH₂COO protons. Comparison of these data with those of the nickela-cyclic carboxylate **2b** suggest that **2a** is also the expected nickela-cyclic carboxylate according to Scheme 3.

2a is a thermally unstable compound. Even at 40 °C in DMF the complex decomposes into a mixture of compounds. One product isolated from the reaction mixture was the nickel(0) complex [(dppf)₂Ni] (**4**). This compound was already generated in situ either by reaction of NiBr₂, dppf and Zn or by reduction of [Ni(acac)₂] using DIBAL-H in the presence of dppf,^[5,6] however to the best of our knowledge it has not been isolated so far. Complex **4** was characterized by elemental analyses, ¹H and ¹³C NMR spectroscopy and by a single crystal structure analysis. Figure 4 shows its molecule structure and contains the most relevant bond lengths and angles in the caption.

The nickel centre is in the tetrahedral environment of four P donor atoms with typical Ni–P bond lengths. In the dppf ligand A the two cp ligands have a synclinal staggered conformation with a torsion angle τ of 43.9°. This conformation is the most common one found for dppf in its metal complexes (characteristic values: $18^{\circ} < \tau < 54^{\circ}$).^[23] In the other ligand B, however, the torsion angle is only 15.0° and the cp ligands have a synperiplanar eclipsed conformation (characteristic region: $0^{\circ} < \tau < 18^{\circ}$).^[23] This different arrangement results in different bite angles (106.3° for P1A– Ni–P2A and 101.6° for P1B–Ni–P2B).

Figure 4. Molecular structure of 4 (H atoms have been omitted for clarity). Selected bond lengths [Å] and angles [°]: Ni–P1A 2.269(2), Ni–P2A 2.238(2), Ni–P1B 2.243(2), Ni–P2B 2.237(2), P1A–Ni–P1B 120.93(4), P1A–Ni–P2A 106.28(5), P1A–Ni–P2B 115.62(4), P1B–Ni–P2A 106.47(5), P1B–Ni–P2B 101.64(4), P2A–Ni–P2B 115.62(4).

Complexes of the Type [(L)Ni(ethylene)] [L: dtbpf, (dippf)]

The steric bulky ligand dtbpf yielded in the reaction with $[(py)_2Ni(CH_2CH_2COO)]$ under similar conditions a different product compared to the dippf complex. In this case reductive decoupling of the NiCH_2CH_2COO- unit was observed resulting in the formation of the nickel(0) ethylene complex [(dtbpf)Ni(ethylene)] **3c** and CO₂ (Scheme 1). This demonstrates how sensitive the reactivity can be influenced by the steric demand of the ligands. **3c** was characterized by NMR spectroscopy in [D₇]DMF and by an X-ray analysis of single crystals grown from DMF. When the nickelacycle **2b** was heated at 80 °C, reductive decoupling was observed as well, resulting in the formation of [(dippf)Ni(ethylene)] (**3b**) in good yields.

As expected for a symmetrical structure in solution, the ${}^{31}P{}^{1}H$ NMR spectrum of **3c** in [D₇]DMF at room temperature showed only one signal at $\delta = 65.6$ ppm. In the ${}^{1}H$ NMR spectrum the ethylene protons appeared at $\delta = 1.86$ ppm. The methyl protons of the *tert*-butyl group resonated at $\delta = 1.35$ ppm and the singlets at $\delta = 4.06$ and 4.21 ppm (each integrating to four protons) were assigned the cp ring protons. Single crystals of **3c** were grown from DMF suitable for X-ray structure determination, and its molecule structure is shown in Figure 5.

The nickel(0) centre is in the distorted tetrahedral environment of the two P donor groups and the carbons of the ethylene ligand with typical bond lengths for the Ni–P and Ni–C bonds. As expected, the double bond of the coordinated ethylene ligand [C(1)–C(2) 1.399(4) Å] is significantly elongated compared to free ethylene.

