**Abstract:** The use of  $\text{Cp}_2\text{YCl}$  and  $\text{YCl}_3$  as effective catalysts for the regioselective acylative cleavage of epoxides, especially for the conversion of  $\alpha,\beta$ -epoxyketones to  $\alpha$ -chloroenones is described.

The application of rare earth reagents in organic synthesis has been growing fast since the late seventies<sup>1</sup>. In the course of our study on the cleavage reaction of the  $\text{Cp-Y}$   $\pi$  bond of  $\text{Cp}_2\text{YCl}$  with electrophilic reagents, we found that fulvenes were obtained in high yield when aldehydes or ketones were used as the

electrophilic reagents<sup>2</sup>. However, in the case of acyl chlorides, which are more reactive electrophilic reagents than aldehydes and ketones, 4-chlorobutyl esters as well as diacylcyclopentadienes were isolated, suggesting that  $\text{Cp}_2\text{YCl}$  might be a good catalyst for the acylative ring-opening of tetrahydrofuran<sup>3</sup>. Further studies have shown that  $\text{Cp}_2\text{YCl}$  and  $\text{LnCl}_3$  did function as efficient catalysts for this cleavage reaction in dichloromethane<sup>4</sup>. Naturally, we would explore the application of these Lewis acidic rare earth compounds as catalyst to the acylative cleavage of other types of cyclic ethers. Ln-catalyzed epoxide ring cleavage has been reported, however, the only examples are those with nucleophiles such as  $\text{RSH}$ <sup>5</sup> and  $\text{Me}_3\text{SiCN}$ <sup>6</sup>, catalyzed by anhydrous lanthanide trichlorides. We here wish to report that  $\text{Cp}_2\text{YCl}$  and  $\text{YCl}_3$  catalyze the regioselective acylative cleavage of epoxides with electrophilic reagents, namely acyl chlorides, under mild conditions.

Epoxides reacted with acyl chlorides readily to give vicinal chloroesters in the presence of 1% (molar ratio)  $\text{Cp}_2\text{YCl}$  (eq. 1). The results are summarized in

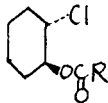

Table 1. Phenyl oxirane favours  $\alpha$ -cleavage, while alkyl oxiranes favour  $\beta$ -cleavage, with chloromethyl oxirane giving exclusive formation of 2. Cyclohexene

oxide was cleaved stereoselectively leading only to trans-chloroester.

$\text{YCl}_3$  also catalyzed regioselective acylative cleavage of epoxides under mild conditions (eq. 1). Table 2 gives the results. However,  $\text{YCl}_3$  was less efficient as catalyst when compared to  $\text{Cp}_2\text{YCl}$ . 10%  $\text{YCl}_3$  was required to reach the activity of 1%  $\text{Cp}_2\text{YCl}$ . The two catalysts have similar regioselectivity, as shown in Table 1 and 2.

One of the methods for the synthesis of lactones is the intramolecular cyclisation of vicinal haloester (Scheme 1). Products obtained from the reaction of epoxides with cinnamoyl chloride (Table 2, Entry i, j, k) are starting materials for this cyclisation. Since vicinal iodoesters perform such a cyclisation more

easily, we explored the possibility of gaining access to vicinal iodoesters by the addition of NaI into the above reaction system. As expected, in some cases vicinal iodoesters were acquired in very high yield with excellent regioselectivity (eq. 2 and Table 3). Using acetyl chloride as electrophilic reagent, however, both vicinal iodoester and chloroester (about 1:3) were obtained. Addition of NaBr still afforded vicinal chloroester, no vicinal bromoester was detected by  $^1\text{H}$  NMR.

It was interesting to note that  $\alpha,\beta$ -epoxycyclohexanone (6) reacted with benzoyl chloride in the presence of 10 mol%  $\text{YCl}_3$  generating  $\alpha$ -chloro- $\alpha,\beta$ -cyclohexenone (7) instead of resulting in usual acylative cleavage (eq. 3). Using 9 as substrate, the same observation was obtained (eq. 4), but for 11 and 14, usual acylative cleavage products were afforded (eq. 5 and 6). Although the reason why this elimination occurs in some cases is now unclear, it worth noting that this reaction might provide a new convenient method for the synthesis of  $\alpha$ -chloroenones.

hydrous  $\text{YCl}_3$ <sup>7</sup> was used and  $\text{Cp}_2\text{YCl}$  was prepared according to the reported method<sup>8</sup>. Epoxides **6**, **9**, **11** and **14** were prepared by the modified method based on the literature<sup>9</sup>, and the other ones were purchased from Tokyo Kasei. M.p.s were uncorrected.  $^1\text{H}$  NMR spectra were recorded in  $\text{CCl}_4$  or  $\text{CDCl}_3$  on a Varian EM-360L (60 MHz) or AM-300 (300 MHz) spectrometer with  $\text{SiMe}_4$  as the internal standard. IR spectra were recorded on a Shimadzu IR-440 instrument. MS data were obtained on a Finnigan 4021 spectrometer.

General Procedure for Table 1. Into a solution of  $\text{Cp}_2\text{YCl}$  (17.8 mg, 0.07 mmol) in 1 ml  $\text{CH}_2\text{Cl}_2$ , styrene oxide (840 mg, 7 mmol) and acetyl chloride (550 mg, 7 mmol)
