Abstract Ethyl 4-amino-2-fluorophenylpiperazin-1-carboxylates containing a 1,3-oxazol(idin)e, 5-thioxo-1,2,4-triazole, 1,3,4-thiadiazole, 5-thioxo-1,3,4-oxadiazole, or 1,3-thiazole nucleus were obtained starting from ethyl piperazine-1-carboxylate (**1**) by several steps. The treatment of amine, **3** or hydrazide, **9** with several aromatic aldehydes generated the corresponding arylmethyleamino (**3a–f**) or arylidenehydrazino (**12a–c**) compounds. The Mannich reaction between the 1,2,4-triazole or 1,3,4-oxadiazole compounds and 7-aca produced cephalosporanic acid derivatives. Penicillanic acid derivatives were obtained when 6-apa was used in the Mannich reactions. The synthesized compounds were screened for their antimicrobial, antilipase, and antiurease activities. Some of them were found to possess good-moderate antimicrobial activity against the test microorganisms. Two compounds exhibited antiurease activity, and four of them displayed antilipase activity.

Introduction

The limitations of the existing antibacterial drugs caused by various reasons including drug resistance, the serious side effects, and/or lack of efficacy made infectious diseases a vicious cycle. In addition, the treatment of resistant strains requires a prolonged therapy containing the use of more toxic drugs and increases the financial burden. The rising prevalence of multi-drug resistant bacteria continues to serve medicinal chemists to search and discover novel antimicrobial agents effective against pathogenic microorganisms resistant to current treatment.

Among the strategies addressed to the synthesis of compounds possessing antimicrobial activity, the syntheses of hybrid molecules incorporating different heterocyclic moieties have been attracting widespread attention (Malikarjuna *et al.*, 2009).

A number of N-containing heterocyclic compounds constitute important building blocks in organic and medicinal chemistry. For example, triazoles have been shown to possess a number of desirable activities in the context of medicinal chemistry. Ribavirin (antiviral), rizatriptan (antimigraine), alprazolam (psychotropic), fluconazole, and itraconazole (antifungal) are the best examples for potent drugs possessing triazole nucleus (Holla *et al.*, 2006; Walczak *et al.*, 2004; Jones *et al.*, 1965; Ashok *et al.*, 2007). Tazobactam, a β -lactamase inhibitor is the other best known example of triazole containing structures with the broad spectrum antibiotic piperacillin (Kategaonkar *et al.*, 2010).

Substituted piperazines constitute another class of important pharmacophores, which are found in many marketed drugs, such as the HIV protease inhibitor, Crivarin (Chaudhary *et al.*, 2006). Ciprofloxacin, norfloxacin, pefloxacin, ofloxacin, and enoxacin are fluoroquinolone

class antibacterial drugs characterized by having a piperazine moiety at C-7 of quinolone skeleton, and they have been used for the treatment of bacterial infections (Foumadi *et al.*, 2005).

The compounds having a thiazolidinone nucleus are of interest due to their broad spectrum of biological activities such as bactericidal, fungicidal, antimicrobial, antiproliferative, antiviral, anticonvulsant, anticancer, and anti-inflammatory activities (Vicini *et al.*, 2008; Wang *et al.*, 2011; Lv *et al.*, 2010; Metwally *et al.*, 2010; Balzarini *et al.*, 2009; Havrylyuk *et al.*, 2009; Subtelna *et al.*, 2010; Mushtaque *et al.*, 2012).

Mannich bases, which are known to be physiologically reactive since their basic function rendering the molecule soluble in aqueous solvents when it is transformed into aminium salt, have been reported as potential biological agents (Karthikeyan *et al.*, 2006). *N*-Mannich bases have been used successfully to obtain prodrugs of amine as well as amide-containing drugs (Zhao *et al.*, 2009). Some Mannich bases derived from 1,2,4-triazole nucleus have been reported to possess protozoicidal and antibacterial activity (Ashok *et al.*, 2007; Almajan *et al.*, 2009; Bayrak *et al.*, 2009, 2010; Demirbas *et al.*, 2009; Bektas *et al.*, 2010; Patole *et al.*, 2006).

