The reaction of 1-ethynyl-2-vinyl-3,4-dihydronaphthalenes and 1-ethynyl-2-vinylnaphthalenes over  $\operatorname{RuCl}_2(p$ -cymene) PPh<sub>3</sub> leads to 9,10-dihydrophenanthrenes and phenanthrenes in those cases where the ethynyl group in the substrates carries a terminal proton. When 1-phenylethynyl-2-vinyl-3,4-dihydronaphthalenes or 1-phenylethynyl-2-vinylnaphthalenes are reacted over Pt(PPh<sub>3</sub>)<sub>4</sub>, 1-methylene-1*H*-benz[*e*]-4,5-dihydroindenes and 1-methylene-1*H*-benz[*e*]indenes are formed.

While ene-diyne cyclisations (Bergman reaction) have been subject to extensive investigations,1-4 diene-yne cyclisations have been studied much less frequently (Scheme 1). In contrast to ene-diynes, the geometry of diene-ynes is far from optimal for intramolecular cyclisation reactions. Thus, cyclisations of this type can only be accomplished when the geometry of the transition state is greatly changed from that of the educts. Nevertheless, it is possible to submit dieneynes thermally to intramolecular cyclisation reactions. Thus, the parent compound, hexa-1,3-dien-5-yne (2, R = H) can be transformed to benzene at 274°C (Hopf cyclisation, Scheme 1)5 and at 500 °C, the reaction gives benzene in 50% yield.<sup>5</sup> Further diene-ynes have been subjected to similar conditions to furnish cyclisation products.<sup>6-11</sup> In certain cases, one or both olefinic moieties of the diene component can be part of an aromatic system. In these cases the Hopf cyclisation has been used for the construction of bowl-shaped polycyclic aromatic hydrocarbons (PAHs)<sup>6,7,8</sup> as sub-units of fullerenes. Efforts have been devoted to the elucidation of the mechanism of the thermal cyclisation of diene-ynes<sup>12-16</sup> and it has been found that different mechanisms compete, depending

on the reaction temperature. At lower temperatures, up to 550°C, the cyclisations are thought to occur through a twostep mechanism via cyclohexa-1,2,4-trienes B with a strong biradical character. At higher temperatures, it has been found that an isomerisation of the alkynes to vinylidenecarbenes D occurs, which then react by a 1,6-CH insertion (Scheme 1). Competing 1,5-CH insertion can yield indenes and acenaphthenes as side-products,<sup>17</sup> depending on the substrates. A fulvene structure has also been isolated as side product,<sup>15</sup> most likely arising via a biradical intermediate. As the thermal diene-yne cyclisations, mentioned above, all necessitate high temperatures, most functional groups are not compatible with the reaction conditions. Thus, milder reaction conditions are preferable with lower reaction temperatures as found in the cyclisation reactions of yne-ene allenes 4 to benzenes 5 (Myers-Saito-cyclisation, Scheme 2)<sup>18,19</sup> and to fulvenes 6 (Schmittel cyclisation, Scheme 2).20 In the case of terminal acetylenes such as 7, the cyclisation of diene-ynes can proceed via transformation of a metal vinylidene species, e.g. via G (vide infra) (Scheme 3). Here, the use of ruthenium<sup>21,22</sup> (Scheme 3) and tungsten,<sup>23-25</sup> and with less favourable results,

Thermal cyclisation of yne-ene-allenes (Myers-Saito-cyclisation)

of chromium and molybdenum catalysts has been reported. In the case of diene-ynes with internal acetylene moieties, the complexation of a metal to the alkyne moiety in  $\eta^2$ -fashion<sup>26,27</sup> as in **10** can be envisaged (Scheme 3). This would give a unit possessing more of the character and geometry of an alkene allowing subsequent cyclisation of the complexed diene-yne. We have recently developed a one-pot synthesis of 1-ethynyl-2-vinyl-3,4-dihydronaphthalenes **15** from 1-bromo-2-formyl-3,4-dihydronaphthalenes **14**,<sup>28</sup> and we became interested in their metal catalysed yne-diene cyclisation reactions, utilising both of the latter approaches.

