# SYNTHESIS OF MC 903, A BIOLOGICALLY ACTIVE VITAMIN D METABOLITE ANALOGUE

MARTIN J. CALVERLEY

Leo Pharmaceutical Products, DK-2750 Ballerup, Denmark

(Received in UK 13 July 1987)

<u>Summary</u>: MC 903 (**4**), a 1,24-dihydroxyvitamin D analogue containing a double bond and a cyclopropane ring in the side chain, was synthesised in 12 steps from vitamin  $D_2$ .

 $l\alpha$ ,25-Dihydroxyvitamin D<sub>3</sub> (1,25-(OH)<sub>2</sub>-D<sub>3</sub>,**2**) is the hormonally active metabolite of vitamin D<sub>3</sub> (1) and mediates its effect on intestinal uptake of calcium and phosphate by binding to a receptor present in intestinal epithelium cells.<sup>1</sup> Recently, specific receptors for 1,25-(OH)<sub>2</sub>-D<sub>3</sub> have been discovered in various cells, such as skin<sup>2</sup> and certain tumour cells,<sup>3</sup> which are not regarded as participating in mineral metabolism. Furthermore it has been observed<sup>4,5</sup> that the hormone is a potent inhibitor of proliferation and inducer of differentiation of such cells. This has led to the speculation that  $1,25-(OH)_2-D_3$  may find application in the treatment of disease states characterised by excessive cell proliferation and incomplete cell differentiation, such as psoriasis and leukemia. However, the potent effect of the natural hormone on calcium metabolism involves the risk that such treatment may induce hypercalcemia, and this has stimulated the search for analogues having a relatively weak systemic effect on calcium metabolism while maintaining potent regulatory effects on cell proliferation and differentiation.

The discovery that transposition of the 25-hydroxyl group of  $1,25-(OH)_2-D_3$  to the  $24(\underline{R})$  position results in an unnatural analogue  $[1\alpha, 24(\underline{R})$ -dihydroxyvitamin  $D_3$ , 3] with essentially equal cell differentiating ability in vitro,<sup>5,6</sup> but with a slightly reduced tendency to give hypercalcemia in

<u>vivo</u>,<sup>7</sup> suggests that other  $|\alpha, 24$ -dihydroxylated analogues could also be of interest. We have explored the biological consequences of incorporating carbons 25, 26 and 27 of **3** and related compounds into various cycloalkane rings, a modification which has not been tried before in the vitamin D field, and in this report we describe the synthesis of the novel cyclopropyl,  $\Delta^{22}$  derivative (MC 903, **4**), in which a dramatic separation of these biological effects has been achieved, and which has been selected as a candidate for clinical evaluation in the treatment of psoriasis.

The availability of steroidal aldehydes by cleavage of the side chain double bond in  $\Delta^{22}$  steroids (ergosterol, stigmasterol) has made them attractive intermediates for the partial synthesis of analogues possessing a modified side chain,<sup>8</sup> and these analogues can be converted to vitamin D-type seco-steroids.<sup>9</sup> The more direct synthetic strategy we have adopted follows the lead of Hesse's group in taking the readily available vitamin D<sub>2</sub> (5) as starting material,<sup>10</sup> and we have already briefly reported on our use of this approach in the modification of the vitamin D<sub>2</sub> side chain <u>via</u> reductive alkylation of a versatile seleno-acetal intermediate.<sup>11</sup> We now report related work based on Wittig methodology, which similarly involves a convenient, late-stage, versatile intermediate for the synthesis of new l $\alpha$ -hydroxylated vitamin D analogues.

