(Received February 20, 1985)

2-(2-Phenoxyphenylimino)imidazolidine and related compounds (IV and XII) were synthesized and evaluated for hypotensive activity in rats. Most of the 2-aryliminoimidazolidines (IV) were synthesized *via* the aniline derivatives (VI) by two different methods. Some imidazolidines (IV) were found to be significantly active, with 2-(5-chloro-2-phenoxyphenylimino)imidazolidine (IV-19) being more active than prazosin, the reference compound. The mechanism of action of IV-19 may involve the blockade of peripheral  $\alpha$ -adrenergic receptors.

This paper describes the synthesis, pharmacology, and structure-activity relationships of the 2-(2-phenoxyphenylimino)imidazolidines.

**Keywords**—hypotensive activity; 2-imidazoline; 2-aryliminoimidazolidine; 2-(2-phenoxyphenylimino)imidazolidine; phenoxyaniline; prazosin; structure-activity relationship

Many drugs having an imidazoline or imidazolidine moiety are known to interact with  $\alpha$ -adrenergic receptors in living systems.<sup>2-4)</sup> Of a number of imidazolines, phentolamine (I) and tolazoline (II) have found clinical uses as antagonists to peripheral  $\alpha$ -adrenergic receptors.<sup>2,5)</sup> Clonidine (III), among other imidazolidines, shows a centrally mediated hypotensive effect through its agonistic activity on the  $\alpha$ -adrenergic receptors in the medullary vasomotor center.<sup>2,3,6)</sup> A study of the quantitative structure-activity relationship for clonidine (III) and related compounds indicates that substitution, especially *ortho* substitution, on the phenyl ring plays a substantial part in determining the biological activities.<sup>7)</sup>

We have found during the last decade that in some biologically active compounds replacement of a halogen or lower alkyl group with a phenoxy group enhances the efficacy and changes the pharmacological profile. This led us to investigate some molecular alterations of clonidine (III). One of the compounds obtained was 2-(2-phenoxy-5-chlorophenylimino)imidazolidine (IV-19), which was found to have a potent hypotensive activity, with affinity for peripheral  $\alpha$ -adrenergic receptors. This article describes the chemistry and pharmacology of a number of imidazolidine derivatives (IV) illustrated in Chart 1.

Chart 1

Most of the 2-phenyliminoimidazolidines (IV) were prepared by two different methods as shown in Chart 2: one *via* thiourea derivatives (VIII) prepared from the aniline derivatives (VI) (method A),<sup>7a,8)</sup> and the other *via* a one-step reaction of VI with 2-chloro-2-imidazoline (method B).<sup>9)</sup>

Chart 2

The starting materials (V) were prepared by the reaction of substituted nitrobenzenes, which have a halogen or nitro group as a leaving group, with phenols or thiophenol under typical conditions of the Ullman reaction (method C). Those compounds (V) having an amino group such as dimethylamino-, pyrrolidino-, morpholino-, and methanesulfonylamino- were prepared as follows. 2-(4-Dimethylaminophenoxy)- and 5-dimethylamino-2-phenoxy-1-nitrobenzenes (Vd and Vk) were prepared by methylation of the corresponding amino derivatives with dimethyl sulfate. 5-(1-Pyrrolidino)-, 5-(4-morpholino)-, and 5-methanesulfonylamino-2-phenoxy-1-nitrobenzenes (Vl, Vm, and Vn) were prepared also by the reaction of the corresponding amino derivative with 1,4-ditosyloxybutane, 2,2'-ditosyloxydiethyl ether, and methanesulfonyl chloride under the conditions described in the literature.<sup>10)</sup> 5-Aminosulfonyl- and 5-dimethylaminosulfonyl-1-nitro-2-phenoxybenzenes (Vh and Vi) were synthesized *via* the corresponding sulfonyl chloride (IX), obtained by chlorination of potassium 3-nitro-4-phenoxybenzenesulfonate with phosphorus pentachloride at 120 °C. The reaction of IX with 2.4 eq of 25% aqueous dimethylamine in benzene produced Vi in 74.1% yield. Meanwhile, treatment of IX with excess 50% aqueous dimethylamine in ether afforded *N,N*-dimethyl-4-dimethylamino-3-nitrobenzenesulfonamide (X) in 82.2% yield.