Schiff bases have gained importance in medicinal and pharmaceutical fields due to their most versatile properties as organic synthetic intermediates and also possessing a broad range of biological activities, such as antituberculosis, anticancer, analgesic and anti-inflammatory, anticonvulsant, antibacterial, and antifungal activities (Patole *et al.*, 2006; Hearn and Cynamon, 2004; Ren *et al.*, 2002; Demirbas *et al.*, 2002; Lohray *et al.*, 2006).

We envisage that hybrid compound incorporating a 4-(2-fluorophenylene)-piperazine core with several heterocyclic moieties responsible for biological activity in a single molecular frame could lead to the novel potent antimicrobial and antiurease agents. Highly substituted piperazines can be expected to increase antimicrobial activity probably by enhancing lipophilicity of molecule.

In continuation of our research program on the synthesis of hybrid molecules containing various heterocyclic moieties, we planned the synthesis of 4-(2-fluorophenyl)piperazine derivatives along with their antimicrobial and antiurease activities.

Results and discussion

The main aim of the present study is the synthesis and antimicrobial activity evaluation of new piperazine derivatives incorporating several heterocyclic moieties including 1,3-oxadiazole, 1,2,4-triazole, 1,3-oxa(thia)zole, penicillanic acid, and/or cephalosporanic acid. Synthesis of

the intermediate and target compounds was performed according to the reactions outlined in Schemes 1, 2, and 3. The starting compound ethyl 1-piperazinecarboxylate (**1**) was provided commercially.

Ethyl 4-(4-amino-2-fluorophenyl)piperazine-1-carboxylate (**3**), that was obtained starting from compound **1** by two steps, was converted to the corresponding arylmethylenamino derivatives (**4a–f**) by the treatment with several aromatic aldehydes. In the FT-IR and ¹H NMR spectra of these compounds, no signal pointing the –NH₂ group was seen. Instead, additional signals derived from aldehyde moiety were recorded at the related chemical shift values in the ¹H NMR spectra.

The cyclocondensation of compound **5**, that was obtained from the reaction of **4** with benzylisocyanate, with ethyl bromoacetate or 4-chlorophenacyl bromide produced the corresponding hybrid molecules incorporating a 4-oxo-1,3-oxazolidine (**6**) or 4-chlorophenyl-1,3-oxazole (**7**) nucleus in the 2-fluorophenylpiperazine-1-carboxylate skeleton. The ¹H and ¹³C NMR spectra of compound **7** exhibited additional signals at aromatic region originated from 4-chlorophenyl nucleus as a result of condensation. Moreover, the elemental analyses and mass spectral data of derivatives **6** and **7** were compatible with the suggested structures.

The treatment of compound **3** with ethyl bromoacetate at room temperature in the presence of triethylamine resulted in the formation of compound **8**. When compound **8** was converted to the corresponding hydrazide (**9**) by refluxing with hydrazine hydrate, the signals originated from ester function was disappeared in the ¹H and ¹³C NMR spectra. Instead, new signals due to –NHNH₂ protons were seen at 5.93 and 9.09 ppm. Meanwhile, the stretching frequency band of this group was recorded at 3,313 cm^{–1} as a wide signal characteristic for the hydrazide structure. Compounds **6** and **7** gave mass fragmentation confirming the proposed structures.

The synthesis of compounds **10** and **11** was carried out by the treatment of compound **7** with the corresponding isothiocanates. These compounds displayed spectroscopic data and elemental analysis results consistent with the assigned structures.