The reactions taking vitamin  $D_2$  (5) to the la-hydroxylated (5<u>E</u>)-vitamin  $D_2$  derivative 9 were carried out essentially as described by Hesse's group,  $\frac{12}{12}$  with certain practical modifications. Thus, vitamin D<sub>2</sub> was converted to its SO<sub>2</sub>-adducts using the very convenient procedure used by Takayama's group, <sup>13</sup> in which the vitamin is simply dissolved in liquid sulphur dioxide, and the excess solvent is removed after allowing to react for 30 min at its boiling point. The <u>ca</u>. 1:1 mixture of vitamin  $D_2 SO_2$ -adducts<sup>13a</sup> (6) obtained by this method as a foam was directly silylated, and each of the crystalline tert-butyldimethylsilyl (TBDMS) ethers (7a, b) was isolated and is characterized here for the first time. Cheletropic extrusion of SO<sub>2</sub> in refluxing ethanol containing suspended NaHCO, converted either isomer to the same  $(5\underline{E})$ -vitamin derivative 8, which was submitted as a crude oil directly to a selenite mediated allylic hydroxylation reaction under the conditions developed by Hesse's group. These conditions allow selective introduction of a la-hydroxyl group into the (5E)-vitamin D system in ca. 50-60% yields, the major identified by-product being the  $1\beta$ hydroxylated compound.<sup>12</sup> In our hands, the ratio of  $l\alpha$ -(9) to  $l\beta$ -(10) hydroxylated products was found to be ca. 6:1 by HPLC analysis of the reaction mixture (this ratio being constant during the reaction course), but we have found that the undesired isomer is readily separated after a derivatisation step. Thus, silylation of the crude hydroxylation products and purification involving a

<u>a</u> SO<sub>2</sub> (liquid, reflux); <u>b</u> t-BuMe<sub>2</sub>SiCl, Imidazole (DMF, 20 °C); <u>c</u> NaHCO<sub>3</sub> (EtOH, reflux); <u>d</u> SeO<sub>2</sub>, <u>N</u>-methylmorpholine <u>N</u>-oxide (MeOH - CH<sub>2</sub>Cl<sub>2</sub>, reflux).

4610

rapid filtration through silica gel and crystallisation gave the pure bis-TBDMS ether (11), leaving the corresponding oily  $1\beta$ -isomer (12) to be isolated from the mother liquor by careful chromatography. The overall yield of the intermediate (11) from vitamin D<sub>2</sub> was 35%.

Protection of the conjugated triene system as a dienophile adduct is required to allow selective ozonolysis of  $\Delta^{22}$  in vitamin  $D_2$ , <sup>10</sup> and this is also the case with the derivatised la-hydroxy-(5<u>E</u>)-vitamin (11). Thus, treatment of 11 (in diethyl ether as a co-solvent) with liquid sulphur dioxide gave quantitatively a crystalline mixture of SO<sub>2</sub>-adducts (13). In this case the ratio of adducts was found to be <u>ca</u>. 3:1. Takayama's group reported <sup>13b</sup> the positions of the C-18 <u>H</u><sub>3</sub> singlet in the <sup>1</sup>H-NMR spectra of vitamin D (6<u>R</u>) and (6<u>S</u>) SO<sub>2</sub>-adducts of known configuration, and these fall into mutually exclusive ranges [<u>viz</u>.(6<u>R</u>),  $\delta$  <u>ca</u>. 0.55; (6<u>S</u>),  $\delta$  0.65-0.70]. These ranges are not exceeded in the 1-substituted analogues of the present work, nor indeed in a variety of other analogues (unpublished data), and therefore the assignments of configuration at C-6 in the major isomer, **13a** (6<u>S</u>;  $\delta$  0.66), and the minor isomer, **13b** (6<u>R</u>;  $\delta$  0.57), are made on this basis. The mixture of adducts **13** was conveniently used directly in the subsequent steps, but for ease of characterisation the major (less polar) isomer **13a** was separated by chromatography. Ozonolysis of this compound gave the aldehyde **14a** (81%), from which thermal cheletropic extrusion of SO<sub>2</sub> in the presence of NaHCO<sub>3</sub> gave the key intermediate **15**, the same product obtained in the minor series from **13b** <u>via</u> **14b**.

<u>a</u> SO<sub>2</sub> (Et<sub>2</sub>O, -10 °C); <u>b</u> i. O<sub>3</sub>; ii. PPh<sub>3</sub> (CH<sub>2</sub>Cl<sub>2</sub>- MeOH, -70 to 0 °C); <u>c</u> NaHCO<sub>3</sub> (EtOH, reflux).

The slightly less polar C-20 epimer **16** was an unavoidable by-product of these reactions, and control of the reaction conditions was necessary to obtain high yields of **15**. It was established that progressive epimerisation at C-20 occurred under the mildly basic conditions necessary<sup>14</sup> to stabilise the acid-sensitive conjugated triene system of the product in the SO<sub>2</sub>-extrusion reaction.<sup>15</sup> The extent of epimerisation depended on the solvent: reactions in refluxing methanol rapidly gave a <u>ca</u>. 1:1 mixture of **15** and **16** (together with considerable degradation), while the proportion of 16 was reduced to <u>ca</u>. 6% (HPLC control) (and degradation was negligible) in refluxing ethanol. However, if the latter reactions were prolonged over the 60-90 min required for essentially complete consumption of starting materials **14**, serious epimerisation ensued (<u>ca</u>. 50% at 5 h). The use of <u>n</u>-butanol (at 80°C) instead of ethanol gave a similar initial proportion of epimer (5%) but an increased stability to extended reaction times. On the other hand, the use of <u>N,N</u>-dimethylformamide (at 80°C) as solvent gave a slightly higher initial proportion of epimer.