Aniline derivatives (VI), one of the important key intermediates, were prepared by reduction of the corresponding nitro derivatives (V) with iron powder in the presence of ammonium chloride in aqueous ethanol (method D). 5-Hydroxy-2-phenoxyaniline (VIj) was synthesized by demethylation and simultaneous reduction of 5-methoxy-1-nitro-2-phenoxybenzene using hydroiodic acid.<sup>11)</sup>

Preparation of the thiourea function was performed by the two procedures shown in Chart 2. The aniline derivatives (VI) were allowed to react with *N*-benzoylisothiocyanate to give *N*-benzoylthiourea derivatives (VII),<sup>12)</sup> which were converted to the corresponding thioureas (VIII) by treatment with a base, such as sodium hydroxide or potassium hydroxide,

a) F, free base; FA, fumarate. b) H, *n*-hexane; IPE, diisopropyl ether; E, diethyl ether; C, chloroform; A, acetone; EA, ethyl acetate; IPA, isopropanol; Alc, ethanol; M, methanol; THF, tetrahydrofuran; DMF, *N,N*-dimethylformamide. c) See Experimental.

in methanol.<sup>12)</sup> The 5-aminosulfonylthiourea derivative (VIII-28) was prepared in a moderate yield by the one-step reaction of the corresponding aniline (VIh) with potassium thiocyanate.<sup>13)</sup>

The desired imidazolidines (IV) were synthesized by cyclization of the *S*-methylisothiuronium salts, which are the reaction products of the thioureas (VIII) and methyl iodide, using ethylenediamine (method A). The imidazolidines (IV) were also prepared by the one-step reaction of the anilines (VI) with 2-chloro-2-imidazoline (method B). For example, 2-[2-(3,4,5-trimethoxyphenoxy)phenylimino]imidazolidine (IV-15) was obtained in yields of 63.4% (method A) and 48.7% (method B). A 5-aminoimidazolidine derivative (IV-33) was prepared in 63.0% yield by catalytic reduction of the corresponding nitro derivative (IV-25) on palladium-carbon in methanol. The other imidazolidines (IV) synthesized in this study are listed in Table I.

In order to synthesize 2-(2-phenoxyphenylamino)imidazole (XII), *S*-methyl-*N*-(2-phenoxyphenyl)isothiurea hydroiodide (XI) was allowed to react with 2-aminoacetaldehyde diethylacetal, and then acid-catalized cyclization was carried out according to the method described in the literature<sup>8)</sup> (Chart 3). The product obtained was shown to consist of two different components, which were separated and purified by silica gel column chromatography. The structures of XII and XIII were identified on the basis of the elemental analysis and spectral data.

Chart 3

### Pharmacological Results

Compounds prepared were tested for hypotensive activity. Each compound was given orally to conscious normotensive rats of the Wistar strain at a dose of 10 mg/kg. Mean arterial blood pressure was measured with a pressure transducer through a polyethylene cannula inserted into a femoral artery, and recorded on a polygraph. The experiments were conducted on groups of five animals. The test results are summarized in Table II.

Compound (IV-1), which has no substituent on the benzene ring, nearly equaled prazosin in hypotensive activity. However, IV-40 and IV-41, which are isomers of IV-1 as regards the position of the phenoxy group, had no activity. Replacement of the phenoxy group of IV-1 with a phenylthio (IV-42), phenylamino (IV-43), or benzyl (IV-44) group reduced the potency. In a series of congeners substituted with a chloro or methyl on the phenoxy group of IV-1, the potency tended to decrease in the order of *ortho* (IV-2 and IV-8), *para* (IV-4 and IV-10), and *meta* (IV-3 and IV-9). Dichloro-substituted compounds (IV-5 and IV-6, and IV-7) and a naphthoxy derivative (IV-16) showed relatively weak activity. 4-Fluoro (IV-11), 4-bromo (IV-12), 4-cyano (IV-13), 4-dimethylamino (IV-14), and 3,4,5-trimethoxy (IV-15) derivatives were

