Tokyo College of Pharmacy, Horinouchi 1432-1, Hachioji, Tokyo 192-03, Japan. Received November 19, 1992

Several aromatic ring substituent modified RA derivatives were prepared from RA-VII (1), RA-V (8) and RA-II (11), and evaluated for cytotoxicity against P388 leukemia and KB cells. In terms of IC₅₀ values, the C₆ methoxyl group of Tyr-3 greatly influenced the activities, while the substituents at the C₇ position of Tyr-6 were less important. One of the derivatives, Tyr-6-C₆-deoxyRA-V (9, P388, IC₅₀, 0.0025 µg/ml) was nearly as active as RA-VII (1, 0.0013 µg/ml), and also expressed promising anti-P388 *in vivo* activity (test/control = 171%, at 25 mg/kg).

Keywords RA-VII; cytotoxicity; antitumor activity; cyclic hexapeptide; demethoxyRA; de-*O*-methylRA

Introduction

RA series bicyclic hexapeptides originally isolated from the roots of *Rubia akane* and *R. cordifolia*²⁾ showed significant antileukemic and antitumor activities. As shown in Fig. 1, their structures are characterized by both 18- and 14-membered ring systems with unique isodityrosine structure. Their structure elucidation,³⁾ physiological activities,⁴⁾ total synthesis,⁵⁾ conformational analysis⁶⁾ and modifications on Tyr-6 aromatic ring of RA-V⁷⁾ have been reported. A report of an RA derivative lacking a diphenyl ether linkage with no antitumor activity by Bates *et al.*,⁸⁾ and recent synthetic studies of RA analogues by Boger *et al.*⁹⁾ suggested the 14-membered ring moiety to be biologically important. In view of these results, we investigated modifications on the aromatic ring of Tyr-3 and/or Tyr-6 of RAs to elucidate the minimum structure requirements in the aromatic ring moiety for their cytotoxicities and antitumor activity.

This paper describes the preparation and cytotoxic activities against P388 leukemia and KB cells of aromatic ring substituent modified RA derivatives.

Chemistry Treatment of RA-VII (1) with boron tribromide (BBr₃) in dichloromethane (CH₂Cl₂) afforded the dide-*O*-methylRA-VII (2) in 66% yield. Treatment of 2 with *N*-phenyltrifluoromethanesulfonimide (Tf₂NPh, 3 eq) in CH₂Cl₂, followed by reduction of the resulting ditriflate (3) with formic acid (HCOOH) in the presence of palladium acetate (Pd(OAc)₂)¹⁰⁾ gave didemethoxyRA-VII (4) in 88% (from 2) yield. In order to obtain the demethoxyRA-V (7), 2 was triflated under a controlled condition with 1.5 eq of Tf₂NPh to afford the desired dide-*O*-methylRA-VII Tyr-3-*O*-triflate (5, 27% yield), along with 3 (34%), dide-*O*-methylRA-VII Tyr-6-*O*-triflate (6, 19%), and recovered 2 (20%). The triflated position was determined by a comparison of proton nuclear magnetic resonance (¹H-NMR) spectra of the products. Resonances of Tyr-3 C₆ protons of 5 were shifted downfield by *ca.* 0.4 ppm relative to those of 2 and 6 due to deshielding effect of the triflate group, with no significant change in resonances of Tyr-6 aromatic protons. Reduction of 5 with HCOOH–Pd(OAc)₂ system furnished demethoxyRA-V (7) in 72% yield.

a) $\text{CD}_3\text{OD}-\text{CDCl}_3$ (3:1).

A similar scheme was also applied for the preparation of Tyr-6-C $_{\zeta}$ -deoxyRA-V (9) and demethoxyRA-II (10) starting from RA-V (8), and of Tyr-3-C $_{\zeta}$ -deoxyRA-II (12) from RA-II (11). Deoxygenation of aromatic ring was confirmed by mass and NMR spectroscopy, and the appearance of an additional aromatic proton resonance and the upfield (*ca.* 20–30 ppm) of deoxygenated C $_{\zeta}$ resonance in ^{13}C -NMR spectrum were especially characteristic (Table I).