As implied above, the undesired (20R) aldehyde (16) could be removed by chromatography for the characterisation of the pure (20S) isomer (15). However, it was found expedient to defer separation of the by-product series until after the next step, since the crude product obtained conveniently and without material loss from the reaction run in ethanol as described above crystal-

lised directly in a form which contained <u>ca</u>. 90% of **15** and could be stored for considerable periods.<sup>16</sup> Treatment of this product with about a molar excess of cyclopropylcarbonylmethylene-triphenylphosphorane (**1**, readily obtained from cyclopropyl methyl ketone; see Experimental) in dimethyl sulphoxide at 105°C for 4 h led to the isolation of the pure enone (17) in overall 60-63% yields from **14a** or the mixture **14a/14b**. The (20<u>S</u>) epimer (**18**) was also isolated (4%) and characterised. The proportion of "natural" and "unnatural" C-20 epimers in the starting material for the Wittig reaction was found to be equal to that in the product and also to remain constant over the reaction period (HPLC control). Only products containing the (<u>E</u>)-configurated  $\Delta^{22}$  were obtained from these reactions (<sup>1</sup>H-NMR analysis: <u>J<sub>22,23</sub> ca</u>. 16 Hz).<sup>17</sup>

The next step in the synthesis required a selective 1,2-reduction of the conjugated carbonyl group of 17. To facilitate the identification of possible products of over-reduction in this reaction and (not least) to allow the synthesis of the side chain saturated target compound corresponding to 4, the enone 17 was converted to the saturated ketone 19, by reduction with  $Na_2S_2O_4$  under

 $\begin{array}{l} \underline{a} \quad \mathrm{Na_2S_2O_4}, \ \mathrm{NaHCO_3}, \ (\mathrm{C_{10}H_{21}})_3 \mathrm{NMe}^+ \mathrm{Cl}^- \ (\mathrm{PhH-H_2O}, \ \mathrm{reflux}); \\ \underline{b} \quad \mathrm{NaBH_4} \quad (\mathrm{THF-MeOH}, \ 5 \ ^{\circ}\mathrm{C}); \\ \underline{c} \quad \mathrm{NaBH_4}, \ \mathrm{CeCl_3} \cdot \mathrm{6H_2O} \quad (\mathrm{THF-MeOH}, \ 5 \ ^{\circ}\mathrm{C}). \end{array}$ 

phase transfer conditions.<sup>18</sup> Further reduction of **19** with NaBH<sub>4</sub> in tetrahydrofuran-methanol then gave a mixture of alcohols (**20**), which was not resolvable on analytical HPLC.<sup>19</sup> Reduction of the enone (**17**) under similar conditions gave a TLC-resolvable mixture of the two C-24 epimeric allylic alcohols (**21** and **22**), together with some **20**, which ran on TLC with the less polar isomer (**21**), but was resolvable on analytical HPLC (ratio:- **20**, 13 : **21**, 48 : **22**, 39). Performing this reaction in the presence of an equivalent amount of CeCl<sub>3</sub>·6H<sub>2</sub>O<sup>20</sup> reduced the proportion of side chain saturated

+sio<sup>w</sup> osi+ 21 (less polar isomer)

22 (more polar isomer)

alcohols (20) to <u>ca</u>. 1% of the mixture, and this modification was used preparatively. Isolation of practically pure samples of 21 and 22 was achieved after chromatography and recrystallisation. The integrity of the (<u>E</u>)-configuration of  $\Delta^{22}$  in 21 and 22 was confirmed by their reconversions to 17 by MnO<sub>2</sub> oxidation in dichloromethane. The configurations at C-24 were assigned on the basis of the results of epoxidation reactions of the side chain allylic alcohol moiety under Sharpless' "kinetic resolution" conditions.<sup>21</sup>