It is noteworthy, that the hitherto unknown ethylene complexes with 1,1'-bis(phosphanyl)ferrocene ligands can also be formed by other methods. For example, the ethylene

Figure 5. Molecular structure of **3c** (H atoms have been omitted for clarity). Selected bond lengths [Å] and angles [°]: Ni–C1 1.980(3), Ni–C2 1.984(3), Ni–P1 2.1893(6), Ni–P2 2.1908(6), C1–C2 1.399(4), P1–Ni–P2 111.95(3), P1–Ni–C1 103.96(9), P2–Ni–C2 104.03(9), C1–Ni–C2 41.3(2), plane (P1,P2,Ni)-plane(Ni,C1,C2) 15.71.

complex **3b** was additionally prepared by ligand displacement from (cyclododeca-1,5,9-triene)nickel(0) [Equation (2)].

$$[Ni(cdt)] + dippf + C_2H_4 \rightarrow [(dippf)Ni(C_2H_4)] + cdt$$
(2)

NMR spectroscopic data are very similar to those of the dtbpf complex **3c**, and the crystal structure of single crystals of **3b** (not depicted) is also comparable with that of the closely related complex **3c** and need therefore no further discussion.

Conclusions

Complexes of the type $[(L)M(\eta^2-CH_2=CH-COOH)]$ (1a– 1c) are the first Ni- and Pd⁰ complexes with acrylic acid as olefin-like ligand. Due to the rigidity and the bulkiness of the ferrocenyl-bisphosphane ligands these complexes are surprisingly stable and do not thermally interconvert into the isomeric nickela-lactones of the type $[(L)Ni(CH_2CH_2-COO)]$ (2) which could be independently prepared by ligand exchange from $[(py)_2Ni(CH_2CH_2COO)]$ as thermally stable compounds. The nickela-lactones 2b and 2c react at heating under reductive decoupling to yield the new ethylene complexes of the type 3, however, the isomerization of the complexes of the type 2 to form the acrylic acid complexes 1 was not observed.

Experimental Section

General: Infrared spectra were recorded using a Perkin–Elmer 2000 FT-IR; ¹H-NMR spectra were recorded on a Bruker 400 MHz/ 200 MHz spectrophotometer. The mass spectra were recorded using a SSQ 170, Finnigan Mat. Electro spray mass spectra were recorded on a Finnnigan MAT, MAT 95 XL. Values for *m/z* are for the most intense peak of isotope envelope.

All manipulations were carried out by using modified Schlenk techniques under an atmosphere of argon. Prior to use, THF, benzene and diethyl ether were dried with potassium hydroxide and distilled from sodium/benzophenone. DMF was dried with CaH₂.

dppf, dippf, and dtbpf were prepared in analogy to known procedures by reaction of *n*BuLi/tmeda with ferrocene, followed by addition of the chlorodiphenylphoshane, chlorodiisopropylphosphane or chlorodi-*tert*-butylphosphane.^[24–27] [Ni(cod)₂],^[28] [(py)₂-Ni(C₂H₄COO)]^[22] and [Pd(η^2 -C₇H₁₀)₃]^[29] were prepared according to literature procedures.

