# SYNTHESIS OF DEOXYCYTIDINE (dC) BUILDING BLOCKS FOR AMIDE-LINKED DIMERS OR OLIGOMERS: EXAMPLE OF A DEOXYCYTIDINE-AMIDE-THYMIDINE DIMER

Evelyne Grunder-Klotz and George Just •

Department of Chemistry, McGill University, Montreal, Quebec, Canada H3A 2K6

Abstract: 5'-Azido-3'-carbomethoxymethyl-4-N-benzoyl-2',3',5'-trideoxy-cytidine 17 and 5'-O-t-butyldimethylsilyl-3'-carboxymethyl-4-N-benzoyl-2',3'-dideocytidine 22 were efficiently synthesized from 2'-deoxyuridine via a new method which transformed the uracil heterocycle to 4-N-benzoylcytosine (four steps, 60 % overall yield). The amide-linked deoxycytidine-thymidine dimer analog was synthesized.

# INTRODUCTION

Recently, our research has been focused on the synthesis of 3'-carbonsubstituted-2',3'-dideoxynucleosides and amide-linked thymidine dimers (TaT)  $^{1, 2}$ . These backbone modified oligodeoxynucleotides hybridize to RNA as strongly as does natural DNA, with excellent selectivity  $^{2, 3}$ . They offer promise for potential oligodeoxynucleotide therapy utilizing either antisense  $^{4, 5}$  and perhaps antigene  $^{6}$ technologies.

In view of the above results, we decided to develop amide-linked dimers or oligomers containing deoxycytidine (dC). This is particularly important since it is well known that the stability of the binding between the oligonucleotide and its target sequence increases with the proportion of dG-dC base pairs (Watson-Crick hybridization) in the antisense strategy and of triplex binding motif dC<sup>+</sup> x dG-dC (Hoogsteen base triplets) in the antigene methodology 7.

We now wish to report our results in the synthesis of useful deoxycytidine intermediates and dCaT dimer.

# **RESULTS AND DISCUSSION**

Our first target molecule was the 3'-allyl-3'-deoxycytidine derivative of type 4, which we planned to prepare by adapting a procedure developed by Chu *et al* for the synthesis of the corresponding thymidine derivative <sup>8</sup>. The 5'-position of N-benzoyl-deoxycytidine was first protected either as its t-butyldiphenyl- (1) or t-butyldimethylsilyl ether (2). Whereas phenoxythiocarbonylation of the former did not proceed to provide a recognizable product using a variety of conditions, 2 could be transformed to its thiocarbonate 3 in 45 % yield. However, tributylallyl tin mediated allylation proceeded in only 7 % yield <sup>9</sup>. The use of N-methyl-2-pyrrolidine amidine as a protecting group of the exocyclic amine function of deoxycytidine 5 for the desired transformation 5 to 7 did not lead to much improved results 10,11,12 We therefore abandoned this approach and decided to use 2'-deoxyuridine (dU) as starting material.

Oxidation of 3'-allyl-2',3'-dideoxyuridine derivative 8 (made in three steps from dU <sup>8</sup>) with OsO<sub>4</sub>/NaIO<sub>4</sub> gave a 43 % yield of the aldehyde 9<sup>13</sup> (SCHEME 2). This compound on treatment with PDC/methanol in dry DMF afforded the methyl ester 10 in 56% yield <sup>14</sup>.

