#### Abstract

Thermal electrocyclic ring-opening of 4-alkyl-2-cyclobutene-1-carbaldehydes occurs at low temperature to give ( $2 Z, 4 E$ )-alkadienals exclusively, and the process is exploited in transforming cis-3-cyclobutene-1,2-dimethanol 1 into a variety of naturally occurring 1,3,5-alkatrienes and 2,4-decadienoates. Desymmetrisation of 1 with Pseudomonas fluorescens lipase gives access to both enantiomers of 3oxabicyclo[ 3.2 .0 ]hept- 6 -en-2-one 4 , for use in stereocontrolled routes to 6 -oxygenated ( $2 Z, 4 E$ )-alkadienals.

On the basis of orbital symmetry considerations, it is predicted that the thermal electrocyclic ring-opening of an unsymmetrical cis-1,4-disubstituted 2 -cyclobutene might produce two isomeric ( $Z, E$ )-dienes. ${ }^{2}$ However, recent studies have demonstrated that the stereochemical outcome of the process is strongly influenced by the electronic effects of the allylic substituents, with $\pi$-donors preferring 'outward' conrotation and $\pi$-acceptors more readily undergoing the alternative 'inward' motion. ${ }^{3-5}$ In this context we showed that monoprotection and Swern oxidation of cis-2-cyclobutene-1,4-dimethanol 1 leads to a cyclobutene 2 whose allylic substituents (formyl, alkoxyalkyl) have complementary conrotation preferences, and which as a consequence undergoes thermal electrocyclic ring-opening at low temperature to give the ( $Z, E$ )-dienal 3 exclusively (Scheme 1 ). ${ }^{3.6}$ We considered that the above principle might be usefully exploited in approaches to naturally occurring conjugated polyenes, including some of the many biologically-active systems which bear oxygen substituents in allylic positions, and we herein describe in detail ${ }^{7}$ the results of our efforts directed toward this objective, which reveal the diol 1 and the derived lactones $(+)-4$ and $(-)-4$ to be potentially versatile diene precursors.

SCHEME 1 ( $\mathrm{R}=4-\mathrm{MeOC}_{6} \mathrm{H}_{4} \mathrm{CH}_{2}$ )
For applications in polyene synthesis it was necessary to develop general methods by which substituents could be included at the termini of a ( $Z, E)$-diene fragment such as 3 . We surmised that it would be most convenient to introduce the ( $E$ )-terminal group at the cyclobutene stage, prior to the electrocyclic ring-opening
reaction, and to achieve this the monoether 5a, available from the diol $\mathbf{1}$ as described, ${ }^{3}$ was first converted into the tosylate $\mathbf{6}$ and then treated with the appropriate cuprate reagent (Scheme 2). Using lithium dimethylcuprate provided the ethyl-substituted cyclobutene 7 a , whereas the $n$-butyl reagent afforded 7 b , together with varying amounts of a by-product which was tentatively identified as the 2,3 -disubstituted bicyclo[2.1.0]pentane 8 .

SCHEME 2 Reagents: i, $n$-BuLi, THF-hexane, $p$ - $\mathrm{MeC}_{6} \mathrm{H}_{4} \mathrm{SO}_{2} \mathrm{Cl},-78$ to $20{ }^{\circ} \mathrm{C}(83 \%)$; ii, $\mathrm{Me}_{2} \mathrm{CuLi}$, $\mathrm{Et}_{2} \mathrm{O},-10$ to $0^{\circ} \mathrm{C}(78 \%)$; iii, $n-\mathrm{Bu}_{2} \mathrm{CuLi}, \mathrm{Et}_{2} \mathrm{O}$-hexane, -10 to $0^{\circ} \mathrm{C}(75 \%$ of $7 \mathrm{~b} ; \leq 15 \%$ of 8); iv, $\mathrm{Ac}_{2} \mathrm{O}$, pyridine, DMAP, $\mathrm{CH}_{2} \mathrm{Cl}_{2}, 20^{\circ} \mathrm{C}, 2 \mathrm{~h}(92 \%)$.

The skeletal rearrangement leading to the bicyclo[2.1.0]pentane $\mathbf{8}$ is similar to those described by Posner and coworkers, ${ }^{8}$ who studied the reactions of homoallylic tosylates and halides with organocopper reagents. Various mechanisms have been postulated for organocopper addition reactions, most involving the formation of transient copper(III) species which subsequently undergo reductive elimination of the coupled product. The putative intermediates 9 and 10 leading to the observed products are shown in Scheme 3. Deprotection of the ether 8 with 2,3-dichloro-5,6-dicyano-1,4-benzoquinone (DDQ) ${ }^{9}$ gave the alcohol 11 in $86 \%$ yield.

SCHEME 3 (MPM $=4-\mathrm{MeOC}_{6} \mathrm{H}_{4} \mathrm{CH}_{2}$ )
Deprotection of the ether 7 a using DDQ gave the alcohol 12a, which was transformed into the ( $Z, E$ )dienal 13a via Swern oxidation at $-78^{\circ} \mathrm{C}$ (Scheme 4). Florisil chromatography was used to isolate 13a with high $(>97 \%)^{10}$ isomeric purity, otherwise the product was accompanied by trace amounts of the more stable ( $E, E$ )-isomer 14a, which could be obtained pure by quenching the oxidation at $20^{\circ} \mathrm{C}$ and isolating the product by silica gel chromatography. Wittig methylenation was used to convert the dienals 13a and 14a into the respective ( $3 Z, 5 E$ )- and ( $3 E, 5 E$ )-1,3,5-octatrienes 15a and 16a, which are components of the female sex attractant of the brown seaweed Fucus serratus. ${ }^{11,12}$

SCHEME 4 (MPM = 4-MeOC $6_{4} \mathrm{H}_{4} \mathrm{CH}_{2}$ ) Reagents: i, DDQ, $\mathrm{CH}_{2} \mathrm{Cl}_{2}-\mathrm{H}_{2} \mathrm{O}, 20^{\circ} \mathrm{C}, 2 \mathrm{~h}$; ii, oxalyl chloride, $\mathrm{Me}_{2} \mathrm{SO}, \mathrm{CH}_{2} \mathrm{Cl}_{2},-78^{\circ} \mathrm{C}, 1 \mathrm{~h}$; iii, $\mathrm{Et}_{3} \mathrm{~N},-78$ to $20^{\circ} \mathrm{C}$, Florisil column; iv, -78 to $20^{\circ} \mathrm{C}$, then $\mathrm{Et}_{3} \mathrm{~N}$, silica gel column; $\mathrm{v}, \mathrm{Ph}_{3} \mathrm{P}=\mathrm{CH}_{2}, \mathrm{THF}, 0$ to $20^{\circ} \mathrm{C}$; vi, $\mathrm{MnO}_{2}, \mathrm{NaCN}, \mathrm{MeOH}$.