Tetralones such as 13 can easily be transformed into the corresponding bromo-enaldehydes, such as 14, by the Arnold-Vilsmeier reaction (Scheme 4).<sup>29</sup> The bromo-enaldehydes 14 can then react in a one-pot Sonogashira-coupling-Wittig reaction to furnish 1-ethynyl-2-vinyl-3,4-dihydronaphthalenes 15a, c,  $d^{28}$  and, after desilyation with tetra-*n*-butylammonium fluoride (TBAF) in wet THF, to give 15b and 15e. 1-Ethynyl-2-vinylnaphthalene (15f) was synthesised from 15a, either by desilylation to 15b (TBAF, wet THF) and subsequent dehydration with 2,3-dicyano-4,5-dichloroparabenzoquinone (DDQ) in refluxing benzene, or by dehydration of 15a to 15g

with DDQ in refluxing toluene and subsequent desilylation using TBAF in wet THF (Scheme 5). Compound **15i** was prepared from **15e** by Luche reduction (NaBH<sub>4</sub>, CeCl<sub>3</sub>) followed by acetylation (Ac<sub>2</sub>O, Py) (Scheme 6). It is necessary to protect the hydroxy group in **15h** for the subsequent dieneyne cyclisation.

The resultant 1-ethynyl-2-vinyldihydronaphthalenes **15b**, **15e**, and **15i** and 1-ethynyl-2-vinylnaphthalene **15f** were subjected to metal-catalysed diene-yne cyclisation reactions. While Iwasawa and Maeyama<sup>23,24</sup> have shown that dieneynes, possessing a terminal proton, can be cyclised in presence of W(CO)<sub>5</sub>(THF), in the present case, Ru(*p*-cymene)  $Cl_2PPh_3^{30}$  was used as the catalyst, as described by Merlic and Pauly.<sup>21</sup> In this manner, diene-ynes **15b**, **15e**, **15f**, and **15i** were cyclised in fair yield to give a ready access to arenoannelated compounds **16a–d** (Scheme 6). The reaction is thought to proceed via a ruthenium vinylidene intermediate (see Scheme 3).<sup>21</sup>

Recently, Fuerstner and Mamane<sup>31</sup> described the Ptcatalysed cyclisation of 2-ethynylbiphenyls to phenanthrenes, which incorporates aspects of the diene-yne cyclisation. Initial experiments on the cyclisation of dihydronaphthalene based diene-ynes of type 15 with Pt(PPh<sub>3</sub>)<sub>4</sub> as catalyst, however, gave the corresponding phenanthrenes as the cyclised product in very poor yield (typically: Pt(PPh<sub>3</sub>)<sub>4</sub>, mesitylene, 135 °C, 45 h, 2% yield). It must be noted, however, that the cyclisation of 15b to 16a also proceeds in the presence of platinum dichloride. Here, platinum dichloride was immobilised on a solid support (carbon nanofibres, CNFs).<sup>32</sup> Higher reaction temperatures

were needed (74°C vs 40°C) than in the ruthenium catalysed transformation of 15b to 16a, when 1,1,1-trichloroethane was used as solvent (Scheme 6). While initially a  $\eta^2$ -complexation of the platinum species to the alkyne moiety was taken into consideration when planning the reaction sequence (vide supra), it may well be that a metal vinylidene intermediate is also active in this catalytic reaction. Such end-on complexations have been discussed in the absorption of acetylene itself on Pt-surfaces, where the upright bridge bonded µ-vinylidene of the form Pt<sub>2</sub> =C=CH<sub>2</sub> has been characterised by vibrational spectroscopy.33 Laser ablated Pt atoms have also been found to react with acetylene to form platinum vinylidene (Pt =C=CH<sub>2</sub>).<sup>34</sup> It has been known that noble metals on solid supports can go into solution and redeposit on the support, so that even for solid supported catalysts of this type a homogeneous reaction can be considered.35

Compound 16a can be derivatised<sup>36</sup> to two potent inhibitors of human steroid  $5\alpha$ -reductase.<sup>37,38</sup> Thus, 16a can be hydrolysed to inhibitor 16a–H with KOBut/H<sub>2</sub>O in ether according to a general procedure by Gassman (Scheme 6).<sup>39</sup> It can also be dehydrogenated to 16c, the direct precursor of potent steroid  $5\alpha$ -reductase inhibitor phenanthrene-2carboxylate. Alternatively, 16c can be prepared by diene-yne cyclisation from 15f.

Next, we turned our attention to diene-ynes with an internal alkyne unit, in which 1-arylethynyl-2-vinyl-3,4-dihydronaphthalenes 15 were used as substrates. Again, the compounds can be prepared by a one-pot or by a stepwise Sonogashira–Wittig olefination (Schemes 4 and 7).

