### Just Accepted

“Just Accepted” manuscripts have been peer-reviewed and accepted for publication. They are posted online prior to technical editing, formatting for publication and author proofing. The American Chemical Society provides “Just Accepted” as a free service to the research community to expedite the dissemination of scientific material as soon as possible after acceptance. “Just Accepted” manuscripts appear in full in PDF format accompanied by an HTML abstract. “Just Accepted” manuscripts have been fully peer reviewed, but should not be considered the official version of record. They are accessible to all readers and citable by the Digital Object Identifier (DOI®). “Just Accepted” is an optional service offered to authors. Therefore, the “Just Accepted” Web site may not include all articles that will be published in the journal. After a manuscript is technically edited and formatted, it will be removed from the “Just Accepted” Web site and published as an ASAP article. Note that technical editing may introduce minor changes to the manuscript text and/or graphics which could affect content, and all legal disclaimers and ethical guidelines that apply to the journal pertain. ACS cannot be held responsible for errors or consequences arising from the use of information contained in these “Just Accepted” manuscripts.

# Metal-Free Dehomologative Oxidation of Arylacetic Acids for the Synthesis of Aryl Carboxylic Acids

TOC/Abstract Graphics

## ABSTRACT:

A novel I<sub>2</sub>-promoted direct conversion of arylacetic acids into aryl carboxylic acids under metal-free conditions has been described. This remarkable transformation involves decarboxylation followed by oxidation reaction enabled just by using DMSO as the solvent as well as an oxidant. Notably, aryl carboxylic acids are isolated by simple filtration technique and obtained in good to excellent yields. This protocol is free from chromatographic purification which makes it applicable for the large scale synthesis.

## INTRODUCTION

Aryl carboxylic acid is an important structural unit in organic chemistry, ubiquitous in various natural products, pharmaceuticals, dyes, polymers, agricultural and bioactive molecules.<sup>1</sup> Besides this, aryl carboxylic acids are key synthetic building blocks owing to their further facile

transformation into esters, amides, acid chlorides and heterocycles. Thus, the development of novel methods for their synthesis is of great interest to organic chemists. Conventionally, benzoic acid is prepared *via* partial oxidation of toluene using cobalt or manganese naphthenates as catalysts.<sup>2</sup> The global production capacity of aryl carboxylic acids was estimated to be 480,000 tons in 2014 and is likely to exceed 620,000 tons by 2023 with gains of over 3.2% from 2016 to 2023.<sup>3</sup> Due to the increasing demand of benzoic acid and its derivatives various oxidizing methods have been developed for their synthesis.

**Figure 1.** Methods for the preparation of aryl carboxylic acid

1  
2  
3 The most widely used method involves direct oxidation of methylarenes or aldehydes to aryl  
4  
5 carboxylic acids. Stoichiometric amounts<sup>4</sup> of metal oxidants such as KMnO<sub>4</sub>, Na<sub>2</sub>Cr<sub>2</sub>O<sub>7</sub>, CrO<sub>3</sub>,  
6  
7 CeO<sub>2</sub>, TiO<sub>2</sub>, or NaIO<sub>4</sub> and catalytic amounts<sup>5a-5j</sup> of Co(OAc)<sub>2</sub>, Cu–Fe, ZnO, MnCO<sub>3</sub>, AlBr<sub>3</sub>,  
8  
9 FeCl<sub>3</sub>, NiII(TPA), RuCl<sub>3</sub>, CuCl and Bi salts have been successfully employed for these oxidative  
10  
11 processes. Domínguez *et al.*<sup>5k</sup> have developed expedient and viable protocol for the aerobic  
12  
13 oxidation of phenylacetic acid through oxygen-mediated cleavage of C–C bond to aryl  
14  
15 carboxylic acids by using 1,2,4-triazole-type ligands and nickel(II) bromide. In addition, non-  
16  
17 metal oxidants such as urea, hydrogen peroxide, HNO<sub>3</sub>, HBr, and CBr<sub>4</sub>–PPh<sub>3</sub> have also been  
18  
19 used.<sup>6</sup> Aryl carboxylic acids have also been prepared from various starting materials (Figure  
20  
21 1).<sup>2,4,7</sup> Recently, Wu *et al.* have reported novel protocol for the preparation of aryl carboxylic  
22  
23 acids *via* palladium-catalyzed hydroxycarbonylation of aryl halides.<sup>7g</sup> However, inherent  
24  
25 drawback of either environmental pollution or difficulty in metal reagent separation from the  
26  
27 products are associated with the stoichiometric use of metallic oxidants. Furthermore, metal-free  
28  
29 reagents<sup>8</sup> such as Oxone, porphyrin sensitizer, NHC, biomimetic-flavin have also been used to  
30  
31 achieve this transformation. Most of these methods suffer from limitations of toxicity or harsh  
32  
33 reaction conditions. Hence the search for novel and more efficient methods which involve the  
34  
35 use of cheap and biodegradable reagents is highly desirable.