The intramolecular cyclization of compound **10** generated the corresponding 1,3,4-thiazole compound (**12**) in acidic media. On the other hand, the basic treatment of compounds **10** and **11** caused to the cyclization of the (arylamino)carbonothioylhydrazino side chain leading to the formation of 5-thioxo-4,5-dihydro-1*H*-1,2,4-triazol derivatives (**13** and **14**). With the conversion of compounds **10** and **11** to compounds **12–14**, two of NH signals were disappeared in the ¹H NMR spectra. It is well-known that type of compounds can stay in thioxo or mercapto tautomeric form. In the present study, compounds **13** and **14** are

Scheme 1 i 3,4-

Di fluoronitrobenzene in ethanol, reflux for 6 h. *ii* Pd-C, hydrazine hydrate in *n*-butanol, reflux for 7 h. *iii* Indole-3-carboxaldehyde in absolute ethanol, irradiation by MW at 150 W, 110 °C for 30 min. *iv* Benzyliothiocyanate in absolute ethanol, reflux for 10 h. *v* Ethyl bromoacetate in absolute ethanol, dried sodium acetate, reflux for 13 h. *vi* 4-Chlorophenacylbromide in absolute ethanol, dried sodium acetate, reflux for 11 h

present predominately in the thioxo form as it was shown by the C=S band at 1,244–1,250 cm^{-1} in the FT-IR spectra of these compounds. Furthermore, the ^1H NMR spectra of compounds **13** and **14** revealed clearly the absence of the signal originated from SH proton, instead of that, two signals due to NH proton on 1,2,4-triazol ring was recorded at 10.45 (for **13**) or 11.27 (for **14**), that is characteristic for 4,5-dihydro-1*H*-1,2,4-triazoles.

The synthesis of Mannich bases (**15–17**) was performed by the reaction of compounds **13** and **14** with 6-aminopenicillanic acid, 6-apa (for **17**) or 7-aminocephalosporanic acid, 7-aca (for **15** and **16**) in tetrahydrofuran at room temperature in the presence of triethylamine and formaldehyde. The occurrence of the alkylaminomethylation was provided by the disappearance of signal for the proton at the *N*-1 nitrogen of the 1,2,4-triazole ring. Moreover, in ^1H

and ^{13}C NMR spectra, additional signal corresponding to the 6-apa or 7-aca-ammonium salt was recorded at the related chemical shift value.

The conversion of arylcarbonothioylhydrazino side change to 4-chlorophenyl-3-phenyl-1,3-thiazole ring (**18**) was accomplished with the treatment of 4-chlorophenacyl bromide. This compound was characterized by spectroscopic techniques including ^1H NMR, ^{13}C NMR, FT-IR, EI-MS, and elemental analysis.

The synthesis of ethyl arylidenehydrazino-piperazine-1-carboxylate derivatives (**19a–c**) was performed by microwave irradiation of compound **9** with several aromatic aldehydes namely 3-hydroxy-4-methoxybenzaldehyde, pyridine-4-carbaldehyde, and 2-hydroxybenzaldehyde. In the FT-IR spectra of these arylidenehydrazino compounds, absorption bands characteristic for NH groups were visible in

the ranges of 3,357–3,181 cm⁻¹. Another piece of evidence for condensation was the appearance of a signal as singlet integrating for one proton in the ¹H NMR spectra, which

corresponds to the N=CH proton of azomethyne group. Moreover, these compounds gave mass fragmentation and elemental analysis confirming the proposed structures.

Ethyl 4-(2-fluoro-4-[(5-thioxo-4,5-dihydro-1,3,4-oxadiazol-2-yl)methyl]amino} phenyl)piperazine-1-carboxylate (**20**) was prepared from the reaction of compound **9** with CS₂ in the basic media. The attempts for aminoalkylations of compound (**20**) by Mannich reaction allowed the isolation of the corresponding products (**21** and **22**) after 4 (for **21**) or 6 h (for **22**) at room temperature. This idea originated from the intent to introduce the penicillanic acid or cephalosporanic acid nucleus to (piperazin-1-yl)-2-thioxo-1,3,4-oxadiazole skeleton. As different from **20**, the NMR spectra of the obtained Mannich bases (**21** and **22**) displayed additional signals derived from penicillanic- or cephalosporanic-acid moiety and –CH₂– linkage at the related shift and integral values as D₂O nonexchangeable signals.

