(Received March 27, 1981)

The reaction products obtained by heating a mixture of  $\text{MoO}_3$  and carbon in a  $\text{SO}_2$  stream at various temperatures were examined. The possible reactions during the above process were also studied. Further, thermodynamical consideration was made of the formation of  $\text{MoS}_2$ . When a mixture of  $\text{MoO}_3$  and carbon was heated in a  $\text{SO}_2$  stream,  $\text{MoO}_2$  was formed above 400 °C. At 500—550 °C, the formation of a small amount of  $\text{Mo}_4\text{O}_{11}$  was also observed. Above 700 °C, the formation of  $\text{MoS}_2$  in addition to  $\text{MoO}_2$  was observed, and  $\text{MoS}_2$  alone was obtained at 1000 °C. Sulfur was obtained outside the heating zone throughout the temperature range in this experiment. The process of the formation of  $\text{MoS}_2$  by the reaction between  $\text{MoO}_3$  and  $\text{SO}_2$  in the presence of carbon can be represented as follows: The reaction between carbon and  $\text{SO}_2$  occurs at first to form sulfur. Above ca. 400 °C, the reductions of  $\text{MoO}_3$  with carbon and with sulfur occur to form  $\text{MoO}_2$ . Above ca. 700 °C,  $\text{MoS}_2$  is formed by the reaction between  $\text{MoO}_2$  and sulfur, which are formed by the above reactions.

As sulfidizing agents for synthesizing molybdenum disulfide ( $\text{MoS}_2$ ), hydrogen sulfide and sulfur have been well known. But there has been no report on the chemical process for synthesizing  $\text{MoS}_2$  from molybdenum trioxide ( $\text{MoO}_3$ ) using sulfur dioxide ( $\text{SO}_2$ ) as a sulfidizing agent. It is not only interesting from the viewpoint of the synthesis of the sulfide itself, but also important for the development of  $\text{SO}_2$  utilization, to obtain knowledge of the above chemical process.

In this work, the reaction products between  $\text{MoO}_3$  and  $\text{SO}_2$  in the presence of carbon at various temperatures were examined. In order to elucidate the reaction process between  $\text{MoO}_3$  and  $\text{SO}_2$  in the presence of carbon, the reactions of  $\text{MoO}_3$  with carbon and of  $\text{MoO}_3$  with gaseous sulfur in a  $\text{SO}_2$  stream were examined. Also, the reactions of  $\text{MoO}_2$ , formed during the reaction process between  $\text{MoO}_3$  and  $\text{SO}_2$  in the presence of carbon, with carbon and of  $\text{MoO}_2$  with gaseous sulfur in a  $\text{SO}_2$  stream were examined. Further, thermodynamical consideration was made of the formation of  $\text{MoS}_2$ .

### Experimental

The  $\text{MoO}_3$  used was prepared by the thermal decomposition of the guaranteed reagent ammonium paramolybdate at 600 °C. The carbon was prepared by the thermal decomposition of the guaranteed reagent D-glucose. The above materials were used as powders under 150 mesh. Gaseous  $\text{SO}_2$  was dried by passing it through concd  $\text{H}_2\text{SO}_4$  and over  $\text{P}_2\text{O}_5$ .

A mixture of  $\text{MoO}_3$  and carbon at a specified ratio in a quartz boat (length: 72 mm, width: 16 mm, depth: 9 mm) was placed in a transparent quartz reaction tube (inner diameter: 28 mm, length: 1000 mm). Gaseous  $\text{SO}_2$  was then introduced into the reaction tube. The sample part was positioned in the middle of the tubular electric furnace (heating length: 300 mm) maintained at a specified temperature for 1 h. The temperature of the sample part was controlled within  $\pm 2$  °C. After heating, the sample was held at 100 °C for 1 h in an argon stream in order to release the adsorbed  $\text{SO}_2$  on unreacted carbon.<sup>1)</sup> The reactions of  $\text{MoO}_3$  with carbon in an argon stream, of  $\text{MoO}_3$  with gaseous sulfur in a  $\text{SO}_2$  stream, of  $\text{MoO}_2$  with carbon in an argon stream, and

of  $\text{MoO}_2$  with gaseous sulfur in a  $\text{SO}_2$  stream were examined in a similar manner.

The X-ray analysis of the sample was performed with an X-ray powder diffractometer equipped with a proportional counter using Ni filtered Cu radiation. The thermogravimetry (TG) was performed by using a thermal balance with a quartz helix. The sensitivity of the quartz helix used was approximately 72 mm/g, and the heating rate of 2.5 °C/min was employed.