Repeating the sequence described above, the pentylcyclobutene 7b was transformed into the alcohol $\mathbf{1 2 b}$, and hence the isomeric dienals $\mathbf{1 3 b}$ and $\mathbf{1 4 b}$. Wittig methylenation of these aldehydes gave the respective $1,3,5$-undecatrienes $\mathbf{1 5 b}$ and $\mathbf{1 6 b}$, which occur naturally in the essential oil of galbanum (Ferula galbaniflua) ${ }^{\mathbf{1 3}}$ and the Hawaiian seaweed Dictyopteris plagiogramma; ${ }^{14}$ the ( $3 E, 5 Z$ )-triene $\mathbf{1 5 b}$ is also valued as a fragrance in the perfume industry. ${ }^{15}$ Oxidation of the dienals 13 b and 14 b with manganese(IV) oxide and sodium cyanide in methanol ${ }^{16}$ gave the respective methyl esters 17 and 18 . The ( $2 Z, 4 E$ )-isomer $17^{17}$ is a pheromone component of the forest pest Pityogenes chalcographus, ${ }^{17 \mathrm{a}}$ and a component of stillingia oil, which is obtained from the seeds of Sapium sebiferum, the Chinese tallow tree. ${ }^{18}$ The ( $E, E$ )-decadienoate 18 is a component of the flavour principles of the Bartlett pear. ${ }^{19}$

A substituent to be located at the eventual ( $Z$ )-terminus of a $(Z, E)$-diene fragment prepared in the above manner must be introduced after the electrocyclic ring-opening, since the formyl group is required as the ( $Z$ )selective control element during the conrotation process. In an initial attempt to determine whether side-chains could be coupled via nucleophilic displacement reactions (as proved effective with the tosylate 6), the ( $2 Z, 4 E$ )-dienol 19, prepared by reduction of the aldehyde $3,{ }^{3}$ was converted into the chloride 20 and treated with lithium dibutylcuprate at $-78^{\circ} \mathrm{C}$ in THF (Scheme 5). The reaction gave four products, as judged by 300 $\mathrm{MHz}{ }^{1} \mathrm{H}$ n.m.r. spectroscopy and t.l.c. on silica gel impregnated with silver nitrate, and preparative chromatography of the mixture over this medium gave clean samples of the $\alpha$-alkylated product 21 , the $\gamma$ alkylated product 23, the $\varepsilon$-alkylated product 24, and a mixed fraction containing the two $\alpha$-alkylated products 21 and 22. The clean $S_{N} 2$ displacement of the chloride 20 was thus potentially troublesome, and its reactions with a range of butylcopper and Grignard reagents were investigated in an attempt to optimise the formation of the desired product 21 (Table 1). Analysis of the crude reaction mixtures by $300 \mathrm{MHz}{ }^{1} \mathrm{H}-\mathrm{n} . \mathrm{m} . \mathrm{r}$. spectroscopy was facilitated by the readily distinguishable benzylic signals of each product. The copper mediated reactions are clearly of little synthetic value, although the variation in product distribution is of mechanistic interest. ${ }^{20}$

## TABLE 1 REACTIONS OF ORGANOMETALLIC REAGENTS WITH THE CHLORODIENE 20

To facilitate later deprotection the diol 1 was monosilylated ${ }^{21}$ to obtain the cyclobutenemethanol 25 , and the latter proved to be a suitable starting point for ( $2 E, 4 Z$ ) -dienal preparation as illustrated in Scheme 6. Swern oxidation of 25 gave the $(2 Z, 4 E)$-dienal 26 , which was immediately transformed into the alcohol 27 and hence the chloride $28 .{ }^{22}$ Treating the chloride 28 with methylmagnesium bromide gave the direct ( $\mathrm{S}_{\mathrm{N}} 2$ ) displacement product 29 ( $79 \%$ yield), and sequential desilylation and oxidation using tetra-n-propylammonium perruthenate (TPAP) $/ N$-methylmorpholine $N$-oxide (NMO) ${ }^{23}$ gave the ( $2 E, 4 Z$ )-dienal 30 . Methylenation of the dienal 30 afforded $(3 E, 5 Z)$-octatriene 31 , the remaining isomer of the mixture found in Fucus serratus. ${ }^{11}$

Considering the various means by which a cyclobutene might be transformed into a polyene with oxygen substituents in the allylic positions, there are clear advantages in establishing the desired functionality and configuration within the cyclobutene prior to ring-opening. Such a strategy allows the exploitation of both the stability and the exaggerated topology of the cyclobutene relative to those of the ( $Z, E$ )-diene target. With this in mind we carried out a series of additions of organometallic reagents to the known lactol $32,{ }^{3}$ which exists in equilibrium with the aldehyde 33 , in which the pendant hydroxymethyl group is well positioned to mediate via coordination effects the stereocontrolled addition of nucleophiles to the formyl group (Scheme 7).

Treatment of the lactol 32, generated in situ from the lactone ( $\pm$ )-4, with various organometallic reagents gave good yields of the mixed diols 34 and 35 , with the former predominant (Table 2). In the methyl series the diastereoselectivity of the addition process was improved on changing from the lithium to the Grignard reagent, and was essentially complete using a methyltitanium reagent ${ }^{25}$ (entry 4). While it was possible to distinguish and assay the diols 34 and 35 via $300 \mathrm{MHz}{ }^{1} \mathrm{H}-\mathrm{n} . \mathrm{m} . \mathrm{r}$. spectroscopy, the relative stereochemistry of the diols in two series (a and $\mathbf{e}$ ) was established by oxidation of the isolated diols 34 and 35 to the respective lactones 36 and 37 with TPAP/NMO. ${ }^{26}$ The value of the vicinal coupling constant $J_{4,5}$ in these rigid bicyclic structures is consistent with the exo and endo orientations of the R-substituents, as depicted for 36 and 37 respectively. The structures of the diols of series b-d were assigned by analogy (and characteristic ${ }^{\mathbf{1}} \mathbf{H}$-n.m.r. signals).

TABLE $2^{24}$ REACTIONS OF ORGANOMETALLIC REAGENTS WITH THE LACTOL 32

We also studied the addition of hydride reagents to the series of ketones 38-40, there being the possibility that reversing the sequence of nucleophilic additions to the lactone $\mathbf{4}$ (shown in Scheme 7) would result in the diol 35 becoming the major product. Unlike the corresponding aldehydes, each of the ketones was stable at room temperature, although the $300 \mathrm{MHz}{ }^{1} \mathrm{H}$ n.m.r. spectrum of the parent system indicated that it existed in solution as a mixture of the ketone form $\mathbf{3 8}$ and two lactols $\mathbf{4 2}$, with the latter predominating (Scheme 8).

SCHEME 8 (MPM $=4-\mathrm{MeOC}_{6} \mathrm{H}_{4} \mathrm{CH}_{2}$ ) Reagents: i, see Table 2 (entry 4); ii, NaH, MPMBr, THF ( $66 \%$, plus $15 \%$ of 44 ): iii. TPAP, NMO, $4 \AA$ sieves, $\mathrm{CH}_{2} \mathrm{Cl}_{2}, 25^{\circ} \mathrm{C}(71 \%)$; iv, MeONHMe. Treating the ketone/lactol mixture ( $\mathbf{3 8}+\mathbf{4 2}$ ) with hydride reagents gave good yields of the expected diols with diastereoselectivity up to $9: 1$, but $\mathbf{3 4 a}$ was again the major product (Table 3). In fact it was the nonselective reducing agents which afforded the highest nett yields of the minor product $\mathbf{3 5 a}$ (entries 2 and 3 ). Moderate levels of stereoselectivity were generally observed on reduction of the protected ketones 39 and $\mathbf{4 0}$, but the major product was invariably that derived from 34a.