## SCHEME 2

Several methods are known to introduce a protected amine in the 4-position of uridine 15,16,17. We developed our own procedure which does not require any specialized equipment and is particularly easy to carry out . Reaction of dU 10 with mesitylenesulfonyl chloride, followed by displacement of mesitylenesulfonate from the intermediate 11 with sodium azide, using a method described for modified ribonucleosides by Nyilas and Chattopadhyaya 18,19, gave a 54 % isolated yield of the pure product 12. The azido function was then reduced to the amine in 94 % yield, by a [Sn(SPh)3] 20,21,22 published. highly selective reducing agent recently Protection of the exocyclic amine of dC 13 with benzoyl chloride in pyridine <sup>23</sup> afforded 84% of pure isolated N-benzoyl-dC 14. Subsequent removal of the t-butyldimethylsilyl group and activation of the primary alcohol obtained with methanesulfonyl chloride gave a 54 % overall yield of the crystalline mesylate 16. Conversion to the 5'-azide 17 was achieved in 74 % yield by reaction with sodium azide.

To the best of your knowledge, compounds 15,16 and 17 are the first 3'-ethylsubstituted-2',3'-dideoxycytidines described which were obtained by direct functionalization of nucleosides. Azide 17 is a good candidate to be a repeating unit

# SCHEME 3

with the azide serving as a masked amine, if one were to make amide-linked homooligonucleotides 23,24.

In order, to prepare the 5'-unit of dC-dimers or -oligomers, we synthesized carboxylic acid 22, using our new method of transformation of uracil to cytosine (SCHEME 3). rapidly Allyl derivative 8 was easilv and transformed in the 4-N-benzoyl-dC derivative 4 in 67% overall yield by the sequence described before. In all these reactions, the allyl compounds could be followed on the by the specific vellow coloration using anisaldehyde dipping (see experimental section, general methods). Oxidation of the allyl compound 4 with OsO4/NaIO4 gave a 35 % yield of the aldehyde 21. Surprisingly, 21 was unstable on tlc (2D tlc), a silica gel column and in a mildly acidic solvent (CDCl3). The only way to purify and characterize it was to crystallise the crude product from hexane/ethyl acetate. Subsequent oxidation of aldehyde 21 to the carboxylic acid derivative 22, without loosing the t-butyldimethylsilyl group, was achieved in 75 % yield using sodium chlorite under buffered conditions 25,26,27. Acid 22 obtained was pure enought to be used for the following reaction. The successful

#### SCHEME 4

coupling (SCHEME 4) of the nucleosides 22 and 23, obtained in three steps from thymidine  $^{28}$ , was carried out in 69% yield, using the BOP peptide coupling reagent  $^2$ . <sup>29</sup>. The structure of the dimer dCaT 24 was confirmed by detailed <sup>1</sup>H and <sup>13</sup>C-NMR analysis at 500 and 100 MHz respectively, as well as by FAB mass spectrometry in which an ion at m/e 733 [M+Na<sup>+</sup>] was observed.

In summary, the deoxycytidine derivatives 17 and 22 required for the preparation of amide-linked DNA analogues have been efficiently synthesized. Coupling of unit 22 with 23 has been successfully carried out, and 24 is the first example of a deoxycytidine-thymidine amide linked dimer described. The synthetic sequence allows for easy scale-up, and it should therefore be possible to prepare adequate amounts of the monomer for binding studies. The preparation of longer strands, as well as suitably protected shorter fragments activated for incorporation into natural DNA by automated solid-phase methods is ongoing.

# EXPERIMENTAL

# General Methods.

Melting points were determined on a Gallenkamp block and are uncorrected. Optical rotation measurements were carried out in the indicated solvents employing a Jasco DIP-140 digital polarimeter and a 1-dm cell. Low resolution chemical ionization mass spectra (CI-MS) and fast atom bombardement (FAB-MS) were obtained on an KRATOS MS 25RFA spectrometer in the direct-inlet mode. High and low resolution FAB mass spectra of compounds 17 and 24 were obtained on a ZAB 2F HS spectrometer in the direct-inlet mode. <sup>1</sup>H-NMR spectra were recorded on either a Varian XL-200 or Varian UNITY 500 spectrometer. <sup>13</sup>C-NMR spectra were obtained on either a Varian XL-200 or Varian UNITY 500 at 50.4 or 125.7 MHz and the peak assignments were made, in some cases, with the aid of HETCOR, HMQC or HMBC experiments.