Among the synthesized compounds ethyl 4-(2-fluoro-4-nitrophenyl)piperazine-1-carboxylate (**2**) exhibited

activity on *Bacillus cereus* (Bc), that is Gram positive spore bacillus. With the reduction of nitro group of **2** to amine (compound **3**), additional activities towards *Staphylococcus aureus* (Sa), that is Gram positive coccus, *Candida albicans* (Ca), and *Saccharomyces cerevisiae* (Sc), which are yeast like fungi. For the imine compounds (**4a–f**), the highest activity was observed against *Mycobacterium smegmatis* (Ms) that is an atypical tuberculosis factor leading mortality, with the inhibition zone varying between 10 and 25 mm. The compounds containing 1,2,4-triazole and cephalosporanic- or penicillanic-acid moiety (compounds **15–17**) displayed good-moderate activity on some of the test microorganisms. The highest activity was observed for compound **17** on Bc with the inhibition zone of 16 mm. This result is better than standard drug ampicillin. Other compounds containing penicillanic acid or cephalosporanic acid core

(**21** and **22**) displayed good-moderate activity against the test microorganisms.

The synthesized compounds were assayed for their in vitro urease inhibitory activity against Jack bean urease. Two of those compounds showed perfect urease inhibition. No inhibitory effect was detected for other compounds. Thiourea with IC_{50} value $54.56 \pm 4.17 \mu\text{g mL}^{-1}$ was used as standard inhibitor. Among tested compounds, compound **15** was found to be the best inhibitory effect against urease with an IC_{50} value of $4.67 \pm 0.53 \mu\text{g mL}^{-1}$. At the various final concentrations the compound **15** showed more inhibitory effect than standard urease inhibitor thiourea. Also, compound **17** has the highest inhibitory activity than thiourea. These compounds might be considered as potential antibiotics to treat infections.

All compounds were evaluated with regard to pancreatic lipase activity and compounds **12**, **13**, **14**, and **15**, which are 1,3,4-thiadizole or 1,2,4-triazole derivatives including also 4-fluorophenylpiperazine nucleus, showed moderate anti-lipase activities at final concentration of $6.25 \mu\text{g mL}^{-1}$. No inhibitory effect was detected for other compounds. Orlistat, known pancreatic lipase inhibitor used as anti-obesity drug, showed inhibitory effect by 99 % at the same concentration.

Conclusion

This study reports microwave-assisted synthesis of some new hybrid molecules containing penicillanic acid or cephalosporanic acid moieties with some other pharmacophore heterocycles in a single structure. Hence herein we combined all these potential chemotherapeutic units, namely 1,2,4-triazole, 1,3-thiazole, 1,3-oxazole, 1,3,4-oxadiazole, piperazine, penicillanic acid, cephalosporanic acid moieties. The antimicrobial, anti-urease, and antilipase screening studies were also performed in the study.

Among the synthesized compounds, the compounds containing 1,2,4-triazole and cephalosporanic- or penicillanic-acid moiety (**15–17**) displayed good-moderate activity on some of the test microorganisms. The highest activity was observed for compound **17** on Bc with the inhibition zone of 16 mm. This result is better than standard drug ampicillin. Moreover, compounds **15** and **17** exhibited an inhibitory effect against urease. Other compounds containing penicillanic acid or cephalosporanic acid core (**21** and **22**) displayed good-moderate activity against the test microorganisms. Furthermore, compounds **12**, **13**, **14**, and **15**, which are 1,3,4-thiadizole or 1,2,4-triazole derivatives including also 4-fluorophenylpiperazine nucleus, showed moderate anti-lipase activities at final concentration of $6.25 \mu\text{g mL}^{-1}$.

Experimental

Chemistry

General information for chemicals

All the chemicals were purchased from Fluka Chemie AG Buchs (Switzerland) and used without further purification. Melting points of the synthesized compounds were determined in open capillaries on a Büchi B-540 melting point apparatus and are uncorrected. Reactions were monitored by thin-layer chromatography (TLC) on silica gel 60 F254 aluminum sheets. The mobile phase was ethyl acetate:diethyl ether, 1:1, and detection was made using UV light. FT-IR spectra were recorded as potassium bromide pellets using a Perkin Elmer 1600 series FT-IR spectrometer. ^1H NMR and ^{13}C NMR spectra were registered in DMSO- d_6 on a BRUKER AVANCE II 400 MHz NMR Spectrometer (400.13 MHz for ^1H and 100.62 MHz for ^{13}C). The chemical shifts are given in ppm relative to Me_4Si as an internal reference, J values are given in Hz. The elemental analysis was performed on a Costech Elemental Combustion System CHNS-O elemental analyzer. All the compounds gave C, H, and N analysis within ± 0.4 % of the theoretical values. The mass spectra were obtained on a Quattro LC-MS (70 eV) instrument.