From a mechanistic viewpoint, the formation of a diol $\mathbf{3 4}$ via the addition of an organometallic reagent to the lactol 33 (Scheme 7) is consistent with the approach of the nucleophile to the less hindered face of a chelated arrangement such as 48 . The proximity of the carbonyl and hydroxymethyl groups, inevitable by virtue of their cis disposition and the rigidity of the cyclobutene ring, engenders the coordination. The variation in selectivity on changing the metal from Li to Ti or adding a Lewis acid $\left(\mathrm{ZnBr}_{2}\right)$ are in accord with such a model. ${ }^{27}$

## TABLE $3^{24}$ REACTIONS OF HYDRIDE REAGENTS WITH THE KETONES 38-40

In the hydride additions (Table 3), the formation of 43 and 46 from the respective ketones 39 and 40 is consistent with the approach of the hydride reagent to the less hindered face of a conformation such as 49 , which corresponds to a Felkin-Anh open chain model, ${ }^{28}$ although the above results (and molecular models ${ }^{29}$ ) suggest that an alternative conformation such as 50 is also readily accessible. As might be anticipated, the selectivity is optimal when a sterically encumbered hydride reagent is used in conjunction with a substrate bearing a bulky, poorly coordinating 4'-substituent (Table 3, entry 19). Moreover the proportion of diol 47 obtained on reducing 40 with diisobutylaluminium hydride (DIBAH) is enhanced in the presence of $\mathrm{ZnBr}_{2}$ (entries 13 and 14), implying that a chelated arrangement 51 ( $c f .48$ ) is also possible but not predominant, while the selectivity obtained using sodium triacetoxyborohydride (Table 3, entry 6), whose reducing ability is potentiated by coordination to an hydroxyl group, ${ }^{30}$ is consistent with the internal delivery of hydride via a conformation such as $\mathbf{5 2}$. In summary, the results of the hydride addition reactions seem to indicate a finely balanced distribution of substrate conformations and, as a consequence, competing mechanistic pathways.

The potential of the above chemistry as a source of oxygenated $(Z, E)$-dienals is illustrated in Scheme 9, which shows how the diol $( \pm)$ - 34 e was transformed into the 6 -substituted $(2 Z, 4 E)$-dodecadienal $( \pm)$ - $53 .{ }^{31}$ The diol was monoprotected as the methoxybenzyl ether 54 , which was benzoylated under standard conditions to obtain the ester 55. Treatment of the ester 55 with DDQ gave the alcohol 56 , which was oxidised to obtain the ( $Z, E$ ) -dienal 53 in good yield $\left(>97 \%\right.$ isomeric purity by ${ }^{1} \mathrm{H}$ n.m.r.). The dienal $(R)$ - 53 has been prepared as a mixture of isomers using Wittig olefination reactions ( 13 steps from $L$-arabinose, $<2 \%$ yield). ${ }^{31}$

The intermediate aldehyde 57 was significantly more stable than the analogue 2 and the precursors of 13 , being directly observable among the products (by ${ }^{1} \mathrm{H}$ n.m.r. spectroscopy) when the alcohol 56 was oxidised with TPAP/NMO. Its persistence compared to 2 can be attributed, at least in part, to the diminished electron donor capability of the acyloxy (relative to the alkoxy) group, which will reduce the preference of the (oxy)alkyl substituent for 'outward' conrotation. ${ }^{3-5}$ Thus the activation barrier to electrocyclic ring-opening, which includes significant contributions from each of the conrotating (allylic) substituents according to its electronic properties, might be manipulated through judicious but essentially minor structural modifications.

SCHEME 9 (MPM $=4-\mathrm{MeOC}_{6} \mathrm{H}_{4} \mathrm{CH}_{2}$ ) Reagents: i, $\mathrm{NaH}, \mathrm{THF}, \mathrm{MPM}-\mathrm{Br}(86 \%$ ); ii, PhCOCl , pyridine (82\%); iii, DDQ, $\mathrm{CH}_{2} \mathrm{Cl}_{2}-\mathrm{H}_{2} \mathrm{O}, 20^{\circ} \mathrm{C}(89 \%)$; iv, oxalyl chloride, $\mathrm{Me}_{2} \mathrm{SO}, \mathrm{CH}_{2} \mathrm{Cl}_{2},-78{ }^{\circ} \mathrm{C}, 1$ $h$, then $\mathrm{Et}_{3} \mathrm{~N},-78$ to $20^{\circ} \mathrm{C},(72 \%)$; v, TPAP, NMO, $4 \AA$ sieves, $\mathrm{CH}_{2} \mathrm{Cl}_{2}, 0^{\circ} \mathrm{C}(75 \%)$.

In order to develop this methodology so that it could be used to prepare dienals such as 53 with absolute stereocontrol, we required access to both enantiomers of the lactone 4. Its racemic form was first obtained via a photochemical [2+2] cycloaddition, ${ }^{32}$ but is more conveniently obtained from the diol 1 (Scheme 7) or by reduction of the acid-ester ( $\pm$ )-58 ${ }^{3}$ with calcium borohydride. Applying this sequence (Scheme 10 , steps i-iii) to ( + )-58, which is available ( $86 \%$ e.e.) from the corresponding diester using pig liver esterase, ${ }^{33-35}$ offers one route to the lactone ( + )-4. The preparation of $(-)-4$ from the acid-ester $(+)-58$ (Scheme 10 ) is described in a patent, ${ }^{34}$ but the lactone (-)-4 reported in this work appears to have been wrongly assigned as $(1 S, 5 R) .{ }^{33}$

It has also been established that the meso-diacetate 59 can be desymmetrised by partial hydrolysis with Pseudomonas fluorescens lipase (PFL), generating the monoacetate ( + )- 60 ( $75 \%$ yield, $>97 \%$ e.e.). ${ }^{33}$ For the purpose of comparison a sample of ( $\pm$ )-60 was prepared by debenzylation of the MPM derivative ( $\mathbf{~}$ )-5b (cf. Scheme 2). The monoacetate ( + )- 60 was transformed into the ( $1 S, 5 R$ )-lactone ( + )-4 as shown in Scheme 10. Although our current procedure for oxidising 60 is not particularly efficient, the product ( + ) -4 is of high optical purity (e.e. $95 \%$ by g.l.c.). Moreover, we found that by using PFL in the transacetylation mode ${ }^{36}$ the diol 1 could be transformed directly into the monoacetate $(-)-60$, and hence the enantiomeric lactone $(-)-4$ (e.e. $88 \%$ ).

The availability of both enantiomers of the lactone 4 from the diol 1 renders accessible both enantiomeric series of ( $Z, E$ )-dienals such as 53 (Scheme 9) via a convenient and stereoselective reaction sequence, from the same achiral starting material and using the same enzyme. Further development and applications of this chemistry in the synthesis of biologically active polyenes are in progress and will be described in due course.