Sharpless' group has demonstrated<sup>22</sup> that for chiral secondary allylic alcohols,<sup>23</sup> the Katsuki and Sharpless<sup>24</sup> chiral oxidation system derived from a (+)-tartrate ester reacts faster with the  $\underline{S}$  enantiomer<sup>\*</sup> than with the  $\underline{R}$  enantiomer (and <u>vice versa</u>), the faster reactions proceeding with high <u>anti</u> selectivity and the slower reactions proceeding with poor selectivity. These results reflect the combined effects of an enantiofacial discrimination of the (+)- or (-)-reagent on the one hand, and an <u>anti</u> selectivity for both on the other hand, which effects can either be consonant or dissonant. Thus, one of the enantiomers of the allylic alcohol was selectively removed from a mixture (the racemate) by allowing the reaction to proceed to the desired conversion.<sup>22</sup>

It was hoped that the <u>diastereoisomeric</u> allylic alcohols (21 and 22) could be regioselectively epoxidised under similar conditions and moreover that they would exhibit sufficiently different reaction rates to enable a clear comparison with Sharpless' experiments, and this proved to be the case. Thus, treatment of 21 and 22 with a deficiency ( $\underline{ca}$ . 0.9 molar equiv.) of <u>t</u>-BuOOH in the presence of Ti(OPr<sup><u>1</u></sup>)<sub>4</sub> (1.2 equiv.) and optically active diethyl tartrate (DET) (1.5 equiv.) in dichloromethane at -20°C resulted in clean partial conversion to two different pairs of more polar products. These four products each gave the UV-spectrum characteristic of the 5(<u>E</u>)-vitamin D conjugated triene system and (distinguishable) high field <sup>1</sup>H- and <sup>13</sup>C-NMR spectra consistent with the gross epoxy-alcohol structures 23 to 26. The reaction courses of comparative experiments on mixtures of 21 and 22 with the (+)- or (-)-DET reagent were followed over several days by HPLC

<u>a</u> <u>t</u>-BuOOH, Ti(OPr<sup><u>i</u>)<sub>4</sub>, diethyl tartrate (CH<sub>2</sub>Cl<sub>2</sub>, -20 °C).</sup>

\* Assignment of configuration here assumes the alkenyl group to have a higher priority than the (cyclo-) alkyl substituent of the carbinol, as is the case for 21 and 22. and showed (see Experimental) that: (i) the (-)-DET system reacted considerably faster with 21 than with 22; (ii) the (+)-DET system reacted considerably faster with 22 than with 21. From these observations, 21 is assigned the  $(24\underline{R})$  configuration and 22 the  $(24\underline{S})$  configuration by juxtaposition with Sharpless' results. Furthermore, in close correspondance with the model (see Note 23): (iii) the relatively fast reaction of 21 (with (-)-DET) gave almost exclusively (96:4) one of the two possible isomers, which is thus assigned the <u>anti</u> stereochemistry, 23, while the slower reaction of 21 (with (+)-DET) gave a <u>ca</u>. 1:2 mixture of 23 and 24; and (iv) the relatively fast reaction of 22 (with (+)-DET) gave almost exclusively (98:2) one of the two other possible isomers, also assigned the <u>anti</u> stereochemistry, 25, while the slower reaction of 22 (with (-)-DET) gave a <u>ca</u>. 1:1 mixture of 25 and 26.<sup>25</sup> (All these ratios were approximately constant over the observed reaction period).

It was therefore assumed<sup>21</sup> that the intermediate 22 would lead to the target compound having the required projection of the 24-hydroxyl group, as represented in  $1.24(\underline{R})-(OH)_2-D_2$  (3),<sup>26</sup> and this was supported by the observed greater biological activity of the target compound (4) derived from 22 than of that (29) derived from 21. Thus, clean photoisomerisation<sup>27</sup> in toluene (using anthracene as triplet-sensitiser) of 21 and 22 to the oily (5<u>2</u>)-vitamin derivatives 27 and 28, respectively, followed by removal of the alcohol protective groups with tetrabutylammonium fluoride in tetrahydrofuran completed the syntheses of the crystalline  $1\alpha$ , 24-dihydroxyvitamin D analogues 29 and 4.

<u>a</u> Anthracene - h $\nu$  (toluene, 20 °C); <u>b</u> <u>n</u>-Bu<sub>A</sub>N<sup>+</sup> F<sup>-</sup> (THF, 60 °C).

