

### Synthesis of 1-Aryl-4-halo-2-pyrazolin-5-ones by Ascorbic Acid Reduction of 1-Aryl-4,4-dihalo-2-pyrazolin-5-ones

Michael J. SPITULNIK

Synthetic Chemicals Division, Eastman Kodak Company, Rochester, New York 14650, U.S.A.

Synthesis of 4-halo-2-pyrazolin-5-ones by direct halogenation is complicated by the fact that the product is often contaminated with 4,4-dihalo derivatives and in many cases this is the major component. If the 3-position is substituted with an anilino or acylamino group, monohalogenation is especially difficult<sup>1</sup>. On the other hand, dichlorination and dibromination proceed smoothly under a variety of conditions.

Selective reduction of 4,4-dichloro-2-pyrazolin-5-one compounds has been accomplished in a two-step process involving first reaction with triethyl phosphite followed by alkaline hydrolysis of the intermediate phosphate ester as shown<sup>1</sup> (Scheme A).

Scheme A

Reported here is an improved method whereby 4,4-dichloro- or 4,4-dibromo-1-aryl-2-pyrazolin-5-ones **1** are selectively reduced to the monohalo derivative **2** by reaction with ascorbic acid and an organic base such as triethylamine at 20–30°C. Acidification then yields the product **3** (Scheme B).

<sup>a</sup> Compound **2** not isolated

Scheme B

Compounds **3** are relatively strong acids which in all probability provide the driving force for mild reduction of **1** under alkaline conditions. The intermediate enolate salt **2** resists further reduction under the conditions of the reaction.

Extension of this reaction to other 1,3-unsaturated-2-dihalogenated systems is possible. For example, 2,2-dibromo-1,3-indanedione (**4a**) and 2,2-dichloro-1,3-indanedione (**4b**) are cleanly reduced to the monohalo derivatives **5** (Scheme C). However, 2,2-dibromo-1,3-diphenyl-1,3-propanedione gives 1,3-diphenyl-1,3-propanedione in good yield with excess ascorbic acid. Mixtures containing some monobromo product are obtained when an equivalent of ascorbic acid is used.

Scheme C

#### Chlorination or Bromination; General Procedure:

To a solution containing the 1-substituted 2-pyrazolin-5-one (0.05 mol) in acetic acid (100 ml) is slowly added 1,3-dichloro-5,5-dimethylhydantoin or 1,3-dibromo-5,5-dimethylhydantoin (0.05 mol) maintaining the temperature at 20°C by external cooling. After slurring for 2 h, the mixture is cooled and the product **1** is collected. Alternatively, the product **1** can be precipitated from the mixture by dilution with water. This can be used as is or recrystallized from methanol to obtain analytically pure material. 1,3-Indanedione is similarly halogenated to give **4a, b**.

#### Ascorbic Acid Reduction; General Procedure:

To a solution containing ascorbic acid (10 g, 0.06 mol) and triethylamine (50 ml) in methanol (100 ml) is added the appropriate 4,4-dihalo-2-pyrazolin-5-one **1** (0.04 mol). The temperature is maintained at 20–30°C by rate of addition or external cooling. Solution is obtained upon reaction. After stirring for 15 min, the mixture is acidified by pouring it into cold dilute hydrochloric acid causing