## EXPERIMENTAL

All compounds are racemic unless their names are preceded by appropriate stereochemical descriptors. Melting points were determined using an Electrothermal apparatus and are uncorrected. Unless otherwise stated, i.r. spectra were of thin films on sodium chloride plates, recorded on a Perkin-Elmer 1710FT spectrometer. N.m.r. spectra were measured on a Bruker AC300 instrument at $300 \mathrm{MHz}\left({ }^{1} \mathrm{H}\right)$ and $75.47 \mathrm{MHz}\left({ }^{13} \mathrm{C}\right)$ for solutions in deuteriochloroform with tetramethylsilane as the internal standard, unless otherwise indicated. Mass spectra were measured on a Finnegan 4500 (low resolution) or Kratos Concept S1 (high resolution) instruments using the ammonia CI method unless stated. Data for most of the peaks of intensity $<\mathbf{2 0 \%}$ of that of the base peak are omitted. U.v. spectra were recorded on a Pye-Unicam SP8 spectrophotometer. Optical rotations were measured at 589 nm using an AA-10 polarimeter (Optical Activity Ltd.).

Starting materials and solvents were routinely purified by conventional techniques. ${ }^{37}$ Organic solutions were dried using anhydrous magnesium sulphate and concentrated by rotary evaporation. Analytical thin layer chromatography (t.l.c.) was carried out on Camlab Polygram SIL G/UV 254 plates. The chromatograms were visualized by the use of u.v. light or the following developing agents; methanolic phosphomolybdic acid (PMA), ethanolic vanillin or potassium permanganate. Unless otherwise indicated, preparative (column) chromatography was carried out on 60 H silica gel (Merck 9385) or Florisil ( $60-100$ mesh) using the flash technique. ${ }^{38}$ Compositions of solvent mixtures are quoted as ratios of volume. 'Petroleum' refers to a light petroleum fraction, b.p. $40-60^{\circ} \mathrm{C}$, unless otherwise stated. 'Ether' refers to diethyl ether.

Method A: To a stirred solution of the diol $1^{3}(4.0 \mathrm{~g}, 35 \mathrm{mmol})$ and Celite ${ }^{\circledR} 521(20 \mathrm{~g})$ in dichloromethane ( 150 ml ) was added pyridinium chlorochromate ( $\mathrm{PCC} ; 22.6 \mathrm{~g}, 105 \mathrm{mmol}$ ), and the resulting brown mixture stirred at room temperature for 14 h . The mixture was then filtered, the solids washed with ether, and the combined organics evaporated. The brown residue was purified by flash chromatography (elution with dichloromethane - hexane 2:1) to give the title compound ( $\pm$ ) $-4(2.56 \mathrm{~g}, 67 \%)$ as a colourless oil, b.p. $60^{\circ} \mathrm{C}$ ( 0.6 mmHg ) (Found: $\mathrm{C}, 65.4 ; \mathrm{H}, 5.5 . \mathrm{C}_{6} \mathrm{H}_{6} \mathrm{O}_{2}$ requires $\mathrm{C}, 65.45 ; \mathrm{H}, 5.5 \%$ ) ( $\mathrm{M}+\mathrm{H}^{+}, 111.0440 ; \mathrm{C}_{6} \mathrm{H}_{7} \mathrm{O}_{2}$ requires 111.0446 ); $v_{\max } 2973,2908,1759,1373,1245,1169,1086,1052,983,913,867,823,774$ and $706 \mathrm{~cm}^{-1} ; \delta(300 \mathrm{MHz}) 3.52-3.57(2 \mathrm{H}, \mathrm{m}, 1-\mathrm{H}$ and $5-\mathrm{H}), 4.16-4.25\left(2 \mathrm{H}, \mathrm{m}, 4-\mathrm{H}_{2}\right), 6.23$ and 6.29 (each I $\mathrm{H}, \mathrm{d}, J 3 \mathrm{~Hz}, 6-\mathrm{H}$ and $7-\mathrm{H}) ; \mathrm{m} / \mathrm{z} 128\left(\mathrm{M}+\mathrm{NH}_{4}, 100 \%\right), 65(15) ; \mathrm{R}_{\mathrm{f}}$ (dichloromethane - ethyl acetate 4:1) $0.65, \mathrm{KMnO}_{4}$ stain.
Method B: To a stirred solution of the half-ester ( $\pm$ ) $-58^{3}(2.5 \mathrm{~g}, 16 \mathrm{mmol})$ in ethanol ( 75 ml ) at room temperature was added potassium hydroxide ( $0.9 \mathrm{~g}, 16 \mathrm{mmol}$ ). After 0.5 h powdered calcium chloride ( 4.56 $\mathrm{g}, 40 \mathrm{mmol}$ ) was added followed, dropwise, by a solution of sodium borohydride ( $1.55 \mathrm{~g}, 40 \mathrm{mmol}$ ) in 1 M $\mathrm{KOH}(19 \mathrm{ml})$. After 6 h the solution was acidified with 2 M hydrochloric acid ( 30 ml ) and stirred for a further 12 h . The ethanol was evaporated, the residual solution was extracted with dichloromethane ( $5 \times 25 \mathrm{ml}$ ), and the combined organics were washed with brine ( $2 \times 50 \mathrm{ml}$ ), dried and evaporated. Purification as for method A gave the lactone $( \pm)-4(1.23 \mathrm{~g}, 70 \%)$.
Method C: cis-3-Cyclobutene-1,2-dicarboxylic anhydride ${ }^{3}$ ( $2.0 \mathrm{~g}, 16 \mathrm{mmol}$ ) was added portionwise to a stirred suspension of lithium aluminium hydride ( $1.0 \mathrm{~g}, 26 \mathrm{mmol}$ ) in THF ( 25 ml ) under $\mathrm{N}_{2}$ at $0{ }^{\circ} \mathrm{C}$. The mixture was heated under reflux for 48 h , cooled to $0^{\circ} \mathrm{C}$, and the excess of reagent destroyed by the slow addition of 2 M aqueous potassium hydroxide ( 5 ml ). The suspension was stirred for 15 min and ether ( 50 ml ) then added. The resulting precipitate was filtered off and washed with several portions of ether, the filtrate was evaporated and the residue dissolved in dichloromethane ( 25 ml ), dried and evaporated. The combined organics were dried and evaporated to a brown residue which was dissolved in methanol ( 5 ml ). Sodium methoxide ( $168 \mathrm{mg}, \mathbf{3 . 0}$ mmol ) was added and the solution was stirred at room temperature for 3 h . The methanol was reduced in volume by evaporation and 2 M hydrochloric acid ( 10 ml ) was added. ## Reaction of $\mathbf{2 0}$ with Butylcopper Reagents (Table 1)

The chlorodiene 20 was treated with various butylcopper reagents as described below, with identical work-up procedures (as for entry 1). The ratio of dienes obtained in each reaction (Table 1) was estimated from the 300 $\mathrm{MHz}{ }^{1} \mathrm{H}$ n.m.r. spectrum of the crude product, integrating over the range $\delta 3.1-4.2 \mathrm{ppm}$. The signals due to the benzylic $\mathrm{CH}_{2}$ of each of the compounds 21-24 were clearly resolved within this region.
Entry 1: To a stirred solution of the cuprate ( 0.8 mmol ) at $-78^{\circ} \mathrm{C}$ under $\mathrm{N}_{2}$ [prepared by treatment of copper(I) iodide ( $152 \mathrm{mg}, 0.8 \mathrm{mmol}$ ) in THF ( 10 ml ) with $n$-butyllithium in hexane ( $1.3 \mathrm{M}, 1.31 \mathrm{ml}, 1.6 \mathrm{mmol}$ ) with stirring at $-10^{\circ} \mathrm{C}$ for 0.5 h ] was added a solution of $20(100 \mathrm{mg}, 0.4 \mathrm{mmol})$ in THF ( 5 ml ). After $1 \mathrm{~h} \mathrm{at}-78$ ${ }^{\circ} \mathrm{C}$ the solution was allowed to return to $-10^{\circ} \mathrm{C}$ and stirred for 2 h . Saturated ammonium chloride ( 10 ml ) was added, the mixture was extracted with ether ( $3 \times 15 \mathrm{ml}$ ), and the combined extracts washed with water ( $3 \times 15$ ml ), brine ( 20 ml ), dried and evaporated.