All air sensitive experiments were carried out under argon, with freshly dried, distilled solvents. Dichloromethane and 1,2-dichloroethane were distilled from P<sub>2</sub>O<sub>5</sub>. Pyridine, triethylamine, acetonitrile were distilled from CaH<sub>2</sub>. Toluene was dried over sodium wire, N,N-dimethylformamide (DMF) was dried by shaking with KOH followed by distillation at reduced pressure from BaO. Methanol was distilled from magnesium. Thin-Layer Chromatography (tlc) was performed using Kieselgel 60 F<sub>254</sub> aluminium-backed plates (0.2 mm thickness) and visualized by UV and dipping in different solution A, B or C followed by heating.

Solution A: Ammonium molybdate (2.5 g) and ceric sulfate (1.0 g) in 10% v/v aqueous sulfuric acid (100 mL). Solution B: p-Anisaldehyde (5 mL), sulfuric acid (50 mL), acetic acid (100 mL) and ethanol (850 mL). Solution C: KMnO<sub>4</sub> (1.0 g) and water (100 mL).

All compounds were shown to be homogeneous by tlc and <sup>1</sup>H-NMR.

# 5'-O-t-Butyldimethylsilyl-3'-(2''-oxoethyl)-2',3'-dideoxyuridine 9

To a solution of 8 (550 mg, 1.50 mmol) in a mixture of ether/water (1/1, 40 mL) and OsO4 (10 mg, 39 µmol) was added slowly over a period of 20 min NaIO<sub>4</sub> (810 mg, 3.79 mmol). After stirring at room temperature for 5 h, the aqueous layer was extracted with ether (50 mL) and the combined organic phases were washed with 5% aq. NaHCO3 (50 mL), brine (50 mL) and dried over MgSO<sub>4</sub>. After evaporation in vacuo, silica gel column chromatography using hex/AcOEt : 4/6 as eluent gave 9 as a syrup (235 mg, 43%). # 5'-O-t-Butyldimethylsilyl-3'-carbomethoxymethyl-4-desamino-4-azido-2',3'-dideocytidine 12

To a stirred solution of 10 (100 mg, 0.25 mmol) in dry 1,2-dichloroethane (10 mL) was added, at room temperature under argon, triethylamine (175  $\mu$ L, 1.26 mmol), 4-dimethylaminopyridine (5 mg, 41 µmol) and mesitylenesulfonyl chloride (82 mg, 0.37 mmol). The reaction mixture was stirred for 4 h and then washed with water (10 mL). The organic layer was separated, dried (MgSO4), filtered and evaporated in vacuo. The intermediate mesitylenesulfonyl derivative 11 was dissolved in DMF (5 mL) and sodium azide (49 mg, 0.62 mmol) was added with stirring under argon. After one night at room temperature, the solvent was evaporated in vacuo. The residue was diluted with AcOEt (10 mL) and washed with water (8 mL). The organic layer was separated, dried (MgSO4), filtered and evaporated in vacuo. The crude product was purified by silica gel column chromatography using hex/AcOEt : 6/4 as eluent. The title compound 12 was obtained as a colourless oil (57 mg, 54%).  $[\alpha]_{D} = +69.2 \circ (CDCl_{3}, c = 5.7)$ . <sup>1</sup>H-NMR (CDCl\_{3}, 200 MHz)  $\delta 0.11 [s, 3H, Si(CH_{3})], 0.13$ [s, 3H, Si(CH3)], 0.93 [s, 9H, SiC(CH3)3], 2.28-2.78 [m, 5H, H-2', H-2'', H-3' and CH2], 3.66 [s, 3H, CH3O], 3.74-3.94 [m, 2H, H-4', H-5'], 4.08-4.15 [m, 1H, H-5'], 6.30 [dd, 1H, J = 2.7 and 6.5 Hz, H-1'], 6.79 [d, 1H, J = 7.9 Hz, H-5], 8.39 [d, 1H, J = 7.8 Hz, H-6]. <sup>13</sup>C-NMR (CDCl<sub>3</sub>, 50.4 MHz) δ -6.52 [CH<sub>3</sub>Si], 18.93 [CSi], 26.36 [CH<sub>3</sub>], 33.20, 36.02, 40.43 [C<sub>2</sub>, C<sub>3</sub>, CH<sub>2</sub>], 52.48 [CH<sub>3</sub>O], 62.23 [C<sub>5</sub>], 87.27, 87.46 [C<sub>1</sub>, C<sub>4</sub>], 93.50 [C<sub>5</sub>], 135.30 [C<sub>6</sub>], 142.93 [C4], 151.38 [C2], 172.05 [CO]. # 5'-O-t-Butyldimethylsilyl-3'-carbomethoxymethyl-2',3'-dideoxycytidine 13