Biological Results and Discussion

The results of the cytotoxic activities of the prepared RA derivatives against P388 leukemia and KB cells are shown in Table II. Standard reference antitumor agent RA-VII (1) was included in each experimental run for purposes of comparison. Clear structure–activity relationships were observed in terms of IC $_{50}$ values. In the Tyr-3 aromatic ring modified derivatives, the difference of the substituents considerably affected the IC $_{50}$ values. Tyr-6-C $_{\zeta}$ -deoxyRA-V (9) lacking the Tyr-6 C $_{\zeta}$ oxygen function was nearly as effective as RA-VII (1), while demethoxyRA-II (10), in

which the methoxyl group of 9 was replaced by hydroxyl group, was inactive, and didemethoxyRA-VII (4), the corresponding demethoxyl derivative of 9 was much less potent than 9.

On the other hand, a series of Tyr-6 modified derivatives 4, 7 and 12, which corresponded to the analogues in which each Tyr-3 unit was replaced by phenylalanine, showed weak activity. Another series of Tyr-6 modified derivatives RA-VII (1), RA-V (8) and 9, possessing methoxyl group at Tyr-3 C $_{\zeta}$ position, retained high activity.

Tyr-6-C $_{\zeta}$ -deoxyRA-V (9) which expressed the most promising cytotoxicity among the derivatives prepared in this work was evaluated against P388 leukemia in mice (Table III). The *in vivo* antileukemic activity of 9 was rather weak compared to that of RA-VII (1), however the maximum test/control (T/C) value was superior. The less toxic property of 9 might offer a helpful suggestion on designing more promising RA derivatives as antitumor drugs.

Based on these results and the previous study⁷⁾ which showed several Tyr-6-O-alkylated RA-V derivatives expressing high cytotoxic activity, the following conclusion can be postulated. It is notable that the methoxyl group at Tyr-3 C $_{\zeta}$ position greatly enhanced the cytotoxicities, and the hydroxyl group profoundly reduced them compared with derivatives having no methoxyl or hydroxyl group at the same position, while the substituent at Tyr-6 C $_{\zeta}$ position little affected the activities. Furthermore, the observation that any series of derivatives having the same functions at the Tyr-3 C $_{\zeta}$ position showed a similar degree of activity in each group might suggest that the Tyr-3 portion participates in the cytotoxic effects.

Experimental

Melting points were determined on a Yanagimoto micro-melting point apparatus and are uncorrected. Infrared (IR) spectra were taken on a Perkin Elmer 1710 spectrometer. Optical rotations were measured with a

JASCO DIP-4 automatic digital polarimeter, $[\alpha]_D$ values are given in 10^{-1} deg $\cdot$ cm 2 g $^{-1}$. The proton and carbon nuclear magnetic resonance spectra were recorded on a Bruker AM-400 spectrometer. Chemical shifts were expressed in ppm with tetramethylsilane as an internal standard. The mass spectra (MS) were taken with a Hitachi M-80 and a VG AutoSpec spectrometer. The ultraviolet (UV) and visible absorption spectra were recorded on a Shimadzu UV-240 spectrophotometer. Silica gel column chromatography was performed with a CIG column system (22 i.d. $\times$ 100 mm, Kusano Scientific Co., Tokyo) prepacked with 10 μ silica gel.