Compound 4 (which has been given our company code MC 903) mediates effects on cell proliferation and differentiation comparable to those of  $1,25-(OH)_2-D_3$  (2),<sup>28</sup> while **29** is at least 10 times less active.<sup>29</sup> In vivo studies in rats show that **4** is 100-200 times less potent than  $1,25-(OH)_2-D_3$  in its effects on calcium metabolism. The details of the biological testing will be published elsewhere.<sup>28</sup> MC 903 is currently undergoing clinical trials in the therapy of psoriasis.

#### EXPERIMENTAL

Molting points were determined with a Büchi-Tottoli apparatus and are uncorrected. UV spectra ( $\lambda$ ) were measured for solutions in 96% EtOH on a Perkin-Elmer model Lambda 5 spectrophotometer. IR spectra ( $\nu$ ) were obtained on a Perkin Elmer model 763 spectrophotometer for KBr discs unless indicated otherwise (CHCl<sub>3</sub>), in which case CHCl<sub>3</sub> solutions were employed. A refers to <sup>1</sup>H-NMR spectra run at 100 MHz on a Jeol FX100 spectrometer unless otherwise stated. <sup>13</sup>C-NMR and high field <sup>1</sup>H-NMR were run on a Bruker AC-300 spectrometer. Samples were run in CDCl<sub>3</sub> solution using Me<sub>4</sub>Si as internal standard. Coupling constants ( $\underline{J}$ ) are given in Hertz and are usually approximated to the nearest unit. Where assignments of signals are given, the numbering of carbon atoms is that used in the Discussion Section (see diagram 1), which may differ from that in the Titles. Mass spectra were run on a VG7005, It should be noted that the (6§) and ( $\underline{R}$ ) series SO<sub>2</sub>-adducts of vitamin D-type derivatives give the same mass spectra, which is that of the corresponding desulphonated compound.

### Synthesis of MC 903

Analytical TLC (to which  $R_f$  values refer) was performed on Merck plates pre-coated with silica gel 60  $F_{254}$ . Analytical HPLC (to which  $T_R$  values refer) was performed on a Lichrosorb Si 60 column (25 cm x 4 mm) at a flow rate of 3 ml/min. Chromatography was performed on silica gel. In general, the separations were performed on a Waters Associates Prep LC/System 500A, but when a weight of silica gel is given, then this refers to flash chromatography using Merck Kieselgel 60. Organic solutions were dried over anhyd. MgSO<sub>4</sub>. Petro-leum ether refers to the fraction b.p. < 50°C. Reactions were performed routinely under a nitrogen atmosphere.