To a stirred solution of anhydrous stannous chloride (56 mg, 0.29 mmol) and thiophenol (121  $\mu$ L, 1.18 mmol) in dry acetonitrile (2 mL) was added dropwise under

argon a solution of 12 (42 mg, 99  $\mu$ mol) in dry acetonitrile (1 mL). After 24 h, the solvents were evaporated in vacuo and the residue was diluted with dichloromethane (5 mL). This organic layer was washed with 1N aq. NaOH (2 mL) and the aqueous layer reextracted twice with dichloromethane (3 mL). All organic layers were washed with brine (10 mL), dried (MgSO<sub>4</sub>) and filtered. Evaporation and purification by silica gel column chromatography (CH<sub>2</sub>Cl<sub>2</sub>/MeOH : 95/5) gave title compound as a white powder (37 mg, 94%). [ $\alpha$ ]<sub>D</sub> = +52.0 ° (CDCl<sub>3</sub>, c = 3.7). <sup>1</sup>H-NMR (CDCl<sub>3</sub>, 200 MHz)  $\delta$  0.08 [s, 6H, Si(CH<sub>3</sub>)<sub>2</sub>], 0.90 [s, 9H, SiC(CH<sub>3</sub>)<sub>3</sub>], 2.15-2.63 [m, 5H, H-2', H-2'', H-3' and CH<sub>2</sub>], 3.65 [s, 3H, CH<sub>3</sub>], 3.74-4.04 [m, 2H, H-4', H-5'], 4.15-4.21 [m, 1H, H-5''], 5.64 [d, 1H, J = 7.4 Hz, H-5], 6.06-6.11 [dd, 1H, J = 3.1 and 6.3 Hz, H-1'], 8.08 [d, 1H, J = 7.4 Hz, H-6].

# 5'-O-t-Butyldimethylsilyl-3'-carbomethoxymethyl-4-N-benzoyl-2',3'-dideoxy cytidine 14

To a solution of 13 (35 mg, 88 µmol) in dry pyridine (1 mL) was added dropwise, under stirring and argon, benzoyl chloride (51 µL, 440 µmol). After 2 h, the pyridine was evaporated and the residue dissolved in AcOEt (10 mL). This organic layer was washed with 0.5 N aq. HCl solution (10 mL) and then brine (5 mL). The organic phase was separated, dried (MgSO4), filtered and evaporated in vacuo. The crude product was purified by silica gel column chromatography with CH<sub>2</sub>Cl<sub>2</sub>/MeOH : 98/2 as eluent to give 14 as a thick colourless syrup (37 mg, 84%). <sup>1</sup>H-NMR (CDCl<sub>3</sub>, 200 MHz)  $\delta$  0.13 [s, 3H, Si(CH<sub>3</sub>)], 0.14 [s, 3H, Si(CH<sub>3</sub>)], 0.94 [s, 9H, SiC(CH<sub>3</sub>)<sub>3</sub>], 2.25-2.65 [m, 5H, H-2', H-2'', H-3, and CH<sub>2</sub>], 3.67 [s, 3H, CH<sub>3</sub>], 3.71-3.88 [m, 2H, H-4', H-5'], 4.06-4.14 [m, 1H, H-5''], 6.11 [m, 1H, H-1'], 7.40-7.61 [m, 4H, 3 H<sub>arom</sub>. and H-5'], 7.91-7.96 [m, 2H, 2 H<sub>arom</sub>.], 8.08-8.13 [large d, 1H, J = 8.5 Hz, NH], 8.60 [d, 1H, J= 7.3 Hz, H-6]. LRMS (FAB-NBA): m/e 524 ([M+Na<sup>+</sup>], 4), 502 ([MH<sup>+</sup>], 12), 287 (36), 216 (100), 165 (59), 155 (88).