The molybdenum content in the sample was determined gravimetrically as  $\text{PbMoO}_4$  after the fusion of the sample with a mixture of  $\text{Na}_2\text{CO}_3$  and  $\text{K}_2\text{CO}_3$ . The sulfur content in the sample was determined gravimetrically as  $\text{BaSO}_4$  after decomposing the sample with  $\text{HNO}_3$  and  $\text{KClO}_3$ .

### Results and Discussion

*Reaction Products between Molybdenum Trioxide and Sulfur Dioxide in the Presence of Carbon.*

The TG of  $\text{MoO}_3$  (0.3 g) in a  $\text{SO}_2$  stream at a flow-rate of 50  $\text{cm}^3/\text{min}$  was carried out. The heating temperature of the sample was limited to below 700 °C, since  $\text{MoO}_3$  vaporized above this temperature. No weight change was observed, and the sample after the heating was found to be unreacted  $\text{MoO}_3$  by X-ray analysis.<sup>2)</sup> These results indicate that  $\text{MoO}_3$  does not react with  $\text{SO}_2$ .

The reaction between  $\text{MoO}_3$  and  $\text{SO}_2$  in the presence of carbon was then examined. First, the products obtained by heating a mixture of 2.00 g of  $\text{MoO}_3$  and 1.20 g of carbon at various temperatures for 1 h in a  $\text{SO}_2$  stream at a flow-rate of 100  $\text{cm}^3/\text{min}$  were examined. The results are shown in Table 1, together with the weight changes in the samples. The sample in the boat was identified by X-ray analysis.<sup>2-5)</sup>

The formation of  $\text{MoO}_2$  was observed above 400 °C, and a small amount of  $\text{Mo}_4\text{O}_{11}$  in addition to  $\text{MoO}_2$  was also observed at 500—550 °C. The formation of  $\text{MoS}_2$  was observed at 700 °C. A small amount of sulfur was obtained outside the heating zone throughout the temperature range in this experiment. The slight increase in the sample weight at 350—400 °C was due to the adsorption of the sulfur formed by the reaction on the unreacted carbon.<sup>1)</sup>

In addition to the above observations, it was observed

TABLE 1. PRODUCTS OBTAINED BY HEATING A MIXTURE OF  $\text{MoO}_3$  AND CARBON IN A  $\text{SO}_2$  STREAM AT VARIOUS TEMPERATURES

Temp °C	Weight change/%	Sample in the boat	Amount of sulfur obtained outside the heating zone/g
350	+0.1	$\text{MoO}_3$	Trace
400	+0.1	$\text{MoO}_3 \gg \text{MoO}_2$	Trace
450	-0.1	$\text{MoO}_3 \gg \text{MoO}_2$	Trace
500	-4.7	$\text{MoO}_2 > \text{MoO}_3 > \text{Mo}_4\text{O}_{11}$	Trace
550	-7.2	$\text{MoO}_2 \gg \text{MoO}_3 > \text{Mo}_4\text{O}_{11}$	Trace
600	-8.8	$\text{MoO}_2$	0.00 <sub>5</sub>
650	-8.9	$\text{MoO}_2$	0.03
700	-7.8	$\text{MoO}_2 \gg \text{MoS}_2$	0.09

that a small amount of unreacted  $\text{MoO}_3$  vaporized and deposited outside the heating zone at 700 °C. As seen from Table 1, all the  $\text{MoO}_3$  used was converted to non-volatile  $\text{MoO}_2$  above 600 °C. The reactions at temperatures above 800 °C were examined by using a mixture of  $\text{MoO}_2$  and carbon. When a mixture of 2.00 g of  $\text{MoO}_2$  and 1.20 g of carbon was heated in a  $\text{SO}_2$  stream (100  $\text{cm}^3/\text{min}$ ) at 800 °C for 1 h, unreacted carbon was not observed in the sample obtained after the heating. This result is considered to be due to the fact that the reaction between carbon and  $\text{SO}_2$  proceeds markedly.<sup>1)</sup> Based on the results of preliminary experiments on the suitable amount of carbon to be mixed, the products obtained by heating a mixture of 2.00 g of  $\text{MoO}_2$  and 5.00 g of carbon in a  $\text{SO}_2$  stream (100  $\text{cm}^3/\text{min}$ ) at various temperatures above 800 °C for 1 h were examined. The mixture of  $\text{MoO}_2$  and carbon was prepared by adding fresh carbon to a mixture of  $\text{MoO}_2$  and carbon, obtained by the reduction of  $\text{MoO}_3$  with carbon at 700 °C. The results are shown in Table 2.