TABLE II. Antihypertensive Activities of 2-Phenyliminoimidazolidines (IV) and Related Compounds in Normotensive Rats

| Compound No. | Maximum decrease in blood pressure (% of initial value) 10 mg/kg <i>p.o.</i> | Compound No. | Maximum decrease in blood pressure (% of initial value) 10 mg/kg <i>p.o.</i> |

a) IA, inactive. b) 1 mg/kg *p.o.* c) Increase in blood pressure was observed. Maximum increases were 22.4% for IV-27 and 22.8% for IV-33.

inactive. These results indicate that any substitution on the phenoxy group of IV-1 tended to decrease the potency. On the other hand, introduction of a chloro or methyl on the benzene ring of the phenylimino moiety of IV-1 enhanced the potency in some compounds. The potency was highest in IV-19 and IV-23, which have a chloro or methyl at the 5-position, and less high in compounds having the group at other positions. Unlike clonidine (III), substitution at the 6-position did not necessarily maximize the potency. Compounds having nitro (IV-25), trifluoromethyl (IV-30), and dimethylamino (IV-34) at the 5-position retained the potency of the parent compound (IV-1). Other substituents, such as cyano (IV-26), carbamoyl (IV-27), aminosulfonyl (IV-28), dimethylaminosulfonyl (IV-29), hydroxy (IV-31), methoxy (IV-32), amino (IV-33), pyrrolidino (IV-35), morpholino (IV-36), and methanesulfonylamino (IV-37), reduced the potency markedly. No clear relationship was apparent between the electronic or steric effect of the substituents and the biological potency. As expected, introduction of a chloro on the phenoxy group of IV-19 or IV-23 resulted in reduction of the potency (IV-38 and IV-39). Replacement of the imidazolidine moiety with imidazole also reduced the activity markedly (XII).

Of the compounds tested, IV-19 was found to be the most active. It appears to differ from centrally acting antihypertensive agents such as clonidine (III) in pharmacological profile. The mechanism of action of IV-19 is supposed to involve the blockade of peripheral  $\alpha$  receptors.

Compound IV-19 is now under clinical study, and details of the pharmacology will be published elsewhere.

### Experimental

The melting points were determined on a capillary melting point apparatus (Electrothermal) and are uncorrected. The infrared (IR) spectra were taken with Hitachi 215 and Hitachi 260-10 spectrometers. The proton nuclear magnetic resonance ( $^1\text{H-NMR}$ ) spectra were recorded with Varian EM-60 and JEOL MH-60 spectrometers using tetramethylsilane as an internal standard. The following abbreviations are used: s = singlet, br s = broad singlet, d = doublet, dd = double doublet, m = multiplet.

**1-Nitro-2-(3,4,5-trimethoxyphenoxy)benzene (Ve). Method C**—A mixture of 2-chloro-1-nitrobenzene (126.0 g), 3,4,5-trimethoxyphenol (162.1 g), and  $\text{K}_2\text{CO}_3$  (132.7 g) in dimethylformamide (DMF, 600 ml) was stirred under reflux for 6 h, and concentrated *in vacuo*. The residue was partitioned between  $\text{Et}_2\text{O}$  and 5% NaOH. The ether layer was washed with brine, dried, and evaporated *in vacuo*. The residue was recrystallized from MeOH to give Ve (154.1 g, 63.1%).  $^1\text{H-NMR}$  ( $\text{CDCl}_3$ )  $\delta$ : 3.84 (6H, s,  $\text{CH}_3$ ), 3.86 (3H, s,  $\text{CH}_3$ ), 6.35 (2H, s, aromatic H), 6.95–8.05 (4H, m, aromatic H).