# 3'-Carbomethoxymethyl-4-N-benzoyl-2',3'-dideoxycytidine 15

To s solution of 14 (35 mg, 70  $\mu$ mol) in dry THF (2 mL) was added dropwise under argon and stirring a 1M solution of tetrabutylammonium fluoride (TBAF) in THF (0.21 mL, 210  $\mu$ mol). After 3 h, the solvent was evaporated in vacuo. The residue was chromatographed on a silica gel column using CH<sub>2</sub>Cl<sub>2</sub>/MeOH : 5/0.2 as eluent to give 15 as a white solid (25 mg, 92%). <sup>1</sup>H-NMR (CDCl<sub>3</sub> + few drops MeOD, 200 MHz) & 2.37-2.85 (m, 5H, H-2', H-2'', H-3', CH<sub>2</sub>), 3.68-4.18 (m, 3H, H-5', H-5'', H-4'), 3.79 (s, 3H, CH<sub>3</sub>O), 6.25 (m, 1H, H-1'), 7.54-7.88 (m, 4H, H-5, 3 H<sub>arom</sub>.), 8.00-8.17 (m, 2H, 2H<sub>arom</sub>.) 8.86 (d, 1H, J = 7.5 Hz, H-6).

# 5'-O-Mesyl-3'-carbomethoxymethyl-4-N-benzoyl-2',3'-dideoxycytidine 16

To a solution of **15** (23 mg, 59 µmol) and triethylamine (17 µL, 122 µmol) in dry dichloromethane (1 mL) was added dropwise, at 0°C under argon and stirring, methanesulfonyl chloride (7 µL, 90 µmol). After 2 h, the mixture was diluted with CH<sub>2</sub>Cl<sub>2</sub> (10 mL) and washed with aq. HCl 0.5 N (10 mL). The organic layer was dried (MgSO<sub>4</sub>) and evaporated in vacuo. The crude product was purified by silica gel column chromatography with CH<sub>2</sub>Cl<sub>2</sub>/MeOH : 5/0.2 as eluent to provide **16** as a white solid (16 mg, 58%); m.p. (dec.) 207 °C. <sup>1</sup>H NMR (CDCl<sub>3</sub>, 200 MHz)  $\delta$  2.24-2.67 [m, 5H, H-2', H-2'', H-3', and CH<sub>2</sub>], 3.25 [s, 3H, CH<sub>3</sub>SO<sub>2</sub>], 3.59 [s, 3H, CH<sub>3</sub>O], 4.02-4.09 [m, 1H, H-4'], 4.49-4.54 [m, 2H, 2 H-5], 6.03 [m, 1H, H-1'], 7.38 [d, 1H, J = 7.2 Hz, H-5], 7.46-7.62 [m, 3H, 3 H<sub>arom</sub>], 7.97-8.01 [m, 2H, 2 H<sub>arom</sub>], 8.20 [d, 1H, J = 7.4 Hz, H-6].