[(dppf)Ni(η^2 -CH₂=CH-COOH)] (1a): A solution of dppf (2.67 g, 4.82 mmol) in THF (30 mL) was added to solid [Ni(cod)₂] (1.32 g, 4.80 mmol). The suspension was stirred until all solids had dissolved. Afterwards the stirred solution was cooled to 0 °C and acrylic acid (0.37 g, 5.13 mmol) was added, resulting in formation of a yellow precipitate. This solid was isolated by filtration and dried in a vacuum. Yield: 2.83 g (71%). Suitable crystals of (1a)·2THF for X-ray measurement were obtained by slowly cooling a saturated solution in THF from room temperature to 5 °C. In a similar manner, crystals of [(dppf)Ni(η²-CH₂=CH-COOH)]· 1.5DMF were obtained from a solution of DMF. Those crystals were used for elemental analysis. C_{41.5}H_{42.5}FeN_{1.5}NiO_{3.5}P₂ (794.8) calcd. C 62.71, H 5.39, N 2.64; found C 62.11, H 5.54, N 2.53. ¹H NMR ([D₈]THF, 25 °C): δ = 1.95 (m, 1 H, CH₂=), 2.25 (m, 1 H, CH₂=), 2.98 (m, 1 H, CH=), 3.89 (s, 1 H, CH cp), 4.07 (s, 1 H, CH cp), 4.22 (s, 2 H, CH cp), 4.26 (s, 1 H, CH cp), 4.29 (s, 1 H, CH cp), 4.35 (s, 2 H, CH cp), 7.28-7.80 (m, 20 H, CH ph), 9.64 (br., 1 H, COOH). ¹³C{¹H} NMR ([D₈]THF, 25 °C): 43.9 (d, J_{P,C} = 19.6 Hz, CH₂=). 49.8 (d, $J_{P,C}$ = 11.6 Hz, CH=), 71.1 (dd, $J_{P,C}$ = 7.3 Hz, $J_{P,C}$ = 4.1 Hz, CH cp), 72.9 (d, $J_{P,C}$ = 6.4 Hz, CH cp), 74.4 (dd, $J_{P,C}$ = 20.0 Hz, $J_{P,C}$ = 6.0 Hz, CH cp), 75.3 (dd, $J_{P,C}$ = 17.5 Hz, $J_{P,C}$ = 13.8 Hz, CH cp), 81.9 (dd, $J_{P,C}$ = 40.4 Hz, $J_{P,C}$ = 5.1 Hz, C cp), 82.2 (dd, $J_{P,C}$ = 40.4 Hz, $J_{P,C}$ = 5.1 Hz, C cp), 128.4 (dd, $J_{P,C}$ = 7.5 Hz, $J_{P,C}$ = 2.9 Hz, CH), 128.7 (d, $J_{P,C}$ = 9.3 Hz, CH), 129.3 (d. $J_{P,C}$ = 8.3 Hz, CH), 130.2 (d, $J_{P,C}$ = 20.1 Hz, CH), 134.0 (dd, $J_{PC} = 12.2 \text{ Hz}, J_{PC} = 5.9 \text{ Hz}, \text{ CH}$, 135.5 (dd, $J_{PC} = 49.6 \text{ Hz}, J_{PC}$ = 15,2 Hz, CH), 137.2 (d, ${}^{1}J_{P,C}$ = 37.8 Hz, C), 137.2 (d, ${}^{1}J_{P,C}$ = 37.8 Hz, C), 175.9 (COOH). ³¹P{¹H} NMR ([D₈]THF, 25 °C): δ = 26.7 (d, ${}^{2}J_{P,P}$ = 21.9 Hz), 32.6 (d, ${}^{2}J_{P,P}$ = 21.9 Hz).

[(dippf)Ni(η²-CH₂=CH-COOH)] (1b): A solution of dippf (2.21 g, 5.28 mmol) in THF (30 mL) was added to [Ni(cod)₂] (1.45 g, 5.27 mmol). The mixture was stirred until all solids had dissolved and then cooled to 0 °C. At this temperature acrylic acid (0.38 g, 5.27 mmol) was added drop wise. The resulting reaction mixture was stored at 5 °C overnight. Afterwards the solvent was removed by distillation under reduced pressure and ether was added to the remaining residue, resulting in the formation of a yellow precipitate. This solid was isolated by filtration and dried in a vacuum. Suitable crystals for X-ray measurement were obtained by layering a saturated solution of 1b in DMF with ether. Yield: 1.76 g (60.6%). C₂₅H₄₀FeNiO₂P₂ (549.0) calcd. C 54.68, H 7.34; found C 54.36, H 7.53. ¹H NMR ([D₈]THF): δ = 0.65 (dd, J = 10.3 Hz, J = 3.6 Hz, 3 H, CH₃), 0.74 (m, 3 H, CH₃), 0.65 (dd, J = 10.3 Hz, J= 3.6 Hz, 3 H, CH₃), 1.03 (dd, *J* = 15.6 Hz, *J* = 7.1 Hz, 3 H, CH₃), 1.15 (dd, J = 13.7 Hz, J = 6.9 Hz, 3 H, CH₃), 1.27–1.56 (m, 12 H, CH₃), 1.85 [m, 2 H, CH(CH₃)₂], 1.97 [m, 2 H, CH(CH₃)₂], 2.57 (br., 1 H, =CH₂), 2.88 (br., 1 H, CH=), 3.94 (s, 2 H, CH cp), 3.99 (s, 1 H, CH cp), 4.01 (s, 1 H, CH cp), 4.03 (s, 2 H, CH cp), 4.16 (s, 1 H, CH cp), 4.29 (s, 1 H, CH cp), 10.35 (br., 1 H, COOH). ¹³C{¹H} NMR ([D₈]THF): δ = 17.7 (CH₃), 17.8 (CH₃), 19.2 (CH₃), 19.4 (CH₃), 20.5 (d, ${}^{2}J_{P,C}$ = 7.3 Hz, CH₃), 21.2 (CH₃), 22.5 (d, ${}^{2}J_{P,C}$ = 9.2 Hz, CH₃), 22.6 (d, ${}^{2}J_{P,C}$ = 8.7 Hz, CH₃), 26.3 (d, ${}^{1}J_{P,C}$ =