Compounds (V) prepared by method C are listed in Table III.

**2-(4-Dimethylaminophenoxy)-1-nitrobenzene (Vd)**—The reaction of 2-(4-aminophenoxy)-1-nitrobenzene<sup>14)</sup> with dimethylsulfate, in the presence of  $\text{K}_2\text{CO}_3$  in DMF, at 100 °C for 4 h gave Vd in 33.6% yield.  $^1\text{H-NMR}$  ( $\text{CDCl}_3$ )  $\delta$ : 2.87 (6H, s,  $\text{CH}_3$ ), 6.6–7.55 (7H, m, aromatic H), 7.86 (1H, dd,  $J=8$  and 2 Hz, aromatic H).

**5-Dimethylamino-1-nitro-2-phenoxybenzene (Vk)**—The reaction of 5-amino-2-phenoxy-1-nitrobenzene ( $\text{Vo}$ )<sup>15)</sup> with dimethylsulfate in refluxing 25% NaOH for 6 h gave Vk in 31.2% yield.  $^1\text{H-NMR}$  ( $\text{CDCl}_3$ )  $\delta$ : 3.02 (6H, s,  $\text{CH}_3$ ), 6.75–7.5 (8H, m, aromatic H).

**5-Aminosulfonyl-1-nitro-2-phenoxybenzene (Vh)**—3-Nitro-4-phenoxybenzenesulfonyl chloride (IX) was prepared as follows. Potassium 3-nitro-4-phenoxybenzenesulfonate<sup>16)</sup> (10.0 g) was allowed to react with  $\text{PCl}_5$  (6.0 g) at 120 °C for 5.5 h. The resulting mixture was cooled and partitioned between benzene and cold water. The organic layer was washed with chilled water, dried, and concentrated *in vacuo* to give an oil (IX, 9.35 g, 99.4%). This oil was used without purification for the following experiment. IR  $\nu_{\text{max}}^{\text{film}} \text{cm}^{-1}$ : 1530, 1380, 1360, 1260, 1180.  $^1\text{H-NMR}$  ( $\text{CDCl}_3$ )  $\delta$ : 7.0–7.8 (6H, m, aromatic H), 8.12 (1H, dd,  $J=9$  and 2 Hz, aromatic H), 8.64 (1H, d,  $J=2$  Hz, aromatic H).

The reaction of IX with excess 14%  $\text{NH}_4\text{OH}$  in benzene at room temperature gave Vh in 57.7% yield.  $^1\text{H-NMR}$  ( $\text{DMSO}-d_6$ )  $\delta$ : 6.9–7.8 (8H, m, aromatic H and  $\text{SO}_2\text{NH}_2$ ), 8.03 (1H, dd,  $J=9$  and 2 Hz, aromatic H), 8.42 (1H, d,  $J=2$  Hz, aromatic H).

**5-Dimethylaminosulfonyl-1-nitro-2-phenoxybenzene (Vi)**—The treatment of IX with 2.4 eq of 25% aqueous dimethylamine in benzene at room temperature for 30 min gave Vi in 74.1% yield. mp 104–105 °C (lit.<sup>17)</sup> 105 °C).

**N,N-Dimethyl-4-dimethylamino-3-nitrobenzenesulfonamide (X)**—The treatment of IX with excess 50% aqueous dimethylamine in ice-cooled  $\text{Et}_2\text{O}$  for 30 min gave X in 82.2% yield. mp 102.5–104.5 °C (from *n*-hexane and EtOH, lit.<sup>18)</sup> 102–104.5 °C).

