## Abstract

Porcine liver esterase (PLE)- or rabbit liver esterase (RLE)-catalyzed hydrolysis of the pro-S ester group of diethyl  $\alpha$ -alkyl- $\alpha$ -(benzyloxycarbonylamino)malonates **2a**-c afforded (*R*)-ethyl  $\alpha$ -alkyl- $\alpha$ -(benzyloxycarbonylamino)malonates **3a**-c each in excellent enantiomeric excess. Enantiodivergent reductions of these acid esters **3a**-c readily furnished both the corresponding enantiomeric  $\alpha$ -substituted serines (*R*)- and (*S*)-**5a**-c. © 1998 Elsevier Science Ltd. Keywords: amino acids and derivatives; asymmetric synthesis; enzymes and enzyme reactions; reduction

 $\alpha$ -Substituted  $\alpha$ -amino acids moieties have been found in natural products, and a number of synthetic methods for them have been developed.<sup>1</sup> Particularly, the synthesis of  $\alpha$ -substituted serines has been of major interest in recent years. Natural products such as ISP-I,<sup>2,3</sup> (+)-lactacystin,<sup>4,5</sup> and (+)-conagenin<sup>6,7</sup> bearing the chiral  $\alpha$ -substituted serine moiety have attracted our attention because of their biological activities. As part of our own contribution to this area, we achieved an asymmetric total synthesis of ISP-I (a potent immunosuppressive principle in the *Isaria sinclairii* metabolite) in 1995.<sup>8,9</sup>

Herein we wish to describe a new elaborated procedure for enantiodivergent construction of chiral  $\alpha$ -substituted serines as shown in Scheme 1.  $\sigma$ -Symmetric prochiral diethyl  $\alpha$ -aminomalonate 1 was protected by treatment with benzyloxycarbonyl (Z) chloride in the presence of NaHCO<sub>3</sub> in 97% yield followed by alkylation using alkyl halides and sodium hydride to afford  $\alpha$ -alkyl- $\alpha$ -(Z-amino)malonates **2a-d** in 77 - 83% yields (Scheme 2). Their enantioselective enzymatic hydrolyses with porcine liver esterase (PLE) [Sigma, suspension in 3.2 M ( $NH_4$ )<sub>2</sub>SO<sub>4</sub> solution, pH 8] or rabbit liver esterase (RLE) [Sigma, crystalline suspension in 3.2 M (NH<sub>4</sub>),SO<sub>4</sub>, 0.01 M Tris, pH 8.5] were undertaken as follows. The diesters 2a-d were dissolved in 1/15M phosphate buffer solution (pH 7.0) and MeCN (10:1). After adding enzyme (PLE or RLE), the mixture was stirred at room temperature (ca. 23 °C) for the required time. The reaction mixture was treated with 5% HCl and then extracted with AcOEt. After evaporation of the extract in vacuo, the residue was purified on a silica gel column with CH<sub>2</sub>Cl<sub>2</sub>-MeOH as the eluent to give the corresponding carboxylic acid esters **3a-c** as a colorless oil. The enantiomeric excess (ee) values of **3a-c** were determined to be 97, 95, and 90%, respectively, by exploiting HPLC equipped with a chiral column after methylation of 3a-c with diazomethane (Table 1, entries 1, 3, and 6). Unfortunately, the enzymatic hydrolysis of 2d only gave a trace amount of acid ester 3d employing PLE or RLE. All results are summarized in Table 1.

The absolute configuration of acid ester **3a** was determined to be *R* by its chemical conversion to the known compound<sup>10</sup> and in comparison of the specific rotation with the literature value<sup>10</sup> as shown in Scheme 3. Namely, reduction of **3a** with LiBH<sub>4</sub> in Et<sub>2</sub>O under reflux gave (*S*)-Z- $\alpha$ -methylserine [(*S*)-**4a**], which was submitted to hydrogenolytic debenzyloxycarbonylation to obtain (*S*)- $\alpha$ -methylserine {[ $\alpha$ ]<sub>D</sub><sup>28</sup> +5.4 (*c* 0.85, H<sub>2</sub>O), lit.<sup>10</sup> [ $\alpha$ ]<sub>D</sub><sup>22</sup> +6.5 (*c* 1.01, H<sub>2</sub>O)}, a fragment of (+)-conagenin.<sup>6.7</sup> The absolute configurations of acid esters **3b,c** were similarly determined to be *R* by their chemical conversions to the known compounds.<sup>11</sup> These enantioselectivities in the PLE-catalyzed hydrolysis may be explained in accordance with the Jones active-site model by regarding the Z-amino group as accommodating to a large hydrophobic pocket of the PLE active-site.<sup>12,13</sup>

Esterase-catalyzed hydrolysis of diethyl α-alkyl-α-(Z-amino)malonates 2a-d

Enantiodivergent transformation of (R)-**3a-c** to (R)- or (S)- $\alpha$ -alkylserine derivatives **5a-c** was performed as shown in Scheme 3.<sup>14,15</sup> Fluorination of (R)-**3a-c** [(R)-**3a**: 96% ee, (R)-**3b**: 92% ee, (R)-**3c**: 90% ee] with cyanuric fluoride<sup>16</sup> in the presence of pyridine, followed by reduction of the resultant acyl fluorides with NaBH<sub>4</sub> in THF, then addition of MeOH, gave the corresponding (R)-Z- $\alpha$ -alkylserine ethyl esters **5a-c** in 72-84% overall yields. On the other hand, reduction of (R)-**3a-c** [(R)-**3a**: 96% ee, (R)-**3b**: 92% ee, (R)-**3c**: 90% ee] with LiBH<sub>4</sub> in Et<sub>2</sub>O afforded the corresponding (S)-Z- $\alpha$ -alkylserines **4a-c** in 31-56% yields. Esterification of **4a-c** gave the (S)-Z- $\alpha$ -alkylserine ethyl esters **5a-c** in 53-74% yields, respectively. The ee values of (R)- and (S)-**5a-c** were confirmed to be almost the same as those of the corresponding acid esters (R)-**3a-c** as shown in Table 2.

Table 2

Among chiral  $\alpha$ -substituted serines 5a-c, Z- $\alpha$ -allylserine ethyl ester 5c can be useful for the further  $\alpha$ -substituted serine syntheses based on the chemical modification of the double bond. Scheme 4 illustrates a chemical conversion of (R)-5c to  $\alpha$ -substituted serine derivatives (R)-7 and (R)-8. (R)-5 c was protected by treatment with AcCl in the presence of pyridine in 88% yield. Ozonolysis with (R)-6 furnished (R)-7 (100% yield), which was submitted to the Horner-Wadsworth-Emmons reaction with methyl bis(trifluoroethyl)phosphonate to give  $\alpha,\beta$ -unsaturate esters (R)-8 in 77% yield (E : Z = 1 : 9).<sup>17</sup> Further synthetic applications of this convenient approach to various chiral  $\alpha$ substituted serines are currently being under study.