Dide-O-methylRA-V (2) BBr $_3$ (1.0 M in CH $_2$ Cl $_2$, 2.5 ml, 2.5 mmol) was dropped to a solution of **1** (385.4 mg, 0.50 mmol) in CH $_2$ Cl $_2$ (10 ml) at -78°C . After stirring at room temperature for 24 h, the mixture was diluted with CH $_2$ Cl $_2$, washed successively with H $_2$ O, 1 N HCl, sat. NaHCO $_3$ and brine, and dried. The solvent was evaporated off *in vacuo* to leave a residue, which was chromatographed on silica gel eluting with CH $_2$ Cl $_2$ -AcOEt-MeOH (15:2:1), followed by recrystallization from MeOH-isopropyl ether to give **2** (244.5 mg, 66%) as a colorless powder, mp 264°C (dec.), $[\alpha]_D -189.3^\circ$ ($c=0.15$, MeOH). IR ν (CHCl $_3$): 3399, 1673 cm $^{-1}$. UV $\lambda_{\text{max}}^{\text{EtOH}}$ nm (log ϵ): 220 (4.49), 278 (3.66). High-resolution FAB-MS Calcd for C $_{39}$ H $_{47}$ N $_6$ O $_8$: 743.3405 [M+H] $^+$. Found: 743.3388. DemethoxyRA-V (7) A mixture of **2** (14.6 mg, 0.020 mmol), Tf $_2$ NPh (10.7 mg, 0.030 mmol), Et $_3$ N (5 μ l, 0.036 mmol) and dry CH $_2$ Cl $_2$ (2 ml) was stirred at room temperature for 72 h. The reaction mixture was diluted with CH $_2$ Cl $_2$, washed successively with H $_2$ O, 1 N HCl and brine, and dried. The solvent was evaporated off *in vacuo* to leave a residue, which was chromatographed on silica gel eluting with CH $_2$ Cl $_2$ -AcOEt-MeOH (15:2:1) to give **3** (7.0 mg, 34%), **5** (4.8 mg, 27%), and **6** (3.2 mg, 19%) together with recovered **2** (3.0 mg, 20%). **5**: an amorphous powder. IR ν (CHCl $_3$): 3425, 1675, 1145 cm $^{-1}$. CI-MS m/z (%): 875 (20, M+1 $^+$), 119 (100). $^1\text{H-NMR}$ (CDCl $_3$, major conformer) δ : Tyr-3 [3.45 (1H, dd, $J=14.0$, 10.5 Hz, H $_{\beta a}$), 3.52 (1H, dd, $J=14.0$, 5.0 Hz, H $_{\beta b}$), 3.62 (1H, dd, $J=10.5$, 5.0 Hz, H $_{\alpha}$), 7.23–7.24 (4H, m, H $_{\beta}$ and H $_{\alpha}$)].