The residue was applied to a plug of silica, eluted with pentane, and the eluate carefully distilled off at atmospheric pressure to obtain the title compound $\mathbf{3 1}(13 \mathrm{mg}, 85 \%)$; $v_{\text {max }} 2967$, 1933, 2874, 2856, 2253, 1640, 1625, 1463, 1096, 1067, 1007 and $907 \mathrm{~cm}^{-1} ; \delta(300 \mathrm{MHz}) 0.95(3 \mathrm{H}, \mathrm{t}, J$ $\left.7.5 \mathrm{~Hz}, 8-\mathrm{H}_{3}\right), 2.16\left(2 \mathrm{H}, \mathrm{dq}, J_{6,7} 7.5, J_{7,8} 7.5 \mathrm{~Hz}, 7-\mathrm{H}_{2}\right), 5.02\left(1 \mathrm{H}, \mathrm{d}, J_{1}, 210.5 \mathrm{~Hz}, 1^{\prime}-\mathrm{H}\right), 5.15(1 \mathrm{H}$, d, $\left.J_{1,2} 16.5 \mathrm{~Hz}, 1-\mathrm{H}\right), 5.42\left(1 \mathrm{H}, \mathrm{dt}, J_{6,7} 7.5, J_{5,6} 11 \mathrm{~Hz}, 6-\mathrm{H}\right), 5.93\left(1 \mathrm{H}, \mathrm{t}, J_{5,6} 11, J_{4,5} 11 \mathrm{~Hz}, 5-\mathrm{H}\right)$, $6.15\left(1 \mathrm{H}, \mathrm{dd}, J_{2,3} 10.5, J_{3,4} 14.5 \mathrm{~Hz}, 3-\mathrm{H}\right), 6.35\left(1 \mathrm{H}\right.$, ddd, $\left.J_{1^{\prime}, 2} 10.5, J_{2,3} 10.5, J_{1,2} 16.5 \mathrm{~Hz}, 2-\mathrm{H}\right)$ and $6.45\left(1 \mathrm{H}, \mathrm{dd}, J_{4,5} 11, J_{3,4} 14.5 \mathrm{~Hz}, 4-\mathrm{H}\right)$ (the assignments for $3-\mathrm{H}$ and $4-\mathrm{H}$ are tentative and may be reversed); $\lambda_{\max }$ (hexane) $253,263,273 \mathrm{~nm}$.

## General procedure for the in situ reaction of the lactol 32 with organometallic reagents (Table 2)

A stirred solution of the lactone $( \pm)-4(110 \mathrm{mg}, 1.0 \mathrm{mmol})$ in THF $(5 \mathrm{ml})$ at $-78^{\circ} \mathrm{C}$ under $\mathrm{N}_{2}$ was treated with a solution of DIBAH in hexane $(1.0 \mathrm{M}, 1.0 \mathrm{ml}, 1.0 \mathrm{mmol})$. The reaction mixture was stirred at $-78{ }^{\circ} \mathrm{C}$ for 1 h and then treated with the additive (if any), and then the organometallic reagent ( 3 mol equiv.). After a further 1 h at $-78^{\circ} \mathrm{C}$ the mixture was allowed to warm to room temperature over 1 h and stirred at room temperature to ensure completion (typically 1 h ). The reaction mixture was cooled to $0^{\circ} \mathrm{C}$, quenched with 1 M hydrochloric acid $(20 \mathrm{ml})$, saturated with NaCl and extracted with ether ( $3 \times 20 \mathrm{ml}$ ). The combined extract was washed with brine ( 20 ml ), dried and evaporated. The residue was analysed by $300 \mathrm{MHz}{ }^{1} \mathrm{H}$ n.m.r. spectroscopy to determine the composition of the reaction mixture and the products then isolated by tlash chromatography (elution with ethyl acetate - dichloromethane mixtures as required). See Table 2 for product ratios and yields. The minor products 35b and 35c were evident in n.m.r. spectra but were not fully characterised.

To a stirred solution of the ketone $40(364 \mathrm{mg}, 1.0 \mathrm{mmol})$ in acetonitrile ( 3 ml ) at room temperature was added a solution of aqueous hydrofluoric acid $(40 \% \mathrm{HF} ; 0.1 \mathrm{ml})$ in acetonitrile ( 5 ml ). After 1 h the mixture was concentrated in vacuo and purified by chromatography (elution with dichloromethane - ether $2: 1$ ), which gave the title compound 38 as a 1:3 mixture with the 2-methyl-3-oxabicyclo[3.2.0]hept-6-en-2-ols 42 (total 79 mg , $63 \%$ ). ## General procedure for reductions of the ketones 38-40 (Table 3)