**5-(1-Pyrrolidino)-, 5-(4-Morpholino)-, and 5-Methanesulfonylamino-1-nitro-2-phenoxybenzenes (VI, Vm, and Vn)**—Vo was treated with 1,4-ditosyloxybutane, 2,2'-ditosyloxydiethylether, or methanesulfonyl chloride according to the methods described in the literature<sup>10)</sup> to give VI, Vm, or Vn in 62.4, 67.5, or 61.5% yield, respectively. VI;  $^1\text{H-NMR}$  ( $\text{CDCl}_3$ )  $\delta$ : 1.8–2.2 (4H, m,  $\text{CH}_2$ ), 3.15–3.6 (4H, m,  $\text{CH}_2$ ), 6.55–7.9 (8H, m, aromatic H). Vm;  $^1\text{H-NMR}$  ( $\text{DMSO}-d_6$ )  $\delta$ : 3.05–3.9 (8H, m,  $\text{CH}_2$ ), 6.8–7.85 (8H, m, aromatic H). Vn;  $^1\text{H-NMR}$  ( $\text{DMSO}-d_6$ )  $\delta$ : 3.07 (3H, s,  $\text{CH}_3$ ), 6.95–7.9 (8H, m, aromatic H), 10.12 (1H, br s, NH).

The other derivatives (V) were synthesized according to the literature.

**2-(3,4,5-Trimethoxyphenoxy)aniline (VIe). Method D**—Ve (29.0 g) was slowly added to a stirred mixture of iron powder (29.0 g) and  $\text{NH}_4\text{Cl}$  (3.5 g) in refluxing EtOH (493 ml) and water (87 ml), and the mixture was stirred under reflux for 45 min. After removal of the solvent, the residue was diluted with aqueous  $\text{NaHCO}_3$ , and extracted with  $\text{CH}_2\text{Cl}_2$ . This extract was dried and evaporated *in vacuo*. The residue was recrystallized from EtOH to give VIe (24.1 g, 92.2%).  $^1\text{H-NMR}$  ( $\text{CDCl}_3$ )  $\delta$ : 3.77 and 3.82 (11H, each s,  $\text{CH}_3$  and  $\text{NH}_2$ ), 6.26 (2H, s, aromatic H), 6.55–7.14 (4H, m, aromatic H).

Compounds (VI) prepared according to method D are listed in Table III.

**5-Hydroxy-2-phenoxyaniline (VIj)**—The treatment of 5-methoxy-1-nitro-2-phenoxybenzene<sup>19)</sup> with 57% aqueous HI in  $\text{Ac}_2\text{O}$  and AcOH under reflux for 3 h gave VIj in 98.1% yield.  $^1\text{H-NMR}$  ( $\text{DMSO}-d_6$ )  $\delta$ : 4.71 (2H, br s,  $\text{NH}_2$ ), 5.9–7.45 (8H, m, aromatic H), 8.90 (1H, s, OH).

The other derivatives (VI) used in this report were prepared according to the literature.

**1-Benzoyl-3-(5-chloro-2-phenoxyphenyl)thiourea (VII-19)**—Benzoyl chloride (8.86 g) was added dropwise to a hot solution of  $\text{NH}_4\text{SCN}$  (5.26 g) in dry acetone (60 ml). The mixture was refluxed for 1 h, and then 5-chloro-2-phenoxyaniline<sup>20)</sup> (13.2 g) in dry acetone (130 ml) was added dropwise. The resulting mixture was stirred under reflux for 1 h, concentrated *in vacuo*, and diluted with water. The precipitate obtained was collected, washed with water, and

a) The crude product was used for the next step without further purification. b) Yield based on the aniline derivative (VI) used.

recrystallized from acetone to give VII-19 (11.8 g, 51.4%).  $^1\text{H-NMR}$  ( $\text{CDCl}_3$ )  $\delta$ : 6.75–7.95 (12H, m, aromatic H), 8.93 (1H, d,  $J=2$  Hz, aromatic H), 9.11 (1H, br s, NH), 13.11 (1H, br s, NH).

The other compounds (VII) were prepared in a manner similar to that used for VII-19 (Table IV).