A mixture of **5** (4.8 mg, 0.0054 mmol), Pd(OAc) $_2$ (0.9 mg, 0.0040 mmol), 1,1'-bis(diphenylphosphino)ferrocene (4.4 mg, 0.0080 mmol), Et $_3$ N (8.4 μ l, 0.062 mmol), HCOOH (1.5 μ l, 0.033 mmol) and DMF (1 ml) was stirred for 72 h at 60°C . The mixture was concentrated *in vacuo*, and the residue was diluted with CH $_2$ Cl $_2$, and washed successively with H $_2$ O, 1 N HCl and brine, and dried. The solvent was evaporated off *in vacuo* to leave a residue, which was chromatographed on silica gel eluting with CH $_2$ Cl $_2$ -AcOEt-MeOH (15:2:1), followed by recrystallization from MeOH-isopropyl ether to give **7** (2.9 mg, 72%) as a colorless powder, mp $246-247^\circ\text{C}$, $[\alpha]_D -198.3^\circ$ ($c=0.11$, CHCl $_3$). IR ν (CHCl $_3$): 3397, 1673 cm $^{-1}$. UV $\lambda_{\text{max}}^{\text{EtOH}}$ nm (log ϵ): 280 (3.59), 288 (3.55). High-resolution FAB-MS Calcd for C $_{39}$ H $_{47}$ N $_6$ O $_8$: 727.3455 [M+H] $^+$. Found: 727.3495. MS m/z (%): 726 (10, M $^+$), 119 (100). $^1\text{H-NMR}$ (CDCl $_3$, major conformer) δ : 1.11 (3H, d, $J=6.7$ Hz, Ala-4-H $_{\beta}$), 1.30 (3H, d, $J=6.9$ Hz, Ala-1-H $_{\beta}$), 1.35 (3H, d, $J=6.9$ Hz, Ala-2-H $_{\beta}$), 2.63 (1H, dd, $J=11.3$, 3.0 Hz, Tyr-5-H $_{\beta a}$), 2.69 (3H, s, Tyr-6-NMe), 2.83 (3H, s, Tyr-3-NMe), 2.90 (1H, m, Tyr-6-H $_{\beta a}$), 3.04 (1H, m, Tyr-6-H $_{\beta b}$), 3.11 (3H, s, Tyr-5-NMe), 3.40 (1H, dd, $J=13.9$, 10.8 Hz, Tyr-3-H $_{\beta a}$), 3.46 (1H, dd, $J=13.9$, 5.0 Hz, Tyr-3-H $_{\beta b}$), 3.63 (1H, dd, $J=10.8$, 5.0 Hz, Tyr-3-H $_{\alpha}$), 3.69 (1H, t, $J=11.3$ Hz, Tyr-5-H $_{\beta b}$), 4.35 (1H, d, $J=2.0$ Hz, Tyr-6-H $_{\alpha}$), 4.37 (1H, qd, $J=6.9$, 6.8 Hz, Ala-1-H $_{\alpha}$), 4.54 (1H, dd, $J=11.8$, 4.0 Hz, Tyr-6-H $_{\alpha}$), 4.76 (1H, dq, $J=7.7$, 6.7 Hz, Ala-4-H $_{\alpha}$), 4.82 (1H, dq, $J=8.4$, 6.9 Hz, Ala-2-H $_{\alpha}$), 5.41 (1H, dd, $J=11.3$, 3.0 Hz, Tyr-5-H $_{\alpha}$), 6.38 (1H, d, $J=8.4$ Hz, Ala-2-NH), 6.44 (1H, d, $J=6.8$ Hz, Tyr-6-NH), 6.51 (1H, dd, $J=8.3$, 2.0 Hz, Tyr-6-H $_{\beta b}$), 6.72 (1H, d, $J=7.7$ Hz, Ala-4-NH), 6.81 (1H, d, $J=8.3$ Hz, Tyr-6-H $_{\alpha}$), 6.84 (1H, dd, $J=8.4$, 2.4 Hz, Tyr-5-H $_{\alpha}$), 7.13–7.15 (2H, m, Tyr-3-Ar-H), 7.20 (1H, dd, $J=8.4$, 2.4 Hz, Tyr-5-H $_{\beta b}$), 7.23–7.32 (4H, m, Tyr-3-Ar-H and Tyr-5-H $_{\alpha}$), 7.42 (1H, dd, $J=8.4$, 2.2 Hz, Tyr-5-H $_{\beta b}$).