A number of platinum complexes and platinum salts were used in the initial attempts at diene-yne cylisation of these substrates. When tetrakis(triphenylphosphine)platinum(0) [Pt(PPh<sub>3</sub>)<sub>4</sub>] was added to **15c** in CD<sub>2</sub>Cl<sub>2</sub>, a platinum complex was formed, which could be characterised by <sup>1</sup>H and <sup>13</sup>C NMR spectroscopy, but which could not be identified unequivocally. This platinum complex did not react further and give cyclised products under the conditions tried (DMF, rt; DMF, 80°C; DMF, reflux; dry thermolysis on quartz [350°C; p < 10 Torr]). However, the reaction of **15c** in mesitylene at 135°C in the

Scheme 7

Scheme 8

presence of  $Pt(PPh_3)_4$  led to a reddening of the solution and 1-methylene-1*H*-benz[*e*]-4,5-dihydroindenes 18*a* was isolated in moderate yield (Scheme 8).

The fulvenes form as a mixture of E- and Z-isomers, where the Z-isomer is the predominant isomer. In the Z-isomers, the protons of the benzo- as well as the phenyl group are shifted to high-field due to the proximity of the two aromatic ring systems. The stereostructure of the E-isomer was confirmed by NOE experiments. Over prolonged periods of time, the pure Z-isomer equilibrates in solution to give a mixture of *E*- and *Z*-isomer. Neat *Z*-isomers, *e.g.* **18b**, have been found to undergo slow decomposition. It must be noted that under the strict exclusion of oxygen (air), the reaction does not take place. In the presence of oxygen, a small amount of the solvent mesitylene is oxidised to 3,5-dimethylbenzaldehyde which, in certain cases, complicates the work-up as residual 3,5-dimethylbenzaldehyde has to be removed *in vacuo* after column chromatographic separation of the compounds. This indicates that under the reaction conditions the Pt(0) species is partially oxidised, most probably to Pt(II). Instead

Scheme 9

of mesitylene, 4-*tert*-butylbenzene can be used as a solvent. The reaction does not proceed with  $PtCl_2$  as catalyst under otherwise identical conditions. As part of our on-going study<sup>41-43</sup> on E-ring annelated estranes as novel ligands for the estrogen receptor, a solution of the estrane based dieneyne **20** in mesitylene was heated in the presence of  $Pt(PPh_3)_4$ , but in this case unfortunately no reaction could be observed (Scheme 9).

2-Arylethynylcinnamate 24 was also heated in mesitylene in the presence of Pt(PPh<sub>3</sub>)<sub>4</sub> at 135 °C. The substrate 24 was prepared from 2-bromobenzaldehyde (22) by a sequential Sonogashira coupling–Wittig olefination (Scheme 10). Reversal of the transformation sequence, *i.e.* Wittig olefination followed by Sonogashira coupling, gave the product in much lower yield as the Sonogashira coupling proceeds only with difficulty (10% yield). Again, a solution of 2-arylethynylcinnamate 24 in mesitylene undergoes cyclisation, when reacted over Pt(PPh<sub>3</sub>)<sub>4</sub> and gives fulvene 26 as *E*- and *Z*-isomers. Single crystals of *Z*-26 could be obtained and an X-ray crystal structure of **Z**-26 has been carried out confirming the structure of 26.<sup>44</sup> Interestingly, in this reaction, fulvene 25 is formed as a side-product. The structure of 25 was also verified by X-ray crystal structure analysis.<sup>44</sup>

In conclusion, 1-ethynyl-2-vinyl-3,4-dihydronaphthalenes 15b, 15e and 15i as well as 1-ethynyl-2-vinylnaphthalenes 15f have been found to undergo diene-yne cyclisation reactions to dihydrophenanthrenes and phenanthrenes, respectively, catalysed by Ru(p-cymene) $Cl_2PPh_3$ . In an exploratory reaction, it was found that the reaction proceeds also with  $PtCl_2$  immobilised on a carbon nanofibre material [CN28-580°C, HCl treated]. Diene-ynes 15 and 24, which possess an internal alkyne moiety, could be cyclised to fulvenes 18, 25 and 26, catalysed by  $Pt(PPh_3)_4$ . Studies on the scope of the latter reaction concerning the range of possible substrates and catalysts as well as mechanistic studies are underway.

Melting points were measured on a Yanaco microscopic hot-stage and are uncorrected. IR spectra were measured with JASCO IR- 700 and Nippon Denshi JIR-AQ2OM machines. <sup>1</sup>H and <sup>13</sup>C NMR spectra were recorded with a JEOL EX-270 spectrometer. The chemical shifts are relative to TMS (solvent CDCl<sub>3</sub>, unless otherwise noted). Partially, assignments of <sup>13</sup>C signals were aided by DEPT (= Distortionless Enhancement by Polarisation Transfer) measurements. Mass spectra were measured with a JMS-01-SG-2 spectrometer (EI, 70 eV). Column chromatography was carried out on Wakogel 300.