TABLE 2. PRODUCTS OBTAINED BY HEATING A MIXTURE OF  $\text{MoO}_2$  AND CARBON IN A  $\text{SO}_2$  STREAM AT VARIOUS TEMPERATURES

Temp °C	Weight loss/%	Sample in the boat	Amount of sulfur obtained outside the heating zone/g
800	34.3	$\text{MoO}_2 \approx \text{MoS}_2$	3.90
900	54.0	$\text{MoS}_2 > \text{MoO}_2$	4.86
950	57.6	$\text{MoS}_2 > \text{MoO}_2$	5.04
1000	64.2	$\text{MoS}_2$	5.66

Chemical analysis of the sample obtained at 1000 °C showed it to contain 59.8% Mo and 39.9% S. Chemical analysis also proved that sulfur was not adsorbed on the unreacted carbon at 1000 °C. From these results, the sulfur was found to be due to the sulfide formed. The atomic ratio of Mo : S in the sample was calculated to be 1 : 2.0<sub>0</sub>. The results indicated that all the  $\text{MoO}_2$  used was sulfidized to  $\text{MoS}_2$  at 1000 °C.

#### Reaction Process between Molybdenum Trioxide and Sulfur

#### Dioxide in the Presence of Carbon.

To elucidate the reaction process between  $\text{MoO}_3$  and  $\text{SO}_2$  in the presence of carbon, the following experiments were carried out under conditions similar to those described above.

**Reaction between  $\text{MoO}_3$  and Carbon:** The products formed by heating a mixture of  $\text{MoO}_3$  (2.00 g) and carbon (1.20 g) at various temperatures in an argon stream (100  $\text{cm}^3/\text{min}$ ) for 1 h were examined. The results are shown in Table 3.

TABLE 3. EXPERIMENTAL RESULTS FOR THE REACTION BETWEEN  $\text{MoO}_3$  AND CARBON IN AN ARGON STREAM

Temp °C	Weight loss/%	Sample in the boat
350	—	$\text{MoO}_3$
400	0.2	$\text{MoO}_3 \gg \text{MoO}_2$
450	0.9	$\text{MoO}_3 \gg \text{MoO}_2$
500	5.2	$\text{MoO}_2 > \text{MoO}_3$
600	9.7	$\text{MoO}_2 \gg \text{MoO}_3$
700	9.7	$\text{MoO}_2$

These results indicate that the reduction of  $\text{MoO}_3$  with carbon to form  $\text{MoO}_2$  proceeds above about 400 °C.

**Reaction between  $\text{MoO}_3$  and Sulfur in a  $\text{SO}_2$  Stream:** As seen from Table 1, when the mixture of  $\text{MoO}_3$  and carbon was heated in a  $\text{SO}_2$  stream, sulfur was formed. The reaction between carbon and  $\text{SO}_2$  occurs even at 350 °C to form sulfur and this reaction proceeds markedly above about 700 °C, as reported by the present authors.<sup>1)</sup> Therefore, the reaction between  $\text{MoO}_3$  and gaseous sulfur was examined in a  $\text{SO}_2$  stream.

$\text{MoO}_3$  (2.00 g) was heated in a stream of  $\text{SO}_2$  (100  $\text{cm}^3/\text{min}$ ) containing a specified amount of gaseous sulfur at various temperatures for 1 h. The amounts of sulfur introduced at various temperatures were controlled so as to be the same as those obtained by heating 1.20 g of carbon in a stream of  $\text{SO}_2$  at a flow-rate of 100  $\text{cm}^3/\text{min}$  for 1 h: the amounts were 0.01 g for the experiments below 550 °C, 0.03 g at 600 °C, 0.09 g at 650 °C, and 0.25 g at 700 °C.<sup>1)</sup> The results are shown in Table 4.

These results and the fact that  $\text{MoO}_3$  does not react with  $\text{SO}_2$  as described before show that the reaction between  $\text{MoO}_3$  and gaseous sulfur proceeds above about 400 °C and that  $\text{MoO}_3$  was reduced to  $\text{MoO}_2$ .