Ethyl 4-(2-fluoro-4-nitrophenyl)piperazine-1-carboxylate (2) The solution of 3,4-difluoronitrobenzene (10 mmol) in excess amount of ethyl 1-piperazinecarboxylate (40 mmol) was allowed to reflux for 6 h (the progress of the reaction was monitored by TLC). Then, the mixture was poured into ice-water. The precipitated product was filtered off and recrystallized from ethanol. Yield 97 %, m. p: 90–93 °C. FT-IR (KBr, ν , cm^{-1}): 3099 (ar-CH), 1509, and 1354 (NO_2). Elemental analysis for $\text{C}_{13}\text{H}_{16}\text{FN}_3\text{O}_4$ calculated (%): C, 52.52; H, 5.42; N, 14.13. Found (%): C, 52.64; H, 5.70; N, 14.00. ^1H NMR (DMSO- d_6 , δ ppm): 1.19 (t, 3H, CH_3 , $J = 7.0$ Hz), 3.26 (s, 4H, 2CH_2), 3.51 (s, 4H, 2CH_2), 4.06 (q, 2H, CH_2 , $J = 6.6$ Hz), 7.16 (t, 1H, arH, $J = 7.8$ Hz), 8.00 (d, 2H, arH, $J = 7.8$ Hz). ^{13}C NMR (DMSO- d_6 , δ ppm): 11.47 (CH_3), 40.46 (2CH_2), 45.81 (2CH_2), 57.92 (CH_2), arC: [105.00 (CH), 109.09 (d, CH, $J_{\text{C-F}} = 26.0$ Hz), 116.54 (d, CH, $J_{\text{C-F}} = 154.0$ Hz), 136.43 (C), 142.01 (C), 146.05 (C)], 151.46 (C=O). Antimicrobial activity assessment

All bacterial and yeast strains were obtained from the Hizissihha Institute of Refik Saydam (Ankara, Turkey) and were as follows: *Pseudomonas aeruginosa* ATCC 27853, *Enterococcus faecalis* ATCC 29212, *S. aureus* ATCC 25923, *B. cereus* 709 ROMA, Ms: *M. smegmatis* ATCC607, *C. albicans* ATCC 60193, Sc: *S. cerevisiae* RSKK 251. All the newly synthesized compounds were dissolved in dimethyl sulfoxide (DMSO) and ethanol to prepare chemicals of stock solution of 10 mg mL⁻¹.

Agar-well diffusion method

Simple susceptibility screening test using agar-well diffusion method as adapted earlier (Ahmad *et al.*, 1998) was used. Each microorganism was suspended in Mueller–Hinton (MH) (Difco, Detroit, MI, USA) broth and diluted approximately to 106 colony forming unit (cfu) mL⁻¹. They were “flood-inoculated” onto the surface of MH agar and Sabouraud dextrose agar (SDA) (Difco, Detroit, MI, USA) and then dried. For *C. albicans* and *C. tropicalis*, SDA were used. Five-millimeter diameter wells were cut from the agar using a sterile cork-borer, and 50 mL of the extract substances was delivered into the wells. The plates were incubated for 18 h at 35 °C. Antimicrobial activity was evaluated by measuring the zone of inhibition against the test organism. Ampicillin (10 mg) and Fluconazole (5 mg) were used as standard drugs. Dimethyl sulfoxide and ethanol were used as solvent controls. The antimicrobial activity results are summarized in Table 1.