Diisopropylamine (DIPA) was stored over KOH and distilled from KOH and DME was distilled from calcium hydride before use. Tet rakis(triphenylphosphine)platinum(0) [Pt(PPh<sub>3</sub>)<sub>4</sub>] and bis(triphenylphosphine)palladium(II) dichloride [(PPh3)2PdCl2] were obtained commercially. Ru(p-cymene)Cl<sub>2</sub>PPh<sub>3</sub> was prepared according to the literature.32 4-Cyanophenylacetylene was synthesised from 4-bromobenzonitrile and trimethylsilylacetylene with subsequent 4-bromobenzonitrile, trimethylsilylacetylene, desilvlation (i. N,N-diisopropylamine, Pd(PPh<sub>3</sub>)<sub>2</sub>Cl<sub>2</sub>, CuI, DME; ii. tetrabutylammonium fluoride, THF). Compounds  $14^{29a}$ ,  $15a-e^{28}$  and  $17a^{45}$  were prepared according to the literature. The conjugated phosphoranes ethoxycarbonylmethylidenetriphenylphosphorane, benzoylmethylidenetriphenylphosphorane, and acetylmethylidene-triphenylphosphorane were synthesised following the literature methods (i) ethyl bromoacetate, bromoacetophenone or bromoacetone, triphenylphosphine, chloroform; (ii) aq. Na<sub>2</sub>CO<sub>3</sub>, CH<sub>2</sub>Cl<sub>2</sub>).<sup>46-48</sup>

In general, the diene-yne cyclisation reactions of terminal alkyenes with Ru(p-cymene) $Cl_2PPh_3$  were carried out under an inert atmosphere (argon), while diene-yne cyclisations of internal alkynes were run under a normal atmosphere (air). Deaerated solvents were used for the Sonogashira coupling reactions.

*Ethyl 1-ethynylnapthalen-2-ylacrylate* (**15f**). *Method A:* A solution of **15b** (350 mg, 1.4 mmol) and DDQ (567 mg, 2.5 mmol) in benzene (20 ml) was heated at 80 °C for 90 min. The mixture was then concentrated *in vacuo*. The residue was subjected to column chromatography on silica gel (hexane/ether 6:1) to give **15f** (225 mg, 65%) as a colourless solid; m.p. 108 °C. Water (30ml) was added to the cooled solution and the mixture was extracted with chloroform (3 × 20 ml). The combined organic phase was dried over anhydrous MgSO<sub>4</sub>, concentrated *in vacuo*, and the residue was separated over column chromatography on silica gel (hexane/ether/CHCl<sub>3</sub> 3:1:1) to give 23 (510 mg, 50%) as a solid; m.p. 110 °C; (Found: M<sup>+</sup>, 231.0687. C<sub>16</sub>H<sub>9</sub>NO requires M, 231.0684);  $\delta_{\rm H}$  (270 MHz, CDCl<sub>3</sub>) 7.50–7.71 (3H, m), 7.65 ((2H, d,  ${}^{3}J = 9.2$  Hz), 7.69 (2H, d,  ${}^{3}J = 9.2$  Hz), 7.96 (1H, m), 10.59 (1H, s, CHO); MS (EI, 70 eV) *m/z* (%) 231 (M<sup>+</sup>) (4.7).

*Ethoxy 3-(4'-cyano-diphenylacetylen-2-yl)acrylate* (24): A mixture of **23** (176 mg, 0.76 mmol) and ethoxycarbonylmethylidenetriphenylphosphorane (424 mg, 1.22 mmol) in CHCl<sub>3</sub> (1.5 ml) was placed into a beaker closed with Saran Wrap<sup>®</sup> and was heated in an oven at 100 °C for 30 min. Direct column chromatography of the mixture on silica gel (hexane/ether/CHCl<sub>3</sub> 5:1:1) gave **24** (89%) as a solid; m.p. 118 °C; (Found: M<sup>+</sup>, 301.1106.  $C_{20}H_{15}NO_2$  requires M, 301.1103;  $\delta_H$  (270 MHz, CDCl<sub>3</sub>) 1.36 (3H, t,  $^{3}J = 7.0$  Hz, CH<sub>3</sub>), 4.29 (2H, q,  $^{3}J = 7.0$  Hz, CCH<sub>2</sub>), 6.56 (1H, d,  $^{3}J = 15.9$  Hz), 7.36–7.70 (8H, m), 8.25 (1H, d,  $^{3}J = 15.9$  Hz);  $\delta_C$  (67.8 MHz, CDCl<sub>3</sub>) 14.3, 91.2, 93.5, 111.8, 118.4, 120.2, 122.9, 126.3, 127.7, 129.4, 129.8, 132.0 (2C), 132.1 (2C), 133.0, 136.1, 142.0, 166.7; MS (EI, 70 eV) *m/z* (%) 301 (M<sup>+</sup>) (59), 273 (41), 227 (87), 130 (100).