[(dippf)Pd(nb)]: A solution of dippf (0.36 g, 0.86 mmol) in THF (20 mL) was cooled to $-30 \text{ }^{\circ}\text{C}$ and added to solid $[(nb)_3\text{Pd}]$ (0.30 g, 0.77 mmol) at this temperature. The stirred solution was allowed to slowly warm to room temperature. Afterwards half of the solvent was distilled of under reduced pressure. The remaining orange coloured solution was stored at -20 °C for several days, resulting in the formation of orange red crystals. These crystals were separated by filtration and dried in a vacuum. From the mother liquor a second crop of product was obtain by further reduction of the volume and layering with diethyl ether. Yield: 120 mg (25%). C₂₉H₄₆P₂FePd (618.9) calcd. C 56.28, H 7.49; found C 56.12, H 7.52. ¹H NMR ([D₈]THF, 25 °C): $\delta = 0.58$ (d, ² $J_{H,H} = 7.6$ Hz, 1 H, CHH' bridge), 1.05–1.30 (m, 15 H, 4×CH₃, 2×CHH', CHH' bridge), 1.52 (m, 2 H, 2×CHH'), 2.19 (m, ${}^{2}J_{H,P}$ = 6.0 Hz, 4 H, CH *i*Pr), 2.88 (s, 2 H, CH), 2.99 (d, ${}^{2}J_{H,P}$ = 6.0 Hz, 2 H, CH), 4.23 (s, 2 H, CH cp), 4.28 (s, 6 H, CH cp). ¹³C{¹H} NMR ([D₈]THF): $\delta = 20.0$ (t, ${}^{2}J_{C,P} = 5.0$ Hz, $4 \times CH_{3}$ *i*Pr), 20.4 (br., $4 \times CH_{3}$ *i*Pr), 26.9 (t, ${}^{1}J_{C,P}$ = 6.3 Hz, 2×CH *i*Pr), 27.0 (t, ${}^{1}J_{C,P}$ = 7.6 Hz, 2×CH *i*Pr), 29.9 (t, ${}^{4}J_{CP}$ = 5.0 Hz, 2×CHH'), 43.4 (s, CHH'), 45.6 (s, $2 \times CH$), 64.2 (pseudo-dt, $2 \times = CH$ -), 69.8 (s, $4 \times CH$ cp), 73.7 (t, ${}^{2}J_{C,P}$ = 3.8 Hz, 4×CH cp), 85.3 (t, ${}^{1}J_{C,P}$ = 9.5 Hz, 2×C cp). ³¹P{¹H} NMR (81 MHz, [D₈]THF, 25 °C): δ = 36.4 (s).

[(dippf)Pd(\eta^2-CH₂=CH-COOH)] (1c): Acrylic acid (0.03 mL, 0.44 mmol) was added to a solution of [(dippf)Pd(nb)] (40 mg, 0.065 mmol) in THF (1 mL) at 0 °C with rapid stirring. The resulting mixture was warmed to room temperature and stirred for additional 30 min. Afterwards the solvent was completely removed by distillation under reduced pressure. The remaining orange red sticky oil was treated with diethyl ether (2 mL) and stirred for 20 min. The resulting suspension was filtered and the clear yellow solution was stored at -20 °C. The isolated solid was redissolved in a few drops of THF and that solution was kept at 5 °C for several days. From both solutions, suitable crystals for X-ray measurement were obtained; [(dippf)Pd(η^2 -CH₂=CH-COOH)] from ether, [[(dippf)Pd(η^2 -CH₂=CH-COOH)] from there, more determined.

[(dppf)Ni(C₂H₄-COO)] (2a): Yellow dppf (0.77 g, 1.39 mmol) was added to a suspension of green [(py)₂Ni(C₂H₄COO)] (0.40 g, 1.38 mmol) in DMF (8 mL) at 0 °C. The solution was allowed to slowly warm to room temperature, while the starting materials dissolved and a yellow precipitate was formed. To remove liberated pyridine, 2 mL of DMF was distilled of under reduced pressure at room temperature. Afterwards the yellow solid was isolated by filtration, washed with diethyl ether and dried in a vacuum. Yield: 0.91 g (96%) yellow powder. ¹H NMR ([D₇]DMF, 25 °C): δ = 0.64 (m, 2 H, Ni-CH₂), 1.93 (t, *J* = 6.9 Hz, 2 H, CH₂-COO), 4.45 (s, 4 H, CH cp), 7.45–8.00 (m, 20 H Phenyl). ³¹P{¹H} NMR ([D₇]DMF, 25 °C): δ = 19.4 (br), 39.0 (br). IR (nujol): \tilde{v} = (C=O) 1642 cm⁻¹.