Method A (entries 1-6): A stirred solution of the ketone $38(25 \mathrm{mg}, 0.2 \mathrm{mmol})$ in THF or ether ( 2 ml ) at -78 ${ }^{\circ} \mathrm{C}$ under $\mathrm{N}_{2}$ was treated with the additive ( 0.2 mmol ) (if any) followed, after 2 h , with the reducing agent ( 3 mol equiv.). After a further 4 h at $-78^{\circ} \mathrm{C}$ the mixture was allowed to warm up to room temperature and stirred until the reaction was complete (typically overnight). The reaction mixture was cooled to $0^{\circ} \mathrm{C}$ and treated with 2 M hydrochloric acid ( 3 ml ), saturated with NaCl and extracted with ether ( $3 \times 5 \mathrm{ml}$ ). The combined extract was washed with brine ( 5 ml ), dried and evaporated. The residue was analyzed by $300 \mathrm{MHz}{ }^{1} \mathrm{H}$ n.m.r. spectroscopy to determine the composition of the reaction mixture (see Table 3 for product ratios and yields). The products were resolved by chromatography (elution with dichloromethane - ethyl acetate 10:1). The data for 34a and 35a are given above. The procedure for run 3 was as above but the solvent was methanol and the reaction was carried out at room temperature. The procedure for run 6 was as follows: To a stirred solution of the ketone $38(25 \mathrm{mg}, 0.2 \mathrm{mmol})$ in THF ( 2 ml ) at room temperature was added sodium triacetoxyborohydride $(212 \mathrm{mg}, 1.0 \mathrm{mmol}$ ). After stirring for 4 d the solvent was removed by evaporation, brine ( 5 ml ) was added
and the mixture extracted with dichloromethane ( $5 \times 5 \mathrm{ml}$ ). The combined extract was dried, evaporated and analysed as above.
Method B (entries 7-10): A stirred solution of ketone 39 ( $25 \mathrm{mg}, 0.1 \mathrm{mmol}$ ) in THF ( 1 ml ) at - $78^{\circ} \mathrm{C}$ under $\mathrm{N}_{2}$ was treated with the reducing agent ( 3 equiv.). After 2 h at $-78^{\circ} \mathrm{C}$ the mixture was allowed to warm to $0{ }^{\circ} \mathrm{C}$ over a further 2 h , quenched with 2 M hydrochloric acid ( 3 ml ), saturated with NaCl and extracted with ether ( 3 $\times 5 \mathrm{ml}$ ). The combined extract was washed with brine ( 5 ml ), dried and evaporated. The residue was analysed and resolved as for method A.
Method C (entry 11): To a stirred solution of 39 ( $12 \mathrm{mg}, 0.05 \mathrm{mmol}$ ) in THF ( 1 ml ) at $-78^{\circ} \mathrm{C}$ under Ar was added a solution of potassium tris(sec-butyl)borohydride (K-selectride) in THF ( $1.0 \mathrm{M} ; 0.1 \mathrm{ml}, 0.1 \mathbf{~ m m o l}$ ). The reaction mixture was maintained at $-78^{\circ} \mathrm{C}$ for 2 h and then allowed to stir at room temperature for 0.5 h . Aqueous sodium hydroxide ( $10 \% ; 2 \mathrm{ml}$ ) was added and the mixture was extracted with ether ( $3 \times 10 \mathrm{ml}$ ). The combined extracts were washed with brine, dried, and evaporated. The residue was analysed as for method A. Method D (entry 12): To prepare $\left.0.1 \mathrm{M} \mathrm{Zn(BH}_{4}\right)_{2}$ in ether, ${ }^{39}$ a stirred suspension of sodium borohydride ( $37.8 \mathrm{mg}, 1.0$ mole) in ether ( 4.5 ml ) under Ar was treated with a solution of zinc chloride in ether ( $1.0 \mathrm{M}, 0.5$ $\mathrm{ml}, 0.5 \mathrm{mmol})$. The mixture was stirred at room temperature for 3 h and left standing until the precipitation of white solid had ceased. The supernatant was used for the following reduction step. To a stirred solution of 39 ( $12 \mathrm{mg}, 0.05 \mathrm{mmol}$ ) in ether ( 1 ml ) at $0^{\circ} \mathrm{C}$ under Ar was added the solution of zinc borohydride in ether ( 0.1 $\mathrm{M}, 1.0 \mathrm{ml}, 0.1 \mathrm{mmol}$ ). The reaction mixture was maintained at $0{ }^{\circ} \mathrm{C}$ for 1.5 h and then quenched with saturated aqueous ammonium chloride ( 2 ml ). After stirring at $0^{\circ} \mathrm{C}$ for 10 min , the mixture was extracted with ether ( $3 \times 10 \mathrm{ml}$ ) and the combined extracts washed with brine, dried, and evaporated. The residue was analysed as for method $A$.
Method E (entries 13-19): A stirred solution of ketone $\mathbf{4 0}$ ( $36 \mathrm{mg}, 0.2 \mathrm{mmol}$ ) in THF ( 3 ml ) at $-78{ }^{\circ} \mathrm{C}$ under $\mathrm{N}_{2}$ was treated with the additive ( 0.2 mmol ) (if any), and after 1 h the reducing agent ( 3 mol equiv.). After a further 2 h at $-78^{\circ} \mathrm{C}$ the mixture was allowed to warm to $0^{\circ} \mathrm{C}$, quenched with 2 M hydrochloric acid ( 5 ml ), saturated with NaCl and extracted with ether ( $3 \times 5 \mathrm{ml}$ ). The combined extract was washed with brine ( 5 ml ), dried and evaporated. The products were isolated by chromatography (elution with petroleum - ether 10:1), which gave $1 \mathrm{~S}^{*}, 1 \mathrm{R}^{*}, 4^{\prime} \mathrm{S}^{*}-4-(\mathrm{t}$-butyldiphenylsilyloxy)methyl-2-cyclobutene-1-ethanol 46 as a colourless oil $\left(\mathrm{M}+\mathrm{H}^{+}, 367.2085 ; \mathrm{C}_{23} \mathrm{H}_{31} \mathrm{O}_{2} \mathrm{Si}\right.$ requires 367.2093); $\mathrm{v}_{\text {max }}\left(\mathrm{CDCl}_{3}\right) 3478,3071,3048,2963,2931,2893$, $2859,1740,1590,1472,1446,1428,1392,1369,1299,1113,1064,1035,1007,999,823,807,740$ and $720 \mathrm{~cm}^{-1} ; \delta(300 \mathrm{MHz}) 1.04\left(9 \mathrm{H}, \mathrm{s}, \mathrm{CMe}_{3}\right), 1.25\left(3 \mathrm{H}, \mathrm{d}, J 6 \mathrm{~Hz}, 2-\mathrm{H}_{3}\right), 2.97\left(1 \mathrm{H}, \mathrm{dd}, J_{1 ; 4} 3.5, J_{1,1}\right.$ $\left.10 \mathrm{~Hz}, 1^{\prime}-\mathrm{H}\right), 3.16-3.22\left(1 \mathrm{H}, \mathrm{m}, 4^{\prime}-\mathrm{H}\right), 3.77-3.86\left(2 \mathrm{H}, \mathrm{m}, 1^{\prime \prime}-\mathrm{H}_{2}\right), 3.93-4.02(1 \mathrm{H}, \mathrm{m}, 1-\mathrm{H}), 4.56(1 \mathrm{H}$, s, OH ), 5.83 and 6.00 (each $1 \mathrm{H}, \mathrm{d}, J 3 \mathrm{~Hz}, 2^{\prime}-\mathrm{H}$ and $\left.3^{\prime}-\mathrm{H}\right), 7.35-7.46$ and $7.67-7.70(10 \mathrm{H}, 2 \times \mathrm{m}, 2 \times$ $\left.\mathrm{C}_{6} \mathrm{H}_{5}\right) ; \mathrm{m} / \mathrm{z} 384\left(\mathrm{M}+\mathrm{NH}_{4}, 48 \%\right), 367(\mathrm{M}+\mathrm{H}, 100), 274(15) ; \mathrm{R}_{\mathrm{f}}$ (petroleum - ether 8:1) $0.45, \mathrm{KMnO}_{4}$ stain. The reaction mixture was maintained at $-78^{\circ} \mathrm{C}$ for a further 2 h and then treated with triethylamine ( 243 mg , 2.4 mmol ). After a further 15 min at $-78^{\circ} \mathrm{C}$ the mixture was allowed to warm up to room temperature over 45 min. The solution was washed with water ( 10 ml ), brine $(10 \mathrm{ml})$, dried, evaporated and the residue washed through a short column of Florisil (elution with dichloromethane) to obtain the title compound $( \pm)$ - 53 ( 108 mg , $72 \%$ ) as a pale yellow oil ( $\mathrm{M}+\mathrm{NH}_{4}{ }^{+}, 318.2059 ; \mathrm{C}_{19} \mathrm{H}_{28} \mathrm{NO}_{3}$ requires 318.2069 ); $\mathrm{v}_{\max } 2930,2858,1718$, $1674,1644,1452,1315,1271,1111,912,734$ and $713 \mathrm{~cm}^{-1} ; \delta(300 \mathrm{MHz}) 0.83\left(3 \mathrm{H}, \mathrm{t}, J 7 \mathrm{~Hz}, 12-\mathrm{H}_{3}\right)$, $1.15-1.53\left(8 \mathrm{H}, \mathrm{m}, 8-\mathrm{H}_{2}, 9-\mathrm{H}_{2}, 10-\mathrm{H}_{2}, 11-\mathrm{H}_{2}\right), 1.70-1.86\left(2 \mathrm{H}, \mathrm{m}, 7-\mathrm{H}_{2}\right), 5.62\left(1 \mathrm{H}, \mathrm{dt}, \mathrm{J}_{5.6} 6, J_{6,7} 6\right.$ $\mathrm{Hz}, 6-\mathrm{H}), 5.86\left(1 \mathrm{H}, \mathrm{dd}, J_{1,2} 8, J_{2,3} 11 \mathrm{~Hz}, 2-\mathrm{H}\right), 6.14\left(1 \mathrm{H}, \mathrm{dd}, J_{5.6} 6, J_{4,5} 15 \mathrm{~Hz}, 5-\mathrm{H}\right), 6.91(1 \mathrm{H}, \mathrm{dd}$, $\left.J_{2,3} 11, J_{3,4} 11 \mathrm{~Hz}, 3-\mathrm{H}\right), 7.23\left(1 \mathrm{H}, \mathrm{dd}, J_{3,4} 11, J_{4,5} 15 \mathrm{~Hz}, 4-\mathrm{H}\right), 7.38-7.60(3 \mathrm{H}, \mathrm{m}, 3,4,5-\mathrm{ArH})$, $7.95-8.06(2 \mathrm{H}, \mathrm{m}, 2,6-\mathrm{ArH}), 10.14\left(1 \mathrm{H}, \mathrm{d}, \mathrm{J}_{1,2} 8 \mathrm{~Hz}, 1-\mathrm{H}\right) ; \mathrm{m} / \mathrm{z} 318\left(\mathrm{M}+\mathrm{NH}_{4}, 100 \%\right), 301(\mathrm{M}+\mathrm{H}$, 12), 198 (72), 179 (90), 105 (56).