# 5'-Azido-3'-carbomethoxymethyl-4-N-benzoyl-2',3',5'-trideoxycytidine 17

To a solution of **16** (12 mg, 26 µmol) in dry DMF (1 mL) was added at room temperature, under argon, sodium azide (5 mg, 77 µmol). The reaction was stirred at 80 °C for 12 h and the DMF was evaporated in-vacuo. The residue was diluted with ethyl acetate (10 mL) and washed with water (5 mL). The organic layer was dried (MgSO<sub>4</sub>) and evaporated. Purification by silica gel column chromatography with CH<sub>2</sub>Cl<sub>2</sub>/MeOH: 5/0.2 as eluent gave **17** as a white solid (8 mg, 74%). <sup>1</sup>H-NMR (CDCl<sub>3</sub>, 200 MHz)  $\delta$  2.31-2.58 [m, 5H, H-2', H-2'', H-3' and CH<sub>2</sub>], 3.59-3.99 [m, 3H, H-5', H-5'' and H-4'], 3.70 [s, 3H, CH<sub>3</sub>O], 6.11 [dd, 1H, J = 4.1 and 6.0 Hz, H-1'], 7.47-7.66 [m, 4H, 3H<sub>arom</sub>. and H-5], 7.90-7.94 [m, 2H, 2H<sub>arom</sub>.], 8.30 [d, 1H, J = 7.6 Hz, H-6]. # 5'-O-t-Butyldimethylsilyl-3'-carboxymethyl-4-N-benzoyl-2',3'-dideoxycytidine 22

To a solution of **21** (5 mg, 11 µmol) in t-BuOH (1 mL) was added 2-methylbut-2-ene (16 µL, 190 µmol), NaClO<sub>2</sub> (2 mg, 18 µmol) and NaH<sub>2</sub>PO<sub>4</sub> (2 mg, 18 µmol, dissolved in 0.5 mL of water). After stirring at room temperature overnight, t-BuOH was evaporated at room temperature. Water (3 mL) was then added to the residue, and the aqueous phase was extracted with ethyl acetate (10 mL and 5 mL). The combined organic phase was extracted with ethyl acetate (10 mL and 5 mL). The combined organic phase was washed with brine (5 mL) and dried over MgSO<sub>4</sub>. After evaporation of the solvent in vacuo, the product was pure enough (tlc, NMR <sup>1</sup>H and <sup>13</sup>C) for further reaction, yield 75 % (4 mg). <sup>1</sup>H-NMR (acetone, 500 MHz)  $\delta$  0.18 [s, 3H, CH<sub>3</sub>Si], 0.19 [s, 3H, CH<sub>3</sub>Si], 0.98 [s, 9H, SiC(CH<sub>3</sub>)<sub>3</sub>], 2.35-2.77 [m, 5H, H-2', H-2", H-3', CH<sub>2</sub>], 3.92-3.98 [m, 2H, H-4', H-5], 4.14-4.17 [m, 1H, H-5"], 6.03-6.05 [m, 1H, H-1'], 7.40-7.67 [m, 4H, H-5, H<sub>arom</sub>], 8.15-8.17 [m, 2H, 2 H<sub>arom</sub>], 8.62 [d, J = 7.3 Hz, H-6], 10.35 [large s, 1H, COOH]. <sup>13</sup>C-NMR (Acetone, 125.7 MHz]  $\delta$  -6.93 [CH<sub>3</sub>Si], 17.37 [CSi], 24.84 [CH<sub>3</sub>], 31.85, 34.19, 44.46 [C<sub>2</sub>', C<sub>3</sub>', CH<sub>2</sub>], 61.28 [C<sub>5</sub>'], 86.04 [C<sub>1</sub>', C<sub>4</sub>'], 94.92 [C<sub>5</sub>], 127.62, 128.09, 132.29 [CH<sub>arom</sub>], 133.21 [C<sub>arom</sub>], 144.10 [C<sub>6</sub>], 153.78 [C<sub>2</sub>], 162.19 [C<sub>4</sub>] 167.33 [CO berzoyl], 192.08 [COOH].