36  
37  
38 Although several diverse approaches have been reported for the synthesis of substituted aryl  
39  
40 carboxylic acids, development of practical and sustainable synthetic method still serve to be an  
41  
42 attractive goal for synthetic organic chemist. In this context, based on the literature reports and  
43  
44 our endeavours for the exploration of simple and green methods for the synthesis of biologically  
45  
46 important compounds,<sup>9</sup> we herein wish to report a convenient and metal-free process for the  
47  
48

## 20 **RESULTS AND DISCUSSION**

21  
22 Inspired by recently developed iodine-mediated oxidative C-H functionalization reactions by  
23 using DMSO as a solvent as well as an oxidant,<sup>10</sup> we envisaged that halide-containing reagent  
24 could be used as the promoter for the functionalization of C-H bond in arylacetic acids. Initially,  
25 we studied the influence of the different catalysts or promoters, oxidants and solvents on the  
26 oxidative dehomologation reaction of phenylacetic acid (**1a**). Phenylacetic acid (**1a**) with varying  
27 concentration of I<sub>2</sub> (0.2-1.0 eq., Table 1, entries 1-4) and TBHP (5.0 eq.) as an oxidant at 100 °C  
28 offered benzoic acid **2a** in low yields (12-22%) while slightly better yield (29%) of the product  
29 was obtained at 120 °C (Table 1, entry 5). A slight drop in the yield (23%) was observed when  
30 1.5 eq. of I<sub>2</sub> was used (Table 1, entry 6). With a view to improve the yield of the product, various  
31 oxidants such as DTBP, TBPB, CHP, DCP, H<sub>2</sub>O<sub>2</sub> (Table 1, entries 7-11) were screened for this  
32 reaction but these oxidants afforded product **2a** in low yields (17-26%). The reaction without the  
33 use of molecular iodine failed to produce desired product, this implied the importance of iodine  
34 as a promoter for this reaction (Table 1, entry 12).

50

51  
52 Various promoters such as NIS, KI, CuI, and TBAI were also used instead of iodine for this  
53 reaction. But, these promoters could afford product **2a** in low yields (14-28%) (Table 1, entries  
54 13-16). We also tried the reaction of phenylacetic acid (**1a**) with 1.0 eq. of I<sub>2</sub> in DMSO. To our  
55  
56  
57  
58  
59  
60

delight, benzoic acid (**2a**) was obtained in 68% (Table 1, entry 17). Inspired with this observation, we performed this reaction by using 1.5 eq. of I<sub>2</sub> in DMSO at 120 °C for 28 h and surprisingly enhancement in the yield upto 87% was observed (Table 1, entry 18). In order to check the possibility of further increase in the yield of **2a**, various solvents such as water, DMSO, DMF, CH<sub>3</sub>CN and 1,4-dioxane were also used in combination with TBHP (5.0 eq.) (Table 1, entries 19-23). Use of water as a solvent resulted in 13% yield of the product **2a** (Table 1, entry 19) whereas in the case of DMSO also lower yield was obtained (35%) (Table 1, entry 20). Trace amount of product formation was observed in DMF, CH<sub>3</sub>CN and 1,4-dioxane (Table 1, entries 21-23). Albeit, the use of I<sub>2</sub> (1.5 eq.) as a promoter, DMSO as an oxidant as well as a solvent at 120 °C was found to be the best reaction condition.

**Table 1. Optimization of reaction conditions<sup>a</sup>**

entry	catalyst / promoter (eq.)	oxidant	solvent	temp. (°C)	yield (%)

<sup>a</sup>Reaction conditions: phenylacetic acid **1a** (1.0 mmol), catalyst (0.2-0.5 mmol) or promoter (1.0-1.5 mmol) and oxidant (5.0 mmol) or solvent (3 mL) were heated at 100-120 °C for 28 h in sealed tube. <sup>b</sup>in the absence of I<sub>2</sub>. <sup>c</sup>I<sub>2</sub> (1.0 mmol), 70% aq. TBHP (5.0 mmol) and solvent (3 mL). TBHP = *tert*-butyl hydroperoxide, DTBP = di-*tert*-butyl peroxide, TBPB = *tert*-butyl peroxybenzoate, CHP = cumene hydroperoxide, DCP = dicumyl peroxide, H<sub>2</sub>O<sub>2</sub> = hydrogen peroxide.