**5-Chloro-2-phenoxyphenylthiourea (VIII-19)**—A mixture of VII-19 (8.0 g) and KOH (1.17 g) in MeOH (80 ml) was stirred at 50 °C for 10 min, concentrated *in vacuo*, and diluted with water. The precipitate obtained was collected, washed with water, and recrystallized from aqueous MeOH to give VIII-19 (5.2 g, 89.3%).  $^1\text{H-NMR}$  ( $\text{DMSO}-d_6$ )  $\delta$ : 6.8–7.6 (7H, m, aromatic H), 7.78 (2H, br s,  $\text{NH}_2$ ), 8.36 (1H, d,  $J=2$  Hz, aromatic H), 9.42 (1H, br s, NH).

The other compounds (VIII) were prepared in a manner similar to that used for VIII-19 (Table IV).

**5-Aminosulfonyl-2-phenoxyphenylthiourea (VIII-28)**—VIh was treated with KSCN according to the literature.<sup>13)</sup> The crude powder obtained was purified by silica gel column chromatography using  $\text{CHCl}_3$ –AcOEt (7:3) to give VIII-28 in 58.9% yield. mp 117–120 °C (dec.) (from diisopropylether and iso-PrOH). IR  $\nu_{\text{max}}^{\text{Nujol}}$   $\text{cm}^{-1}$ : 3300, 3150, 1320, 1260, 1150.  $^1\text{H-NMR}$  ( $\text{DMSO}-d_6$ )  $\delta$ : 6.85–7.85 (11H, m, aromatic H,  $\text{SO}_2\text{NH}_2$ , and  $\text{CSNH}_2$ ), 8.60 (1H, d,  $J=2$  Hz, aromatic H), 9.48 (1H, s, NH).

**Preparation of 2-(Phenylimino)imidazolidines (IV). Method A: 2-(5-Chloro-2-phenoxyphenylimino)imidazolidine (IV-19)**—A mixture of VIII-19 (2.2 g) and  $\text{CH}_3\text{I}$  (1.34 g) in MeOH (26 ml) was stirred under reflux for 1 h, and then concentrated *in vacuo* to give *N*-(5-chloro-2-phenoxyphenyl)-*S*-methylisothiurea hydroiodide (3.3 g), which was used without purification for the following reaction. A mixture of *S*-methylisothiurea hydroiodide (3.3 g) and ethylenediamine (1.48 g) in EtOH (27 ml) was stirred under reflux for 4 h, cooled, and concentrated *in vacuo*. The resulting residue was partitioned between  $\text{CH}_2\text{Cl}_2$  and 5% NaOH, and the  $\text{CH}_2\text{Cl}_2$  layer was washed with brine, dried, and evaporated *in vacuo*. The residue was recrystallized from AcOEt–EtOH to give IV-19 (1.2 g, 52.8%).  $^1\text{H-NMR}$  ( $\text{DMSO}-d_6$ )  $\delta$ : 3.27 (4H, s,  $\text{CH}_2$ ), 6.25 (2H, br s, NH), 6.8–7.5 (8H, m, aromatic H).

**Method B: 2-[2-(3,4,5-Trimethoxyphenoxy)phenylimino]imidazolidine (IV-15)**—2-Chloro-2-imidazoline sulfate<sup>9)</sup> (1.0 g) was added to 5% NaOH (10 ml), and the solution was extracted with four 5-ml portions of  $\text{CH}_2\text{Cl}_2$ . These extracts were combined, and dried over  $\text{MgSO}_4$ .  $\text{MgSO}_4$  was removed, and VIe (0.906 g) was added to the solution. The mixture was allowed to stand at room temperature for 42 h, then filtered. This filtrate was evaporated *in vacuo*, and the residue was partitioned between AcOEt and dil. HCl. The aqueous layer was separated, washed with AcOEt, made alkaline with aqueous  $\text{Na}_2\text{CO}_3$ , and extracted with  $\text{CH}_2\text{Cl}_2$ . This extract was washed with brine, dried, and evaporated *in vacuo*. The residue was recrystallized from AcOEt–EtOH to give IV-15 (0.55 g, 48.7%).  $^1\text{H-NMR}$  ( $\text{DMSO}-d_6$ )  $\delta$ : 3.28 (4H, s,  $\text{CH}_2$ ), 3.62 (3H, s,  $\text{CH}_3$ ), 3.68 (6H, s,  $\text{CH}_3$ ), 6.10 (2H, br s, NH), 6.22 (2H, s, aromatic H), 6.8–7.25 (4H, m, aromatic H).