TABLE 4. PRODUCTS OBTAINED BY HEATING  $\text{MoO}_3$  IN A STREAM OF  $\text{SO}_2$  CONTAINING GASEOUS SULFUR

Temp °C	Weight loss/%	Sample in the boat
350	—	$\text{MoO}_3$
400	0.2	$\text{MoO}_3 \gg \text{MoO}_2$
450	0.3	$\text{MoO}_3 \gg \text{MoO}_2$
500	0.5	$\text{MoO}_3 \gg \text{MoO}_2 > \text{Mo}_9\text{O}_{26}, \text{Mo}_4\text{O}_{11}$
550	0.7	$\text{MoO}_3 \gg \text{MoO}_2 > \text{Mo}_9\text{O}_{26}, \text{Mo}_4\text{O}_{11}$
600	1.0	$\text{MoO}_3 > \text{MoO}_2 > \text{Mo}_9\text{O}_{26} > \text{Mo}_4\text{O}_{11}$
650	4.2	$\text{MoO}_3 > \text{MoO}_2 > \text{Mo}_9\text{O}_{26} \gg \text{Mo}_4\text{O}_{11}$
700	8.2	$\text{MoO}_2 \gg \text{MoO}_3 > \text{Mo}_9\text{O}_{26}, \text{Mo}_4\text{O}_{11}$

These experimental results showed that the MoO<sub>2</sub> formed by heating a mixture of MoO<sub>3</sub> and carbon in a SO<sub>2</sub> stream (Table 1) was formed by the reductions of MoO<sub>3</sub> with carbon and with sulfur. As seen from Table 1, the formation of a small amount of Mo<sub>4</sub>O<sub>11</sub> in addition to MoO<sub>2</sub> was observed at 500–550 °C. As seen from Table 3, no formation of any intermediate oxide was observed in the reaction between MoO<sub>3</sub> and carbon. As seen from Table 4, however, the formation of intermediate oxides (Mo<sub>4</sub>O<sub>11</sub>,<sup>4)</sup> Mo<sub>9</sub>O<sub>26</sub>,<sup>6)</sup> in addition to MoO<sub>2</sub> was observed during the reaction between MoO<sub>3</sub> and sulfur. It has been reported that on heating a mixture of MoO<sub>3</sub> and a sufficient amount of carbon in an argon stream, no intermediate oxide is formed.<sup>7)</sup> These facts suggested that the Mo<sub>4</sub>O<sub>11</sub> formed by heating a mixture of MoO<sub>3</sub> and carbon in a SO<sub>2</sub> stream was due to the reduction of MoO<sub>3</sub> with sulfur.

**Formation Reaction of MoS<sub>2</sub> from MoO<sub>2</sub>:** As mentioned before, when a mixture of MoO<sub>3</sub> and carbon was heated in a SO<sub>2</sub> stream, MoS<sub>2</sub> was formed above about 700 °C. Above this temperature, MoO<sub>3</sub> was reduced to MoO<sub>2</sub>. Therefore, the reactions of MoO<sub>2</sub> with carbon in an argon stream and of MoO<sub>2</sub> with gaseous sulfur in a SO<sub>2</sub> stream were examined.

The products formed by heating a mixture of MoO<sub>2</sub> (2.00 g) and carbon (5.00 g) at various temperatures for 1 h in an argon stream (100 cm<sup>3</sup>/min) were examined. The results are shown in Table 5.

TABLE 5. EXPERIMENTAL RESULTS FOR THE REACTION BETWEEN MoO<sub>2</sub> AND CARBON IN AN ARGON STREAM

Temp °C	Weight loss/%	Sample in the boat
700	—	MoO <sub>2</sub>
750	0.7	MoO <sub>2</sub> >> Mo <sub>2</sub> C > Mo
800	2.0	MoO <sub>2</sub> > Mo <sub>2</sub> C > Mo
900	7.6	Mo <sub>2</sub> C > MoO <sub>2</sub> > Mo
1000	11.3	Mo <sub>2</sub> C > Mo

The results indicate that the reaction between MoO<sub>2</sub> and carbon proceeds above about 750 °C to form molybdenum<sup>8)</sup> and dimolybdenum carbide (Mo<sub>2</sub>C).<sup>9)</sup> The Mo<sub>2</sub>C was considered to be due to the reaction between the molybdenum formed and the carbon.<sup>7)</sup>

The products formed by heating MoO<sub>2</sub> (2.00 g) in a stream of SO<sub>2</sub> (100 cm<sup>3</sup>/min) containing a specified amount of gaseous sulfur at various temperatures for 1 h were examined. The MoO<sub>2</sub> used was prepared by the hydrogen reduction of MoO<sub>3</sub> at 600 °C,<sup>10)</sup> because the reduction of MoO<sub>3</sub> with carbon gave a mixture of MoO<sub>2</sub> and unreacted carbon, as described in the previous paragraph.