In order to explore the generality of this protocol for the synthesis of substituted benzoic acids, various arylacetic acids (**1**) were examined under the optimized reaction condition (Table 2). The protocol is highly robust and can tolerate a variety of electron-withdrawing, electron-donating and halogen substituents in all positions. The reactions of phenylacetic acids with electron-withdrawing substituents such as 3-nitro- and 4-nitro- proceeded smoothly to afford the corresponding products **2b** and **2c** in 86% and 90% yield, respectively. Phenylacetic acids with methyl group were easily tolerated under the optimized reaction condition and were selectively converted into the corresponding benzoic acids **2d** and **2e** in moderate yields. The substrate scope was also extended to various halogen substituted phenylacetic acids, which can offer the possibility of further synthetic elaboration. The reaction of phenylacetic acids with halogen substituents (2-Cl, 2-I, 4-F, 4-Br and 4-bromo-1,3-phenylenediacetic acid) proceeded efficiently to give the corresponding benzoic acids in good yields (**2f-2j**, 83-89%). Under optimized reaction condition 1,2- and 1,3-phenylenediacetic acid were successfully converted into phthalic acid (**2k**) and isophthalic acid (**2l**), respectively, in excellent yields.

**Table 2. Substrate scope with various arylacetic acids<sup>a</sup>**

**2a**, 87%, 28 h**2b**, 86%, 26 h**2c**, 90%, 24 h**2d**, 85%, 28 h**2e**, 84%, 28 h**2f**, 83%, 25 h**2g**, 87%, 26 h**2h**, 88%, 25 h**2i**, 89%, 26 h**2j**, 88%, 25 h**2k**, 90%, 24 h**2l**, 87%, 26 h**2m**, 84%, 26 h**2n**, 82%, 27 h**2o**, 83%, 28 h**2p**, 84%, 28 h**2q**, 83%, 28 h**2r**, 85%, 27 h**2s**, 88%, 26 h**2t**, 65%, 25 h**2u**, 62%, 26 h**2v**, 57%, 28 h

<sup>a</sup>Reaction conditions: arylacetic acid **1** (1.0 mmol), I<sub>2</sub> (1.5 mmol) and DMSO (3 mL) were heated at 120 °C in sealed tube.

The electron rich phenylacetic acids such as 2-hydroxy, 2,6-dihydroxy, 2,4-dihydroxy, 2,6-dimethoxy, 3,4-dimethoxy and 4-methoxy underwent dehomologative oxidation reaction successfully to afford the corresponding benzoic acids (**2m-2r**) in good yields. Naphthalene-1-acetic acid was also easily transformed into the 1-naphthoic acid (**2s**) in 88% yield.

The scope of this reaction was extended to various heterocyclic arylacetic acids such as furan-2-acetic acid and pyridine, thiophene-3-acetic acid. The reaction of furan-2-acetic acid furnished the furan-2-carboxylic acid (**2t**) in 65% yield whereas thiophene- and pyridine-3-acetic acid offered corresponding carboxylic acids **2u** and **2v** in 62% and 57% yield, respectively. Amino, alcohol and thiol substituents on the phenyl ring of arylacetic acid were not tolerated under the standard reaction condition.

In view of the broad substrate scope and environmentally benign approach the present method was evaluated for the gram scale synthesis of benzoic acid (**2a**). Gratifyingly, 5 g of phenylacetic acid produced 3.9 g of benzoic acid (87%) under the optimized reaction condition. Thus, this protocol can be applied for the gram scale synthesis of benzoic acids.

### Scheme 2. Control experiments

1  
2  
3 To understand the mechanism of this reaction, we performed some control experiments. To  
4 confirm the formation of benzaldehyde (**1ac**) as an intermediate in this transformation, the  
5 reaction of benzaldehyde (**1ac**) under the standard condition was carried out which afforded  
6 benzoic acid (**2a**) in 76% yield (Scheme 2a). This result clearly indicated that the benzaldehyde  
7 (**1ac**) was the intermediate in dehomologative oxidation reaction. Further to affirm the role of  
8 DMSO as an oxidant, a reaction was performed by using 1.5 eq. of iodine and *N,N*-dimethyl  
9 formamide (DMF) as a solvent, which failed to give the product **2a** (Scheme 2b). For additional  
10 support, we have also tried the reaction of phenyl acetic acid under optimized reaction condition  
11 in N<sub>2</sub> and argon atmosphere. In both the cases, the formation of benzoic acid was observed in  
12 78% and 80% respectively (Scheme 2c). These results clearly highlighted the key dual role of  
13 DMSO.