[(dippf)Ni(C₂H₄-COO)] (2b): A solution of dippf (0.83 g, 1.98 mmol) in DMF (4 mL) was added to a suspension of green $[(py)_2Ni(C_2H_4COO)]$ (0.49 g, 1.70 mmol) in DMF (4 mL) at room temperature. The resulting solution was stirred for 1 h. Meanwhile an orange yellow precipitate was formed. The solid was afterwards collected by filtration and dried in a vacuum. Suitable crystals for X-ray measurement were obtained from a saturated solution of the

complex in DMF at room temp. und subsequent cooling to -20 °C. Yield: 0.8 g (85%). C25H40P2O2FeNi (549.08) calcd. C 54.69, H 7.34; found. C 54.21, H 7.39. ¹H NMR ([D₈]THF, 25 °C): δ = 0.96 $(tdd, {}^{3}J_{H,H} = 6.9 \text{ Hz}, {}^{3}J_{P,H} = 4.0 \text{ Hz}, {}^{3}J_{P,H} = 8.7 \text{ Hz}, 2 \text{ H}, \text{Ni-CH}_{2}),$ 1.23–1.54 (m, 24 H, CH₃), 1.96 (tdd, ${}^{3}J_{H,H} = 7.0$ Hz, ${}^{4}J_{P,H} = 5.1$ Hz, ${}^{4}J_{P,H}$ = 7.2 Hz, 2 H, CH₂-COO), 2.20–2.47 (m, 4 H, CH), 4.40 (m, 4 H, CH cp), 4.44 (m, 4 H, CH cp). ${}^{13}C{}^{1}H$ NMR ([D₈]THF, 25 °C): δ = 12.4 (dd, J = 31.6 Hz, J = 59.9 Hz, Ni-CH₂), 19.8 (d, J = 11.5 Hz, CH₃), 20.6 (d, J = 5.7 Hz, CH₃), 37.2 (dd, J = 2.7 Hz, J = 4.6 Hz, CH_2 -COO), 71.1 (d, J = 4.5 Hz, CH cp), 71.9 (d, J =3.9 Hz, CH' cp), 73.3 (d, J = 6.3 Hz, CH cp), 73.5 (d, J = 6.2 Hz, CH' cp), 82.2 (d, J = 10.7 Hz, C cp), 82.8 (d, J = 10.7 Hz, C' cp), 185.5 (m, COO). The signals for CH groups of the isopropyl substituents overlap with the signals of the used solvent and were therefore not detected. ³¹P{¹H} NMR ([D₇]DMF, 25 °C): δ = 36.5 (d, $J_{P,P} = 14.4 \text{ Hz}$), 44.7 (d, $J_{P,P} = 14.4 \text{ Hz}$). IR (nujol): $\tilde{v} = (C=O)$ 1634 cm⁻¹ (s).

[(dippf)Ni(η^2 -C₂H₄)] (3b): a) A suspension of [(dippf)Ni(C₂H₄-COO)] (2b) (200 mg, 0.36 mmol) in DMF (5 mL) was heated to 80 °C. The resulting clear solution was stirred at this temperature for additional 3 h. Upon slow cooling to room temperature orange coloured crystals were formed overnight. These crystals were collected by filtration and dried in a vacuum. A second crop of product was obtained by storing the mother liquor at 0 °C for 3 d. Yield: 130 mg (70%). C₂₄H₄₀FeNiP₂ (505.06) calcd. C 57.07, H 7.98; found 57.17, H 8.16. ¹H NMR (C₆D₆, 25 °C): δ = 1.13 (sext, J 6.8 Hz, 24 H, CH₃), 2.05 (m, 4 H, CH *i*Pr), 2.19 (br., 4 H, C₂H₄), 4.06 (br., 4 H, CH cp), 4.21 (br., 4 H, CH cp). ¹³C{¹H} NMR (C₆D₆, 25 °C): δ = 19.9 (t, ²J_{P,C} = 3.2 Hz, CH₃), 20.1 (t, ²J_{P,C} = 3.2 Hz, CH₃), 26.0 (t, ${}^{1}J_{P,C}$ = 10.6 Hz, CH *i*Pr), 34.7 (t, ${}^{2}J_{P,C}$ = 7.3 Hz, CH₂), 69.3 (br., CH, cp), 72.7 (t, ${}^{2}J_{P,C}$ = 2.9 Hz, CH cp), 86.4 (t, ${}^{1}J_{PC}$ = 12.6 Hz, C cp). ${}^{31}P{}^{1}H$ NMR (C₆D₆, 25 °C): δ = 42.4 (s).