Compounds (IV) prepared by methods A and B are listed in Table I.

**2-(5-Amino-2-phenoxyphenylimino)imidazolidine (IV-33)**—IV-25 (3.0 g) was catalytically hydrogenated in MeOH (240 ml) at room temperature using 10% Pd on carbon. After removal of the catalyst, the solution was concentrated *in vacuo* to give a powder, which was purified by alumina column chromatography using  $\text{CHCl}_3$ –MeOH (9:1) to give IV-33 (1.7 g, 63.0%).  $^1\text{H-NMR}$  ( $\text{DMSO}-d_6$ )  $\delta$ : 3.20 (4H, s,  $\text{CH}_2$ ), 4.67 (2H, br s, NH), 5.90 (2H, br s, NH), 6.0–7.25 (8H, m, aromatic H).

**2-(2-Phenoxyphenylamino)imidazole (XII) and 2-Amino-1-(2-phenoxyphenyl)imidazole (XIII)**—A mixture of *S*-methyl-*N*-(2-phenoxyphenyl)isothiurea hydroiodide (XI, 27.2 g) and 2-aminoacetaldehyde diethylacetal (11.2 g) was stirred at 110 °C for 5.5 h, then cooled. The reaction mixture was basified with aqueous NaOH, and extracted with  $\text{CH}_2\text{Cl}_2$ . The extract was washed with brine, dried, and evaporated *in vacuo* to give a red oil (25.3 g), which was treated with conc. HCl (21.1 ml) and heated at 90 °C for 45 min. The solution was cooled, basified with aqueous NaOH, and extracted with  $\text{CH}_2\text{Cl}_2$ . The extract was washed with water, dried (treated with activated carbon), and concentrated *in vacuo*. The residue was recrystallized from *n*-hexane–AcOEt to give crystals, which were purified by silica gel column chromatography using  $\text{CHCl}_3$ –EtOH (1:1). The first eluate gave XII (0.60 g, 3.4%) as needles; mp 173–176 °C (from AcOEt–EtOH). Anal. Calcd for  $\text{C}_{15}\text{H}_{13}\text{N}_3\text{O}$ : C, 71.70; H, 5.21; N, 16.72. Found: C, 71.59; H, 5.08; N, 16.50. IR  $\nu_{\text{max}}^{\text{Nujol}}$   $\text{cm}^{-1}$ : 3390, 1600, 1580, 1245, 1210.  $^1\text{H-NMR}$  ( $\text{DMSO}-d_6$ )  $\delta$ : 6.7–7.6 (10H, m, aromatic H and imidazole H), 8.18 (1H, s, NH), 8.51 (1H, d,  $J=8$  Hz, aromatic H), 10.58 (1H, br s, NH). The subsequent eluate gave XIII (1.2 g, 6.8%) as prisms; mp 132–135 °C (from AcOEt). Anal. Calcd for  $\text{C}_{15}\text{H}_{13}\text{N}_3\text{O}$ : C, 71.70; H, 5.21; N, 16.72. Found: C, 71.51; H, 5.07; N, 16.68. IR  $\nu_{\text{max}}^{\text{Nujol}}$   $\text{cm}^{-1}$ : 3430, 3400, 3270, 1635, 1230.  $^1\text{H-NMR}$  ( $\text{DMSO}-d_6$ )  $\delta$ : 5.22 (2H, br s,  $\text{NH}_2$ ), 6.43 (1H, d,  $J=2$  Hz, imidazole H), 6.63 (1H, d,  $J=2$  Hz, imidazole H), 6.95–7.5 (9H, m, aromatic H).

**Acknowledgement** The authors are indebted to the staff members of the analytical division for elemental analyses and the measurement of spectral data.
