

Preparation of Carbodiimides from PhosphoramidatesZsuzsa M. Jászay,^a Imre Petneházy,^a László Tőke,^{*a} Béla Szajáni^b^a Technical University Budapest, H-1521 Budapest, Hungary^b Reanal Factory of Laboratory Chemicals, H-1441 Budapest, P.O. Box 54, Hungary

ω -Dialkylaminoalkylphosphoramidates are converted to ω -dialkyl-aminoalkyl(alkyl)carbodiimides in good yield in a two-phase system by reaction with isocyanates.

Water-soluble carbodiimides are valuable reagents in peptide chemistry and biochemistry,¹ usually as quaternary ammonium salts. They do not decompose in water and can therefore be used in aqueous solution for peptide coupling or to link enzymes to a solid support.

Though several methods are available for the synthesis of unsymmetrically substituted carbodiimides,^{2,3} none of them is quite suitable for the preparation of water-soluble carbodiimides. Recently, we reported a method for the synthesis of such carbodiimides starting from disubstituted ureas.⁴ We describe here another simple method for the preparation of ω -dialkylaminoalkyl(alkyl)carbodiimides **5** from phosphoramidates **1** and isocyanates **2**.

This method is already known,⁵ but it requires sodium hydride for the generation of the anion of phosphoramidate **1**, and the product so obtained is never sufficiently pure. Our method does not require either the presence of strong bases or strictly anhydrous conditions, and the product is usually obtained in analytically pure form without any distillation or crystallization steps. The reaction is carried out by stirring phosphoramidate **1** with isocyanate **2** in boiling xylene in the presence of solid potassium carbonate as a base.

Although the reaction is heterogenous, it does not require a phase-transfer catalyst. We assume that the role of the latter is taken over by the phosphoramidate anion. In contrast to the sodium hydride method, phosphoramidate anion is not present in large amounts in the reaction mixture, because its generation and reaction with the isocyanate molecule may take place simultaneously on the surface of potassium carbonate resulting in the phosphorylated urea intermediate 3. This is followed by rearrangement (N → O 1,3-phosphoryl migration) to 4 and elimination of the phosphate anion.⁵

The reaction can be monitored by GLC. The carbodiimides are isolated by filtering the solid potassium carbonate and potassium diethyl phosphate. The filtrate, after evaporation, gives the pure carbodiimide as a pale oil, which can be distilled under reduced pressure. The results are summarized in Table 1.

4	R ¹	R ²	R ³	n
a	<i>c</i> -C ₆ H ₁₁	CH ₃	CH ₃	2
b	<i>c</i> -C ₆ H ₁₁	CH ₃	CH ₃	3
c	<i>n</i> -C ₄ H ₉	CH ₃	CH ₃	3
d	<i>c</i> -C ₆ H ₁₁	C ₂ H ₅	C ₂ H ₅	3
e	C ₆ H ₅	CH ₃	CH ₃	3
f	<i>c</i> -C ₆ H ₁₁	-CH ₂ CH ₂ OCH ₂ CH ₂ -		2
g	<i>c</i> -C ₆ H ₁₁	-CH ₂ CH ₂ N(CH ₃)CH ₂ CH ₂ -		3
h	<i>c</i> -C ₆ H ₁₁	-(CH ₂) ₅ -		3
i	<i>c</i> -C ₆ H ₁₁	-(CH ₂) ₄ -		3

The carbodiimides can best be isolated by quaternization giving colorless, water-soluble crystalline products. For this purpose any alkylating agent such as methyl iodide, benzyl bromide or methyl *p*-toluenesulfonate may be used⁴ (Table 2).

Table 1. Carbodiimides 5 Prepared

Product	Reaction Time (h)	Yield (%)	bp (°C)/Torr	Molecular Formula ^a or Lit. bp (°C)/Torr	IR (neat) ν _{NCN} (cm ⁻¹)
5a	8	90	85-86/0.25	84-86/0.5 ⁸	2190

^a Microanalyses obtained: C ± 0.72, H ± 1.41, N ± 1.05; except 6aB (H - 2.12), 6cB (H - 2.48), 6hA (C - 1.18, H - 1.81, N + 4.37) and 6iA (H + 4.41, N + 4.69).

^b Oily crystals.

The *N*-substituted diethyl phosphoramidates **1** are prepared from diethyl phosphite and the appropriate diamine in an 1:1 mixture of benzene and 2N sodium hydroxide in the presence of carbon tetrachloride and a quaternary ammonium salt.^{6,7}

***ω*-Dialkylaminoalkyl(alkyl)carbodiimides 5; General Procedure:**

The appropriate *N*-substituted diethyl phosphoramidate **1** (0.01 mol) is dissolved in xylene (40 mL) and K₂CO₃ (5.5 g, 0.04 mol) and isocyanate **2** (0.011 mol) are added. The mixture is stirred under reflux for 8–13 h. After the disappearance of phosphoramidate (GLC), the mixture is cooled and filtered. The filtrate is evaporated and the remaining oil is generally the pure carbodiimide **5**. It can be distilled in high vacuum.

In the case of **5g** and **5h** the xylene solution stirred over silica (**2g**) before evaporation.

Quaternary Salts 6 of Carbodiimides 5; General Procedure:

To the solution of the appropriate carbodiimide (0.01 mol) in dry ether (20 mL), the alkylating agent [methyl iodide (1.4 g, 0.01 mol), or methyl *p*-toluenesulfonate (1.9 g, 0.01 mol), or benzyl bromide (1.6 g, 0.01 mol)] is added. The mixture is allowed to stand overnight at r.t. The precipitate is filtered off and washed with dry ether to give the carbodiimide quaternary salt (Table 2).