 $\frac{3(\underline{s})-(\underline{tert}-\underline{Butyldimethylsilylox})-9,10-\underline{seco-ergosta-5,7(\underline{s}),10(19),22(\underline{s})-\underline{tertaene} (\underline{6\underline{s}}) (\underline{7}\underline{a}) and (\underline{6\underline{R}}) (\underline{7}\underline{b}) SO_2^{-1}}{\underline{adducts}}.$  Vitamin  $D_2$  (12.5 g, 31.5 mmol) was dissolved in liquid  $SO_2$  (50 ml). The solution was stirred under reflux for 30 min. The  $SO_2$  was distilled off, and the residue was dried  $\underline{in}$  vacuo to give a mixture of the known<sup>13a</sup> vitamin  $D_2$  (6<u>5</u>) and (6<u>R</u>)  $SO_2^{-1}$  adducts (<u>§</u>) as a foam. This was dissolved in DMF (100 ml), and imidazole (4.5 g, 66 mmol) and TBDMS chloride (5.0 g, 33 mmol) were added. The mixture was stirred at 20°C for 90 min and then partitioned between EtOAC (500 ml) and water (200 ml). The organic layer was washed twice with water in petroleum other as cluant) to give the (<u>6S</u>)  $SO_2^{-1}$  adduct (<u>7</u>a), less polar isomer, as needles (9.4 g, 52k), m.p. 117-118°C dec. (from CH<sub>2</sub>Cl<sub>2</sub>-EtOH) (Found: C, 70.96, H, 10.15; S, 5.54,  $C_{34}H_{58}O_3SSi$  requires C, 71.02; H, 10.17; S, 5.58k); & 0.06 (6 H, s), 0.67 (3 H, s), 0.88 (9 H, s), 1.03 (3 H, d, <u>J</u> 7), 3.64 (2 H, broad s), 4.0 (1 H, m), 4.4-4.8 (2 H, 2 broad d, <u>J</u> 10) and 5.2 (2 H, m); <u>m/z</u> 510 (<u>M</u><sup>+</sup> - SO<sub>2</sub>, 40), 495 (2), 453 (10), 385 (3), 378 (8). 253 (26), 251 (12), 193 (50), 119 (100), and 118 (46k), and the (<u>6R</u>)  $SO_2^{-adduct} (<u>7</u>b),$  more polar isomer, as needles (7.7 g, 42k), m.p. 121-122°C dec. (from CH<sub>2</sub>Cl<sub>2</sub>-EtOH) (Found: C, 70.99; H, 10.20; S, 5.52.  $C_{34}H_{58}O_3SSi}$  requires C, 71.02; H, 10.17; S, 5.58k);  $\delta$  0.06 (6 H, m), 121-122°C dec. (from CH<sub>2</sub>Cl<sub>2</sub>-EtOH) (Found: C, 70.99; H, 10.20; S, 5.52.  $C_{34}H_{58}O_3SSi}$  requires C, 71.02; H, 10.17; S, 5.58k);  $\delta$  0.06 (6 H, m), 4.5-4.9 (2 H, 2 broad d, <u>J</u> 10, 1.17; S, 5.58k);  $\delta$  0.06 (6 H, s), 0.56 (3 H, s), 0.58 (3 H, s), 0.88 (9 H, s), 1.02 (3 H, d, <u>J</u> 7), 3.65 (2 (A), 251 (12), 193 (50), 119 (100), and 118 (46k), and the (<u>6R</u>)  $SO_2^{-1}$  adduct (<u>7</u>b), more polar isomer, as needles (7.7 g, 42k), m.p. 121-122°C dec. (from CH<sub>2</sub>Cl<sub>2</sub>-EtOH) (Found: C, 70.99; H, 10.20; S, 5.52.

l(S),3(R)-Bis(tert-butyldimcthylsilyloxy)-9,10-seco-ergosta-5(E),7(E),10(19),22(E)-tetraene (1) and 1(R),3(R) $bis(\underline{tert}-butyldimethylsilyloxy)-1,10-seco-ergosta-5(\underline{E}),7(\underline{E}),10(19),22(\underline{E})-tetraene(\underline{12}).$  The (6<u>5</u>) (<u>7</u>3) or (6<u>R</u>) (7b) SO2-adduct, or a mixture of these, (16.4 g, 28.5 mmol) was suspended in 96% ethanol (250 ml) and sodium hydrogen carbonate (20 g) was added. The stirred mixture was heated under reflux for 90 min, cooled, parti-The organic layer was washed ally concentrated in vacuo, and partitioned between ethyl acetate and water. consecutively with water and brine, dried and concentrated to give the known<sup>12</sup> (5<u>E</u>)-vitamin  $D_2$  TBDMS other (g) as an oil. This was dissolved in a solution of N-methylmorpholine N-oxide in  $CH_2Cl_2$ , which had been prepared by drying (30 min over  $MgSO_4$ ) a solution containing <u>N</u>-methylmorpholine <u>N</u>-oxide monohydrate (16 g, 119 mmol) in CH<sub>2</sub>Cl<sub>2</sub> (160 ml) and filtering. The stirred solution was heated under reflux, and a solution of solenium dioxide (3.0 g, 27 mmol) in methanol (160 ml) was added rapidly. Heating under reflux was continued for 50 min before the reaction mixture was cooled, diluted with more dichloromethane, washed consecutively with water and brine, dried and concentrated to give a mixture of the known<sup>12</sup> (1<u>5</u>)- ( $\frac{1}{2}$ ) and (1<u>R</u>)- ( $\frac{1}{2}$ ) hydroxy-5(<u>E</u>)vitamin D<sub>2</sub> TBDMS ethers as an orange foam of sufficient purity for use in the next stage. Analytical HPLC (1% EtOAc in hexame as cluant; detector wavelength 270 nm) showed the product to contain 9,  $T_{\rm R}$  9.5 min, and 10, T<sub>R</sub> 7.2 min, in a 6:1 proportion. The product was dissolved in DMF (80 ml), and imidazole (4.3 g, 63 mmol) and TBDMS chloride (5.1 g, 34 mmol) were added. The mixture was stirred at 20°C for 90 min and then partitioned between EtOAc (450 ml) and water (200 ml). The EtOAc layer was washed twice with water and brine, dried and concentrated to give a crystalline solid which was purified by filtration through silica gel (200 g) (cluting with 1% ether in petroleum ether) followed by recrystallisation from  $Et_2O$ -EtOH to give the (<u>15</u>)-bis-TBDMS ether (11), less polar isomer, as needles (5.7 g), m.p. 113-114°C (Found: C, 75.04; H, 11.33; C40H72<sup>0</sup>2<sup>S1</sup>2 reguires C, 74.93; H, 11.32%);  $\lambda_{max}$  270 nm (£ 25900); 5 0.07 (12 H, s), 0.57 (3 H, s), 0.88 (9 H, s), 0.91 (9 H, s), 1.03 (3 H, d, J 7), 4.22 (1 H, m), 4.54 (1 H, dd, J 5 and 9), 4.97 (2 H, m), 5.20 (2 H, m), 5.82 (1 H, d, 길 ll), and 6.47 (l H, d, <u>J</u> ll); <u>m/z</u> 640 (<u>변</u><sup>\*</sup>, 12), 625 (2), 583 (5), 515 (2), 508 (49), 451 (6), 383 (10), 379 (5), 355 (3), and 248 (100%). The mother liquor from the recrystallisation of  $\c l$  was concentrated and purified by chromatography (1% ether in petroleum ether as eluant) to give the  $(\underline{1R})$ -isomer ( $\underline{12}$ ) (1.2 g, 7%) as an oil/ foam,  $\lambda_{max}$  269 nm (  $\epsilon$  22000);  $\delta$  0.08 (12 H, s), 0.59 (3 H, s), 0.90 and 0.93 (each 9 H, s), 1.03 (3 H, d, J 7), 3.68 and 4.05 (each 1 H, m), 5.04 and 5.20 (each 2 H, m), 5.84 and 6.52 (each 1 H, d, J 11);  $\underline{m}/\underline{z}$  640 ( $\underline{M}^+$ ) and 248, and an additional 1.2 g (after recrystallisation, as above) 11 (total yield 6.8 g, 37% from 7).