30 A plausible mechanistic pathway of this dehomologative oxidation of phenylacetic acid (**1a**)  
31 into benzoic acid by using molecular iodine as a promoter with dimethyl sulfoxide (DMSO) in  
32 the dual role is depicted in Scheme 3. Initially, iodination<sup>11</sup> of phenylacetic acid occurs in the  
33 presence of molecular iodine to afford iodo-( $\alpha$ -iodophenyl)-acetate (**1aa**). Intermediate **1aa** on  
34 decarboxylative Kornblum oxidation<sup>12</sup> gives benzaldehyde (**1ac**), which was confirmed by using  
35 TLC, GC-MS, and <sup>1</sup>H NMR analysis. Benzaldehyde (**1ac**) on oxidation forms benzoic acid **2a**.

## Conclusion

In summary, we have developed an efficient and unique I<sub>2</sub>-promoted synthesis of aryl carboxylic acids *via* C-H functionalization of arylacetic acids followed by decarboxylative oxidation. This protocol is highly green and practical due to the use of inexpensive DMSO as an oxidant as well as solvent with easy workup procedure. Metal-free condition, broad substrate scope with diverse substitution pattern and operational simplicity are noteworthy features of this protocol.

## EXPERIMENTAL SECTION

### General Information

Chemical reagents were purchased from commercial suppliers and all reactions were performed in a sealed tube. The reaction progress was monitored by using TLC performed on aluminium plates (0.25 mm, E. Merck) precoated with silica gel Merck 60 F-254. Developed TLC plates were visualized under a short-wavelength UV lamp. Reactions were conducted under atmospheric condition in solvents such as water, DMSO, DMF, CH<sub>3</sub>CN and 1,4-dioxane. Yields refer to spectroscopically (<sup>1</sup>H NMR) homogeneous material obtained after acid-base treatment

1  
2  
3 followed by filtration. Infrared spectra were recorded using an FT/IR spectrometer with ATR  
4 PRO450-S and the absorption is expressed in  $\text{cm}^{-1}$ .  $^1\text{H}$  NMR spectra were obtained using 500,  
5  
6 400 and 200 MHz NMR spectrometers, respectively. Chemical shifts ( $\delta$ ) are reported in parts per  
7  
8 million (ppm) downfield from tetramethylsilane and is referenced to the solvent peak:  $\text{DMSO-}d_6$   
9  
10 ( $\delta$  2.50 for  $^1\text{H}$  NMR). The number of protons ( $n$ ) for a given resonance is indicated by  $n\text{H}$ . Peak  
11  
12 multiplicities are designated by the following abbreviations: s, singlet; d, doublet; t, triplet; m,  
13  
14 multiplet; dd, doublet of doublet; td, triplet of doublet; dt, doublet of triplet; tt, triplet of triplet;  
15  
16 ddd, doublet of doublet of doublet; br, broad;  $J$ , coupling constant in Hz. High resolution mass  
17  
18 spectra were obtained by using negative electrospray ionization (ESI) by time of flight (TOF)  
19  
20 method. Melting points were recorded on a standard melting point apparatus and are uncorrected.

### 29 **General experimental procedure for the synthesis of aryl carboxylic acids:**

30  
31 A sealed tube equipped with a magnetic stirrer bar was charged with arylacetic acid **1** (1.0  
32  
33 mmol),  $\text{I}_2$  (350-755 mg, 1.5 mmol) and DMSO (3 mL). The reaction vessel was stirred at 120 °C  
34  
35 for 24-30 h. After disappearance of the reactant, monitored by TLC, the reaction mass was  
36  
37 cooled to room temperature, quenched with 10% aq.  $\text{Na}_2\text{S}_2\text{O}_3$  solution and diluted with saturated  
38  
39  $\text{NaHCO}_3$  solution. The resulting mixture was then extracted with ethyl acetate to remove organic  
40  
41 impurities. The aqueous layer was then acidified with ice cooled 2 M HCl until the reaction  
42  
43 mixture was strongly acidic by pH paper. This on simple filtration and washing with ice cooled  
44  
45 water resulted in pure benzoic acids **2a-2v**.

20 The authors declare no competing financial interest.  
21  
22  
23

## 24 **ACKNOWLEDGMENT**

25  
26  
27  
28 The financial support from the Council of Scientific and Industrial Research, New Delhi  
29  
30 (sanction no. 01(2427)/10/EMR-II dated 28/12/2010 and pool scheme no. 8644-A), India, to  
31  
32 carry out this work is gratefully acknowledged. H.P.K. and K.S.V. thank Council of Scientific  
33  
34 and Industrial Research and University Grants Commission-Special Assistance Programme, New  
35  
36 Delhi respectively for award of research fellowships. A.C.C. thanks DST for offering Fast Track  
37  
38 Project SB/FT/CS-147/2013. The authors thank Prof. Prakash M. Bhate and Prof. A. K.  
39  
40 Srivastava for their generous support.  
41  
42  
43  
44

## 45 **Supporting Information**

46  
47  $^1H$  and  $^{13}C$  NMR spectra of all aryl carboxylic acids. This material is available free of charge *via*