Tyr-6-C $_2$ -deoxyRA-V (9) This compound was prepared from **8** in a similar manner to that described for **4** in 79% yield as a colorless powder, mp $>300^\circ\text{C}$ (MeOH-isopropyl ether), $[\alpha]_D -215.8^\circ$ ($c=0.20$, CHCl $_3$). IR ν (CHCl $_3$): 3425, 1675 cm $^{-1}$. UV $\lambda_{\text{max}}^{\text{EtOH}}$ nm (log ϵ): 223 (4.34), 272 (3.46), 279 (3.46). High-resolution MS Calcd for C $_{40}$ H $_{48}$ N $_6$ O $_8$: 740.3534. Found: 740.3537. MS m/z (%): 740 (20, M $^+$), 164 (100). $^1\text{H-NMR}$ (CDCl $_3$, major conformer) δ : 1.11 (3H, d, $J=6.7$ Hz, Ala-4-H $_{\beta}$), 1.30 (3H, d, $J=6.9$ Hz, Ala-1-H $_{\beta}$), 1.35 (3H, d, $J=6.9$ Hz, Ala-2-H $_{\beta}$), 2.64 (1H, dd, $J=11.3$, 2.8 Hz, Tyr-5-H $_{\beta a}$), 2.69 (3H, s, Tyr-6-NMe), 2.86 (3H, s, Tyr-3-NMe), 2.99 (1H, dd, $J=18.3$, 3.7 Hz, Tyr-6-H $_{\beta a}$), 3.12 (3H, s, Tyr-5-NMe), 3.13 (1H, dd, $J=18.3$, 11.9 Hz, Tyr-6-H $_{\beta b}$), 3.33 (1H, dd, $J=13.8$, 10.6 Hz, Tyr-3-H $_{\beta a}$), 3.37 (1H, dd, $J=13.8$, 5.1 Hz, Tyr-3-H $_{\beta b}$), 3.58 (1H, dd, $J=10.6$, 5.1 Hz, Tyr-3-H $_{\alpha}$), 3.67 (1H, t, $J=11.3$ Hz, Tyr-5-H $_{\beta b}$), 3.79 (3H, s, Tyr-3-OMe), 4.33 (1H, brs, Tyr-6-H $_{\alpha}$), 4.37 (1H, qd, $J=6.9$, 6.8 Hz, Ala-1-H $_{\alpha}$), 4.58 (1H, dd, $J=11.9$, 3.7 Hz, Tyr-6-H $_{\alpha}$), 4.76 (1H, dq, $J=7.7$, 6.7 Hz, Ala-4-H $_{\alpha}$), 4.84 (1H, dq, $J=8.3$, 6.9 Hz, Ala-2-H $_{\alpha}$), 5.42 (1H, dd, $J=11.3$, 2.8 Hz, Tyr-5-H $_{\alpha}$), 6.44 (1H, d, $J=8.3$ Hz, Ala-2-NH), 6.46 (1H, d, $J=6.8$ Hz, Ala-1-NH), 6.61 (1H, d, $J=7.6$ Hz, Tyr-6-H $_{\alpha}$), 6.72 (1H, d, $J=7.7$ Hz, Ala-4-NH), 6.83 (2H, d, $J=8.6$ Hz, Tyr-3-H $_{\beta}$), 6.84 (1H, d, $J=7.6$ Hz, Tyr-6-H $_{\beta b}$), 6.97 (1H, dd, $J=8.4$, 2.3 Hz, Tyr-5-H $_{\alpha}$), 7.04 (2H, d, $J=8.6$ Hz, Tyr-3-H $_{\beta}$), 7.14 (1H, t, $J=7.6$ Hz, Tyr-6-H $_{\alpha}$), 7.17 (1H, dd, $J=8.4$, 2.3 Hz, Tyr-5-H $_{\beta b}$), 7.26 (1H, dd, $J=8.4$, 2.2 Hz, Tyr-5-H $_{\beta a}$), 7.42 (1H, dd, $J=8.4$, 2.2 Hz, Tyr-5-H $_{\beta b}$).

DemethoxyRA-II (10) This compound was prepared from **9** in a similar manner to that described for **2** in 55% yield. A colorless powder, mp $258-259^\circ\text{C}$ (MeOH), $[\alpha]_D -118.9^\circ$ ($c=0.17$, CHCl $_3$). IR ν (CHCl $_3$): 3390, 1668 cm $^{-1}$. UV $\lambda_{\text{max}}^{\text{EtOH}}$ nm (log ϵ): 225 (4.37), 273 (3.51), 279 (3.55). High-resolution FAB-MS Calcd for C $_{39}$ H $_{47}$ N $_6$ O $_8$: 727.3455 [M+H] $^+$. Found: 727.3483. MS m/z (%): 726 (10, M $^+$), 119 (100). $^1\text{H-NMR}$ (CDCl $_3$, major conformer) δ : 1.09 (3H, d, $J=6.6$ Hz, Ala-4-H $_{\beta}$), 1.31 (3H, d,