Method B: To a stirred of the alcohol 56 ( $151 \mathrm{mg}, 0.5 \mathrm{mmol}$ ) in dichloromethane ( 5 ml ) at $0^{\circ} \mathrm{C}$ under $\mathrm{N}_{2}$ was added NMO ( $175 \mathrm{mg}, 1.5 \mathrm{mmol}$ ), powdered $4 \AA$ sieves ( 200 mg ) and TPAP ( $35 \mathrm{mg}, 0.1 \mathrm{mmol}$ ). After stirring for 0.5 h the mixture was washed through a short column of Florisil (elution with dichloromethane), giving a pale yellow oil ( $112 \mathrm{mg}, 75 \%$ ) whose $300 \mathrm{MHz}{ }^{1} \mathrm{H} \mathrm{n.m.r} \mathrm{spectrum} \mathrm{indicated} \mathrm{that} \mathrm{it} \mathrm{was} \mathrm{a} 1:$.1 mixture of the dienal 53 and the cyclobutenealdehyde 57. After 1 h a new $300 \mathrm{MHz}{ }^{1} \mathrm{H}$ n.m.r. spectrum of the product indicated that the conversion of 57 into 53 was complete.

## cis-3-Cyclobutene-1,2-dimethanol diacetate 59

A mixture of the diol $1(684 \mathrm{mg}, 6.0 \mathrm{mmol})$, acetic anhydride ( $1.32 \mathrm{~g}, 13 \mathrm{mmol}$ ) and pyridine ( 1.5 ml ) was stirred at room temperature for 6 h . Saturated aqueous sodium hydrogen carbonate ( 25 ml ) was added and the mixture extracted with dichloromethane ( $3 \times 25 \mathrm{ml}$ ). The combined organic solution was washed with 1 M hydrochloric acid ( $2 \times 25 \mathrm{ml}$ ), water ( 25 ml ), brine ( 25 ml ), dried and evaporated. Chromatography of the residue (elution with dichloromethane - ethyl acetate $4: 1$ ) gave the title compound $59(1.08 \mathrm{~g}, 91 \%)$ as a colourless oil ( $\mathrm{M}+\mathrm{NH}_{4}{ }^{+}, 216.1231 ; \mathrm{C}_{10} \mathrm{H}_{18} \mathrm{NO}_{4}$ requires 216.1236); $v_{\text {max }} 3300,3050,2956,2909,1827$, 1735, 1451, 1386, 1366, 1236, 1124, 1035, 975 and $741 \mathrm{~cm}^{-1} ; \delta(300 \mathrm{MHz}) 1.95(6 \mathrm{H}, \mathrm{s}, 2 \times \mathrm{COMe})$, 3.12-3.18 ( $2 \mathrm{H}, \mathrm{m}, \mathrm{l}^{\prime}-\mathrm{H}$ and $\left.4^{\prime}-\mathrm{H}\right), 4.10-4.12\left(4 \mathrm{H}, \mathrm{m}, 1-\mathrm{H}_{2}\right.$ and $\left.\mathrm{l}^{\prime \prime}-\mathrm{H}_{2}\right), 6.02\left(2 \mathrm{H}, \mathrm{s}, 2^{\prime}-\mathrm{H}\right.$ and $\left.3^{\prime}-\mathrm{H}\right) ; \mathrm{m} / \mathrm{z}$ $216\left(\mathrm{M}+\mathrm{NH}_{4}, 100 \%\right) ; \mathrm{R}_{\mathrm{f}}$ (dichloromethane - ethyl acetate $2: 1$ ) $0.8, \mathrm{KMnO}_{4}$ stain.
cis-3-Cyclobutene-1,2-dimethanol monoacetate ( $\pm$ )- 60
Method A: A mixture of the diol $1(450 \mathrm{mg}, 3.95 \mathrm{mmol})$, acetic anhydride ( $405 \mathrm{mg}, 3.95 \mathrm{mmol}$ ) and pyridine ( $315 \mathrm{mg}, 3.95 \mathrm{mmol}$ ) was stirred at room temperature for 3 h . Saturated aqueous sodium hydrogen carbonate $(10 \mathrm{ml})$ was added and the mixture extracted with dichloromethane $(3 \times 10 \mathrm{ml})$. The combined organic solution was washed with 1 M hydrochloric acid ( $2 \times 15 \mathrm{ml}$ ), water ( 15 ml ), brine ( 15 ml ), dried and evaporated. Chromatography of the residue (elution with dichloromethane - ethyl acetate 4:1) gave first the diacetate 59 (186 $\mathrm{mg}, 24 \%$ ), followed by the title compound ( $\pm$ )- $60(298 \mathrm{mg}, 44 \%)$ as a colourless oil ( $\mathrm{M}+\mathrm{H}^{+}, 157.0870$; $\mathrm{C}_{8} \mathrm{H}_{13} \mathrm{O}_{3}$ requires 157.0865); $v_{\text {max }} 3450 \mathrm{br}, 2955,1733,1438,1280,1112,1033$ and $740 \mathrm{~cm}^{-1} ; \delta(300 \mathrm{MHz})$ $2.00(3 \mathrm{H}, \mathrm{s}, \mathrm{MeCO}), 2.68(1 \mathrm{H}, \mathrm{br} \mathrm{s}, \mathrm{OH}), 3.09-3.20\left(2 \mathrm{H}, \mathrm{m}, 1^{\prime}-\mathrm{H}\right.$ and $\left.4^{\prime}-\mathrm{H}\right), 3.68(2 \mathrm{H}, \mathrm{d}, J 7 \mathrm{~Hz}, 1-$ $\mathrm{H}_{2}$ ), $4.10\left(1 \mathrm{H}, \mathrm{dd}, J_{1 " .4} 8.5, J_{\mathrm{gem}} 11.5 \mathrm{~Hz}, 1^{1 "-H}\right), 4.27\left(1 \mathrm{H}, \mathrm{dd}, J_{1^{\prime} .4^{4}} 6, J_{\mathrm{gem}} 11.5 \mathrm{~Hz}, 1^{\prime \prime}-\mathrm{H}\right), 6.04$ and 6.07 (each $1 \mathrm{H}, \mathrm{d}, J 2.5 \mathrm{~Hz}, 2^{\prime}-\mathrm{H}$ and $\left.3^{\prime}-\mathrm{H}\right) ; \mathrm{m} / \mathrm{z} 174\left(\mathrm{M}+\mathrm{NH}_{4}, 100 \%\right), 157(\mathrm{M}+\mathrm{H}, 12 \%) ; \mathrm{R}_{\mathrm{f}}$ (dichloromethane - ethyl acetate 2:1) $0.4, \mathrm{KMnO}_{4}$ stain.
Method B: To a stirred solution of the ester-ether ( $\pm$ )- 5 b ( $138 \mathrm{mg}, 0.5 \mathrm{mmol}$ ) in a mixture of dichloromethane $(5 \mathrm{ml})$ and water $(0.1 \mathrm{ml})$ was added a solution of $\operatorname{DDQ}(136 \mathrm{mg}, 0.6 \mathrm{mmol})$ in dichloromethane $(5 \mathrm{ml})$. After stirring at room temperature for 3 h , t.l.c. indicated that the starting material had been consumed. The mixture was dried with magnesium sulphate, filtered, and the residue washed with dichloromethane. The filtrate was evaporated to dryness, and the residue passed through a short plug of Florisil, eluting with ether ( 50 ml ). Evaporation of the ether and chromatography of the residue, eluting with ethyl acetate - dichloromethane (1:9), gave 4-methoxybenzaldehyde ( 66 mg ), followed by the title compound $( \pm)-60(71 \mathrm{mg}, 91 \%)$, which was identical to the material prepared by method A .