Urease inhibition assay

Reaction mixtures comprising 25 μL of Jack bean urease, 55 μL of buffer (100 mM urea, 0.01 M K₂HPO₄, 1 mM EDTA, and 0.01 M LiCl, pH 8.2), and 100 mM urea were incubated with 5 μL of the test compounds at room temperature for 15 min in microtiter plates. The production of ammonia was measured by indophenol method and used to determine the urease inhibitory activity. The phenol reagent (45 μL , 1 % w/v phenol, and 0.005 % w/v sodium nitroprusside) and alkali reagent (70 μL , 0.5 % w/v sodium hydroxide, and 0.1 % v/v NaOCl) were added to each well and the increasing absorbance at 625 nm was measured after 20 min, using a microplate reader (Molecular Device, USA). The percentage inhibition was calculated from the formula $100 - (\text{OD test well}/\text{OD control}) \times 100$. Thiourea was used as the standard inhibitor. In order to calculate IC₅₀ values, different concentrations of synthesized compounds and standard were assayed at the same reaction conditions (Weatherburn, 1967). The obtained results are presented in Table 2.

Anti-lipase activity assay

The inhibitory effects of those compounds were evaluated against porcine pancreatic lipase (PPL) (15 ng mL^{-1}). Lipase activity assay was done according to Verger *et al.*, (Woods *et al.*, 2003). Microtiter plates were coated with purified tung oil TAGs. Compounds were mixed with PPL 1:2 (v/v) and incubated for 30 min. The microtiter plates containing purified tung oil, lipase solution, and assay buffer (10 mM Tris-HCl buffer, pH 8.0, containing 150 mM NaCl, 6 mM CaCl_2 , 1 mM EDTA, and 3 mg mL^{-1} β -cyclodextrin) were recorded continuously for 40 min against the buffer alone by using microplate reader (SpectraMax M5, Molecular Devices) at 272 nm. The inhibitory activity of those compounds and Orlistat, a positive control against pancreatic lipase, were measured at concentration of 6.25, 2.08, and $1.04 \mu\text{g mL}^{-1}$. Residual activities were calculated by comparing to control without inhibitor (T+). The assays were done in triplicate. The IC_{50} value was determined as the concentration of compound that give 50 % inhibition of maximal activity. The results are presented in Table 3.