$J=7.0$ Hz, Ala-1- H_β), 1.33 (3H, d, $J=7.0$ Hz, Ala-2- H_β), 2.64 (1H, dd, $J=11.3$, 3.5 Hz, Tyr-5- $H_{\beta a}$), 2.70 (3H, s, Tyr-6-NMe), 2.87 (3H, s, Tyr-3-NMe), 2.99 (1H, dd, $J=18.3$, 3.5 Hz, Tyr-6- $H_{\beta a}$), 3.10 (3H, s, Tyr-5-NMe), 3.15 (1H, dd, $J=18.3$, 11.8 Hz, Tyr-6- $H_{\beta b}$), 3.32 (1H, dd, $J=14.1$, 10.0 Hz, Tyr-3- $H_{\beta a}$), 3.36 (1H, dd, $J=14.1$, 5.4 Hz, Tyr-3- $H_{\beta 2}$), 3.59 (1H, dd, $J=10.0$, 5.4 Hz, Tyr-3- H_α), 3.67 (1H, t, $J=11.3$ Hz, Tyr-5- $H_{\beta b}$), 4.34 (1H, brs, Tyr-6- $H_{\beta a}$), 4.39 (1H, dq, $J=8.1$, 7.0 Hz, Ala-1- H_α), 4.59 (1H, dd, $J=11.8$, 3.5 Hz, Tyr-6- H_α), 4.75 (1H, dq, $J=8.3$, 6.6 Hz, Ala-4- H_α), 4.82 (1H, qd, $J=7.0$, 6.7 Hz, Ala-2- H_α), 5.42 (1H, dd, $J=11.3$, 3.5 Hz, Tyr-5- H_α), 6.51 (1H, d, $J=6.7$ Hz, Ala-2-NH), 6.61 (1H, d, $J=7.6$ Hz, Tyr-6- H_α), 6.65 (1H, d, $J=8.1$ Hz, Ala-1-NH), 6.76 (1H, d, $J=7.6$ Hz, Tyr-6- $H_{\beta b}$), 6.79 (2H, d, $J=8.3$ Hz, Tyr-3- H_α), 6.83 (1H, dd, $J=8.3$, 2.3 Hz, Tyr-5- $H_{\beta a}$), 6.97 (3H, d, $J=8.3$ Hz, Ala-4-NH and Tyr-3- H_β), 7.13 (1H, t, $J=7.6$ Hz, Tyr-6- $H_{\beta a}$), 7.17 (1H, dd, $J=8.4$, 2.3 Hz, Tyr-5- $H_{\beta b}$), 7.24 (1H, dd, $J=8.3$, 2.1 Hz, Tyr-5- $H_{\beta a}$), 7.41 (1H, dd, $J=8.4$, 2.1 Hz, Tyr-5- $H_{\beta b}$).