Prior to this experiment, the amounts of sulfur formed by heating 5.00 g of carbon at various temperatures for 1 h in a SO<sub>2</sub> stream at a flow-rate of 100 cm<sup>3</sup>/min were examined.<sup>1)</sup> Based on the experimental results, the amounts of sulfur introduced at various temperatures were controlled to be 0.43 g for the experiment at 650 °C, 0.81 g at 700 °C, 4.79 g at 800 °C, 5.46 g at 900 °C, and 6.59 g at 1000 °C. The experimental results are shown in Table 6. These results indicate that the

TABLE 6. PRODUCTS OBTAINED BY HEATING MoO<sub>2</sub> IN A STREAM OF SO<sub>2</sub> CONTAINING GASEOUS SULFUR

Temp °C	Weight gain/%	Sample in the boat
650	—	MoO <sub>2</sub>
700	4.2	MoO <sub>2</sub> > MoS <sub>2</sub>
800	10.8	MoO <sub>2</sub> ≈ MoS <sub>2</sub>
900	17.6	MoS <sub>2</sub> > MoO <sub>2</sub>
1000	22.9	MoS <sub>2</sub> >> MoO <sub>2</sub>

reaction between MoO<sub>2</sub> and gaseous sulfur proceeds above about 700 °C to form MoS<sub>2</sub>.

As shown in Table 5, on heating a mixture of MoO<sub>2</sub> and carbon in an argon stream, MoO<sub>2</sub> was reduced to molybdenum, and Mo<sub>2</sub>C was also formed. Thermodynamical consideration was made on the Mo–S–C–O system, in order to discuss whether MoO<sub>2</sub> was converted to MoS<sub>2</sub> *via* molybdenum or without molybdenum formation. The chemical potential diagrams for the Mo–S–C–O system were constructed in a manner similar to that described by Yazawa<sup>11)</sup> on the basis of the available thermodynamic data<sup>12)</sup> and phase relations.<sup>13)</sup> As an example, the digram at 1000 °C is shown in Fig. 1. The broken line shows the oxygen and sulfur potentials in the gas phase formed by the reaction between carbon and SO<sub>2</sub>, depending on the carbon content in the gas phase. The activity of carbon is unity at the dot mark. In these calculations, CO, CO<sub>2</sub>, O<sub>2</sub>, COS, CS<sub>2</sub>, SO<sub>2</sub>, SO<sub>3</sub>, S<sub>2</sub>, S<sub>4</sub>, S<sub>6</sub>, and S<sub>8</sub> were assumed to be gaseous products between carbon and SO<sub>2</sub>.

Fig. 1. Chemical potential diagram for the Mo–S–C–O system at 1000 °C.

The results shown in Fig. 1 indicate that MoO<sub>2</sub> is converted to MoS<sub>2</sub> *via* molybdenum under a low pressure of SO<sub>2</sub> below *ca.* 10<sup>–7</sup> atm, and that MoO<sub>2</sub> is converted to MoS<sub>2</sub> without molybdenum formation under a higher partial pressure of SO<sub>2</sub>. Considering the experimental conditions in this work, the results in Fig. 1 show that MoS<sub>2</sub> is formed from MoO<sub>2</sub> without any formation of molybdenum.

The process of formation of MoS<sub>2</sub> by the reaction between MoO<sub>3</sub> and SO<sub>2</sub> in the presence of carbon can be represented as follows: On heating a mixture of MoO<sub>3</sub> and carbon in a SO<sub>2</sub> stream, the reaction between

carbon and  $\text{SO}_2$  occurs at first to form sulfur. Above about 400 °C, the reductions of  $\text{MoO}_3$  with carbon and with sulfur occur to form  $\text{MoO}_2$ . Above about 700 °C,  $\text{MoS}_2$  is formed by the reaction between  $\text{MoO}_2$  and sulfur, which are formed by the above reactions.

The present work was partially supported by a Grant-in-Aid for Scientific Research No. 555306 from the Ministry of Education, Science and Culture.