- Demirbas N, Ugurluoğlu R, Demirbas A (2002) Synthesis of 3-alkyl(aryl)-4-alkylidenamino-4,5-dihydro-1*H*-1,2,4-triazol-5-ones and 3-alkyl-4-alkylamino-4,5-dihydro-1*H*-1,2,4-triazol-5-ones as antitumor agents. *Bioorg Med Chem* 10:3717–3723
- Demirbas A, Sahin D, Demirbas N, Alpay Karaoglu S (2009) Synthesis of some new 1,3,4-thiadiazol-2-ylmethyl-1,2,4-triazole derivatives and investigation of their antimicrobial activities. *Eur J Med Chem* 44:2896–2903
- Foroumadi A, Emami S, Mehni M, Hassan M, Shafiee A (2005) Synthesis and antibacterial activity of *N*-[2-(5-bromothiophen-2-yl)-2-oxoethyl] and *N*-[(2-(5-bromothiophen-2-yl)-2-oximinoethyl] derivatives of piperazinyl quinolones. *Bioorg Med Chem Lett* 15:4536–4539
- Havrylyuk D, Zimenkovsky B, Vasylenko O, Zaprutko L, Gzella A, Lesyk R (2009) Synthesis of novel thiazolone-based compounds containing pyrazoline moiety and evaluation of their anticancer activity. *Eur J Med Chem* 44:1396–1404
- Hearn MJ, Cynamon MH (2004) Design and synthesis of antituberculars: preparation and evaluation against *Mycobacterium tuberculosis* of an isoniazid Schiff base. *J Antimicrob. Chemother* 53:185–191
- Holla BS, Rao BS, Sarojini Holla BK, Akberali PM, Kumari NS (2006) Synthesis and studies on some new fluorine containing triazolothiadiazines as possible antibacterial, antifungal and anticancer agents. *Eur J Med Chem* 41:657–663
- Jones DH, Slack R, Squires S, Wooldridge KRH (1965) Antiviral chemotherapy. I. The activity of pyridine and quinoline derivatives against neurovaccinia in mice. *J Med Chem* 8:676–680
- Karthikeyan MS, Prasad DJ, Poojary B, Bhat KS, Holla BS, Kumari NS (2006) Synthesis and biological activity of Schiff and Mannich bases bearing 2,4-dichloro-5-fluorophenyl moiety. *Bioorg Med Chem* 14:7482–7489
- Kategaonkar AH, Shinde PV, Kategaonkar AH, Pasale SK, Shingate BB, Shingare MS (2010) Synthesis and biological evaluation of new 2-chloro-3-((4-phenyl-1*H*-1,2,3-triazol-1-yl)methyl)quinoline derivatives via click chemistry approach. *Eur J Med Chem* 45:3142–3146
- Lohray BB, Lohray VB, Srivastava BK, Gupta S, Solanki M, Pandya P, Kapadnis P (2006) Novel 4-*N*-substituted aryl pent-2-ene-1,4-dione derivatives of piperazinylloxazolidinones as antibacterials. *Bioorg Med Chem Lett* 16:1557–1561
- Lv PC, Zhou CF, Chen J, Liu PG, Wang KR, Mao WJ, Li HQ, Yang Y, Xiong J, Zhu HL (2010) Design, synthesis and biological evaluation of thiazolidinone derivatives as potential EGFR and HER-2 kinase inhibitors. *Bioorg Med Chem* 18(2010):314–319
- Mallikarjuna BP, Sastry BS, Kumar GVS, Rajendraprasad Y, Chandrashekar SM, Sathisha K (2009) Synthesis of new 4-isopropylthiazole hydrazide analogs and some derived clubbed triazole, oxadiazole ring system—a novel class of potential antibacterial, antifungal and antitubercular agents. *Eur J Med Chem* 44:4739–4746
- Metwally NH, Abdalla MA, Mosselhi MAN, El-Desoky EA (2010) Synthesis and antimicrobial activity of some new *N*-glycosides of 2-thioxo-4-thiazolidinone derivatives. *Carbohydr. Res.* 345:1135–1141
- Mushtaque M, Avcilla F, Azam A (2012) Synthesis, characterization and structure optimization of a series of thiazolidinone derivatives as *Entamoeba histolytica* inhibitors. *Eur J Med Chem* 55:439–448

- Patole J, Shingnapurkar D, Padhye S, Ratledge C (2006) Schiff base conjugates of *p*-aminosalicylic acid as antimycobacterial agents. *Bioorg Med Chem Lett* 16:1514–1517
- Ren S, Wang R, Komatsu K, Bonaz-Krause P, Zyrianov Y, McKenna CE, Csipke C, Tokes ZA, Lien EJ (2002) Synthesis, biological evaluation, and quantitative structure-activity relationship analysis of new Schiff bases of hydroxysemicarbazide as potential antitumor agents. *J Med Chem* 45:410–419
- Subtelna I, Atamanyuk D, Szymanska E, Konowicz KK, Zimenkovsky B, Vasylenko O, Gzella A, Lesyk R (2010) Synthesis of 5-arylidene-2-amino-4-azolones and evaluation of their anticancer activity. *Bioorg Med Chem* 18:5090–5102
- Vicini P, Geronikaki A, Incerti M, Zani F, Dearden J, Hewitt M (2008) *Bioorg Med Chem* 16:3714–3724
- Walczak K, Gondela A, Suwinski J (2004) Synthesis and anti-tuberculosis activity of *N*-aryl-*C*-nitroazoles. *Eur J Med Chem* 39:849–853
- Wang S, Zhao Y, Zhang G, Lv Y, Zhang N, Gong P (2011) Design, synthesis and biological evaluation of novel 4-thiazolidinones containing indolin-2-one moiety as potential antitumor agent. *Eur J Med Chem* 46:3509–3518
- Weatherburn MW (1967) Phenol-hypochlorite reaction for determination of ammonia. *Anal Chem* 39:971–974