# Dimer 3'-dCaT-5' 24

To a solution of acid 22 (4 mg, 8  $\mu$ mol) and amine 23 (2 mg, 8  $\mu$ mol) in dry DMF (1 mL) was added triethylamine (2  $\mu$ L, 14  $\mu$ mol) and then benzotriazol-1-yloxy-tris(dimethylamino)phosphonium hexafluorophosphate (BOP, 4 mg, 9  $\mu$ mol). After stirring 2 h at room temperature, DMF was evaporated; ethyl acetate (10 mL) was then added to the residue. This organic layer was washed with water ( 5 mL), brine ( 5 mL) and dried with MgSO4. The solid crude product, obtained after evaporation in vacuo of

the solvent, was purified by a silica gel column chromatography using CH<sub>2</sub>Cl<sub>2</sub>/MeOH: 93/7 as eluent. The title compound was obtained as a white solid (4 mg, 69 %). <sup>1</sup>H-NMR (MeOD, 500 MHz)  $\delta$  0.17 [s, 3H, CH<sub>3</sub>Si], 0.18 [s, 3H, CH<sub>3</sub>Si], 0.98 [s, 9H, SiC(CH<sub>3</sub>)<sub>3</sub>], 1.82 [s, 3H, CH<sub>3</sub>], 2.17-2.44 [m, 6H, 2 H-2', 2 H-2'', CH<sub>2</sub>], 2.65-2.72 [m, 1H, H-3'<sub>dC</sub>], 3.30-3.37 [m, 2H, H-4'<sub>T</sub>, H-5'<sub>T</sub>], 3.54-3.58 [m, 1H, H-5''<sub>T</sub>], 3.85-3.93 [m, 2H, H-5'<sub>dC</sub>, H-4'<sub>dC</sub>], 4.12-4.15 [m, 1H, H-5''<sub>dC</sub>], 4.21-4.22 [m, 1H, H-3'<sub>T</sub>], 5.99 [m, 1H, H-1'<sub>dC</sub>], 6.18 [m, 1H, H-1'<sub>T</sub>], 7.50 [s, 1H, H-6<sub>T</sub>], 7.53-7.64 [m, 4H, H-5<sub>dC</sub>, 3 H<sub>arom</sub>], 7.99-8.01 [m, 2H, 2 H<sub>arom</sub>], 8.73 [d, 1H, J = 7.3 Hz, H-6<sub>dC</sub>]. <sup>13</sup>C-NMR (MeOD, 125.7 MHz)  $\delta$  -8.79 [CH<sub>3</sub>Si], 8.96 [CH<sub>3</sub>T], 17.84 [CSi], 23.44 [CH<sub>3</sub>], 30.92, 35.12, 36.99, 37.46 [CH<sub>2</sub>, C<sub>3'dC</sub>, C<sub>2'dC</sub>, C<sub>2'T</sub>], 39.33 [C<sub>5'T</sub>], 45.87 [C<sub>4'T</sub>], 59.88 [C<sub>5'dC</sub>], 70.16 [C<sub>3'T</sub>], 83.24 [C<sub>4'dC</sub>], 84.17 [C<sub>1'T</sub>], 85.11 [C<sub>1'dC</sub>], 94.45 [C<sub>5dC</sub>], 108.47 [C<sub>5T</sub>], 126.22, 126.69, 130.89 [CH<sub>arom</sub>], 135.10 [C<sub>arom</sub>], 143.51 [C<sub>6dC</sub>], 149.11 [C<sub>6T</sub>], 150.35 [C<sub>2T</sub>], 154.72 [C<sub>2dC</sub>], 161.73 [C<sub>4dC</sub>], 163.13 [C<sub>4T</sub>], 171.07 [CO benzoy]], 173.68 [CO, amide].