## (+)-cis-3-Cyclobutene-1,2-dimethanol monoacetate $(+)-60^{33}$

To a stirred solution of the diacetate $59(980 \mathrm{mg}, 5.0 \mathrm{mmol})$ in phosphate buffer $(\mathrm{pH} 7.0,20 \mathrm{ml})$ at room temperature was added Pseudomonas fluorescens lipase ( 20 mg ). The pH was maintained by addition of 0.5 $M$ sodium hydroxide and after the addition of 0.8 mol equivalents of alkali ( 18.5 h ), the mixture was extracted with dichloromethane ( $3 \times 50 \mathrm{ml}$ ). The aqueous layer was saturated with sodium chloride and extracted with more dichloromethane ( $2 \times 20 \mathrm{ml}$ ). The combined extracts were dried and evaporated, and the residue was chromatographed to obtain the title compound $(+)-60(476 \mathrm{mg}, 61 \%)$ as a colourless oil, with spectroscopic data as for the racemic compound ( $\pm$ )-60; $[\alpha]_{D}{ }^{20}+8.5^{\circ}(c 2.0$, chloroform).
(-)-cis-3-Cyclobutene-1,2-dimethanol monoacetate (-)-60
To a stirred solution of Pseudomonas fluorescens lipase ( 100 mg ) and vinyl acetate ( 10 ml ) at room
temperature under $\mathrm{N}_{2}$ was added the diol 1 ( $560 \mathrm{mg}, 5.0 \mathrm{mmol}$ ). After 2 h the enzyme was removed by filtration and washed with vinyl acetate ( 10 ml ). The filtrate was evaporated and the residue chromatographed (elution with dichloromethane - ethyl acetate $4: 1$ ) to obtain the title compound ( - )-60 ( $750 \mathrm{mg}, 96 \%$ ) as a colourless oil, with spectroscopic data as for the racemic compound ( $\pm$ ) $-60 ;[\alpha]_{D^{20}}-7.5^{\circ}$ (c 2.0, chloroform).

## (1S,5R)-3-Oxabicyclo[3.2.0]hept-6-en-2-one (+)-4

The monoacetate (+)-60 ( $156 \mathrm{mg}, 1.0 \mathrm{mmol}$ ) was converted into the lactone 4 as described above for the preparation of $( \pm)-4$ (method E). Flash chromatography (elution with dichloromethane - hexane $2: 1$ ) gave the title compound ( + )-4 ( $52 \mathrm{mg}, 47 \%$ ) as a colourless oil, spectroscopically identical to the racemate ( $\pm$ )-4. Analysis by g.l.c. indicated that the enantiomer ratio (-):(+) was $2.48: 97.52$ ( $95 \%$ e.e.). G.l.c. conditions: Chiraldex B-TA column, $50 \mathrm{mx} 0.25 \mathrm{~mm}, 130^{\circ} \mathrm{C}$ isothermal, FID temperature $300^{\circ} \mathrm{C}$, injector temperature 200 ${ }^{\circ} \mathrm{C}, \mathrm{H}_{2}$ carrier gas, 20 psi . Retention times: (-)-4, $9.4 \mathrm{~min} ;(+)-4,12.1 \mathrm{~min}$.

## (1R,5S)-3-Oxabicyclo[3.2.0]hept-6-en-2-one (-)-4

The procedure described above for the preparation of $(+)-4$ was repeated using the monoacetate ( - )-60 (156 $\mathrm{mg}, 1.0 \mathrm{mmol}$ ), and gave the title compound ( - ) $-4(45 \mathrm{mg}, 41 \%$ ) as a colourless oil. Analysis by g.l.c. as described for $(+)-4$ indicated that the enantiomer ratio $(-):(+)$ was $94.2: 5.8$ (88.4\% e.e.).

( $2 Z, 4 E$ )-Dienals [ $\delta c a .10 .2 \mathrm{ppm}, \mathrm{CHO}$ ] were the only ( $Z, E$ )-isomers detected in the ring-opened products. Isomerisation to the more stable ( $2 E, 4 E$ )-isomers [ $\delta c a .9 .5 \mathrm{ppm}, \mathrm{CHO}$ ], which is catalysed by acid, appeared to be the only source of contamination.