Cyclisation of 24 in presence of Pt(PPh3)4: A mixture of 24 (133 mg, 0.44 mmol) and Pt(PPh<sub>3</sub>)<sub>4</sub> (31 mg, 2.5 10<sup>-5</sup> mol) in mesitylene (3 ml) was heated at 135 °C for 16 h. The resulting mixture was subjected directly to column chromatography (hexane/ether/CHCl<sub>3</sub> 7:1:1) to give 1-(Z)-Ethoxycarbonylmethylene-2-(4-cyanophenyl)-1*H*-indene (25) (7 mg, 5%) as an orange-red slowly crystallising solid; (Found:  $M^+$ , 301.1104.  $C_{20}H_{15}NO_2$  requires M, 301.1103);  $v_{max}$  (KBr/cm<sup>-1</sup>) 3018, 2965, 2208, 1715,  $\delta_{H}$  (270 MHz, CDCl<sub>3</sub>) 1.34 (3H, t,  ${}^{3}J$  = 7.0 Hz), 4.31 (2H, q,  ${}^{3}J$  = 7.0 Hz, OCH<sub>2</sub>), 6.25 (1H, s), 6.97 (1H, s), 7.26–7.36 (3H, m), 7.49 (2H, d,  ${}^{3}J$  = 8.6 Hz), 7.73 (2H, d,  ${}^{3}J = 8.6$  Hz), 8.60 (1H, d,  ${}^{3}J = 7.8$  Hz); MS (EI, 70 eV) m/z (%) 301 (M<sup>+</sup>) (10), 227 (15), 153 (39); 1-(Z)-(4-cyanophenyl)methylene-2-ethoxycarbonyl-1H-indene (26a) (31 mg, 23%) as a yellow-orange solid; m.p. 152°C; (Found: M<sup>+</sup>, 301.1105. C<sub>20</sub>H<sub>15</sub>NO<sub>2</sub> requires M, 301.1103); ν<sub>max</sub> (KBr/cm<sup>-1</sup>) 2960, 2210, 1720; δ<sub>H</sub> (270 MHz, CDCl<sub>3</sub>) 1.41 (3H, t,  ${}^{3}J$  = 7.0 Hz, CH<sub>3</sub>), 4.35 (2H, q,  ${}^{3}J$  = 7.0 Hz, OCH<sub>2</sub>), 7.06– 7.30 (3H, m), 7.42 (1H, d,  ${}^{3}J$  = 7.6 Hz), 7.64 (2H, d,  ${}^{3}J$  = 8.4 Hz), 7.74 (2H, d,  ${}^{3}J$  = 8.4 Hz), 7.75 (1H, s), 8.42 (1H, s);  $\delta_{\rm C}$  (67.8 MHz, CDCl<sub>3</sub>) 14.4, 60.4, 111.8, 118.7, 123.6, 128.0, 128.8, 129.8 (2C), 130.0, 132.3 (2C), 134.8, 134.9, 135.8, 140.6, 141.5, 141.7, 141.9, 164.5; MS (EI, 70 eV) m/z (%) 301 (M<sup>+</sup>) (100), 256 (61), 246 (38), 228 (77), 202 (41); (Found: C, 79.82; H, 5.00; N, 4.77%. The authors thank Prof. Dr. I. Mochida and Prof. Dr. S.-H. Yoon of Kyushu University for generous gifts of CNF [CN28-580°C, HCl treated]. The authors thank Mr K. Umeno for the preparation of 4-cyanophenylacetylene and Ms Y. Tanaka for the mass spectroscopic measurements. Elemental analysis was carried out at the Centre of Analysis, Kyushu University, Hakozaki Campus. The work was partially carried out within the framework of a CREST program. Financial support from the Japan Science and Technology Corporation (JST) is gratefully acknowledged.