Tyr-3- C_α -deoxyRA-II (12) This compound was prepared from **11** in a similar manner to that described for **4** in 60% yield. A colorless powder, mp 242–243 °C (MeOH). $[\alpha]_D^{25} -171.4^\circ$ ($c=0.14$, $CHCl_3$). IR ν ($CHCl_3$): 3425, 1675 cm^{-1} . UV λ_{max}^{EtOH} nm (log ϵ): 224 (4.59), 293 (4.29). High-resolution FAB-MS Calcd for $C_{40}H_{49}N_6O_8$: 741.3612 $[M+H]^+$. Found: 741.3589. MS m/z (%): 740 (10, M^+), 134 (100). 1H -NMR ($CDCl_3$, major conformer) δ : 1.13 (3H, d, $J=6.7$ Hz, Ala-4- H_β), 1.30 (3H, d, $J=6.9$ Hz, Ala-1- H_β), 1.35 (3H, d, $J=6.9$ Hz, Ala-2- H_β), 2.64 (1H, dd, $J=11.4$, 3.1 Hz, Tyr-5- $H_{\beta a}$), 2.69 (3H, s, Tyr-6-NMe), 2.82 (3H, s, Tyr-3-NMe), 2.95 (1H, dd, $J=18.3$, 3.7 Hz, Tyr-6- $H_{\beta a}$), 3.10 (1H, dd, $J=18.3$, 11.9 Hz, Tyr-6- $H_{\beta b}$), 3.13 (3H, s, Tyr-5-NMe), 3.40 (1H, dd, $J=13.9$, 10.9 Hz, Tyr-3- $H_{\beta a}$), 3.46 (1H, dd, $J=13.9$, 4.9 Hz, Tyr-3- $H_{\beta b}$), 3.63 (1H, t, $J=11.4$ Hz, Tyr-5- $H_{\beta b}$), 3.63 (1H, dd, $J=10.9$, 4.9 Hz, Tyr-3- H_α), 3.93 (3H, s, Tyr-6-OMe), 4.32–4.39 (1H, m, Ala-1- H_α), 4.35 (1H, d, $J=2.0$ Hz, Tyr-6- $H_{\beta a}$), 4.54 (1H, dd, $J=11.9$, 3.7 Hz, Tyr-6- H_α), 4.75 (1H, dq, $J=7.6$, 6.7 Hz, Ala-4- H_α), 4.84 (1H, dq, $J=8.5$, 6.9 Hz, Ala-2- H_α), 5.42 (1H, dd, $J=11.4$, 3.1 Hz, Tyr-5- H_α), 6.19 (1H, d, $J=8.5$ Hz, Ala-2-NH), 6.42 (1H, d, $J=6.7$ Hz, Ala-1-NH), 6.57 (1H, dd, $J=8.3$, 2.0 Hz, Tyr-6- $H_{\beta b}$), 6.69 (1H, d, $J=7.6$ Hz, Ala-4-NH), 6.80 (1H, d, $J=8.3$ Hz, Tyr-6- $H_{\beta a}$), 6.87 (1H, dd, $J=8.4$, 2.4 Hz, Tyr-5- $H_{\beta a}$), 7.12–7.15 (2H, m, Tyr-3-Ar-H), 7.22 (1H, dd, $J=8.4$, 2.4 Hz, Tyr-5- $H_{\beta b}$), 7.23–7.31 (4H, m, Tyr-3-Ar-H and Tyr-5- $H_{\beta a}$), 7.42 (1H, dd, $J=8.4$, 2.2 Hz, Tyr-5- $H_{\beta b}$).

Cytotoxicity MTT (3-[4,5-dimethylthiazol-2-yl]-2,5-diphenyltetrazolium bromide) colorimetric assay was performed in a 96-well plate.¹¹⁾ The assay is dependent on the reduction of MTT by the mitochondrial dehydrogenase of viable cells to a blue formazan product which can be measured spectrophotometrically. Human KB oral epidermoid carcinoma cells (1×10^4 cells/ml) or mouse P388 leukemia cells (2×10^4 cells/ml) were inoculated in each well with 100 μ l of RPMI-1640 medium (GIBCO, Grand Island, NY) supplemented with 10% fetal calf serum (Flow Laboratories, UK), 100 units/ml of penicillin and 100 μ g/ml of streptomycin. After

overnight incubation (37 °C, 5% CO_2), 100 μ l of sample solution was added to each well and the plates were incubated for 3 d (KB cells) or 2 d (P388). Then, 50 μ l of MTT (200 μ g/ml PBS) was added to each well and the plates were incubated for a further 4 h. The resulting formazan was dissolved in 150 μ l of DMSO. The plate was placed on a plate shaker for 5 min and read immediately at 540 nm. The IC_{50} (μ g/ml) value was defined as that concentration of sample which achieved 50% reduction of growth in sample-treated cells with respect to the controls. IC_{50} was calculated by using the probit test.

Antitumor Activity P388 murine leukemia cells (1×10^6 cells) were inoculated i.p. into female CDF₁ mice (6–7 weeks old; test $n=8$, control $n=16$) on day 0. Samples, suspended in 0.5% gum arabic–saline solution, were administered i.p. on days 1–5. The antitumor activity was estimated according to the NCI tumor panel screening method.¹²⁾

Acknowledgement We are grateful to Dr. Shiro Nakaike and Dr. Masaharu Tamai of the Taisho Pharmaceutical Co., Ltd. for the biological evaluations.