 $[(dtbpf)Ni(\eta^2-C_2H_4)]$ (3c): A solution of dtbpf (0.50 g, 1.05 mmol) in DMF (3 mL) was added to a suspension of green [(py)₂Ni(C₂H₄₋ COO)] (0.29 g, 1.00 mmol) in DMF (3 mL) at room temperature. The resulting orange brown solution was stirred for 2 h and afterwards 3 mL of DMF were distilled of under reduced pressure at room temperature. The resulting orange coloured precipitate was collected by filtration and dried in a vacuum. Suitable crystals for X-ray measurement were obtained from a saturated solution of the complex in DMF at room temp. und subsequent cooling. Yield: 0.3 g (50%). C₂₈H₄₈P₂FeNi (561.18). ¹H NMR ([D₇]DMF, 25 °C): $\delta = 1.35$ (d, ${}^{3}J_{\text{H,P}} = 11.5$ Hz, 36 H, CH₃ tBu), 1.80 (s, 4 H, CH₂), 4.40 (m, 4 H, CH cp), 4.45 (br., 4 H, CH cp). ¹³C{¹H} NMR ([D₈]-THF, 25 °C): δ = 32.0 (s, CH₃ *t*Bu), 36.6 (t, ²*J*_{C,P} = 7.0 Hz, C₂H₄), 37.3 (t, ${}^{1}J_{C,P}$ = 6.2 Hz, C *t*Bu), 69.6 (s, CH cp), 75.4 (s, CH cp), 87.0 (t, ${}^{1}J_{C,P}$ = 8.4 Hz, C cp). ${}^{31}P{}^{1}H}$ NMR ([D₇]DMF, 25 °C): δ = 65.6 (s).

[(dppf)₂Ni] (4);^[5,6] A suspension of **2a** in THF was heated to 40 °C and DMF was added with rapid stirring until nearly all solids have dissolved. The resulting solution was filtered through celite and stored for 2 weeks at 5 °C. During this period, some precipitate was formed and afterwards removed by decantation. The remaining solution was concentrated in vacuo until all THF was removed. The residual orange brown coloured solution in DMF was stored for several weeks at -20 °C, after which orange red crystals had occurred. These crystals were collected by filtration and dried in a vacuum. The yield was not determined. C₆₈H₆₀P₄Fe₂Ni (1171.51) calcd. C 69.72, H 5.16; found C 69.82, H 5.09. ¹HNMR ([D₈]THF, 25 °C): δ = 3.97 (s, 8 H, CH cp), 4.10 (s, 8 H, CH cp), 6.84 (pt, *J* = 7.4 Hz, 16 H, *o*-CH ph), 7.01 (pt, *J* = 7.2 Hz, 8 H, *p*-CH ph),

7.45–7.55 (m, 16 H, *m*-CH ph). ¹³C{¹H} NMR ([D₈]THF, 25 °C): δ = 70.5 (s, 8×CH cp), 75.2 (s, 8×CH cp), 87.5 (m, 4×C cp), 127.4 (s, 16×*m*-CH ph), 128.1 (s, 8×*p*-CH ph), 135.1 (pt, *J*_{C,P} = 7.5 Hz, 16×*o*-CH ph), 142.0 (m, 8×C ph).

X-ray Crystallographic Studies: The intensity data for the compounds were collected on a Nonius KappaCCD diffractometer by using graphite-monochromated Mo- K_{α} radiation. Data were corrected for Lorentz and polarization effects, but not for absorption effects.^[30,31] The structures were solved by direct methods (SHELXS^[32]) and refined by full-matrix least-squares techniques against F_o^2 (SHELXL-97^[33]). All hydrogen atoms were included at calculated positions with fixed thermal parameters. All non-hydrogen atoms were refined anisotropically.^[4] XP (SIEMENS Analytical X-ray Instruments, Inc.) was used for structure representations.