 $\frac{1(\underline{S}), 3(\underline{R}) - Bis(\underline{tert} - butyldimethylsilyloxy) - 9, 10 - seco-ergosta - 5, 7(\underline{E}), 10(19), 22(\underline{E}) - tetraene (6\underline{S}) (\underline{1}\underline{a}) and (6\underline{R})}{(\underline{1}\underline{b}) \underline{SO}_2 - adducts}$ . The bis-TBOMS ether (<u>1</u>) (4.0 g, 6.2 mmol) was dissolved in Et<sub>2</sub>O (10 ml) and liquid SO<sub>2</sub> (50 ml) and the mixture was stirred under reflux for 30 min. The SO<sub>2</sub> and ether were distilled off, and the residue was dired <u>in vacuo</u> to give white needles (4.4 g, 100%), showing two spots on TLC (10% Et<sub>2</sub>O in petro-leum ether as eluant) corresponding to <u>1</u><u>la</u> (R<sub>f</sub> <u>ca</u>. 0.25) and <u>1</u><u>ls</u> (R<sub>f</sub> <u>ca</u>. 0.1) (Found: C, 67.97; H, 10.26) S, 4.37. C<sub>40</sub>H<sub>72</sub>O<sub>4</sub>S Si<sub>2</sub> requires C, 68.12; H, 10.29; S, 4.55%);  $\delta$  0.57 and 0.66 (2 s; relative heights, 1:3.3). Separation by chromatography (eluting with 20% Et<sub>2</sub>O in petroleum ether) gave the (<u>6S</u>) <u>SO<sub>2</sub>-adduct</sub> (<u>1</u><u>3</u>) as needles, m.p. 107-109°C dec. (from Et<sub>2</sub>O-MeOH) (Found: C, 67.89; H, 10.24; S, 4.35. C<sub>40</sub>H<sub>72</sub>O<sub>4</sub>S Si<sub>2</sub> requires C, 68.12; H, 10.29; S, 4.55%);  $\delta$  0.56 (12 H, br s), 0.66 (3 H, s), 0.87 (9 H, s), 0.89 (9 H, s), 1.02 (3 H, d, <u>j</u> 7), 3.45-4.1 (2 H, br ABG, <u>j</u> 16), 4.20 (1 H, m), 4.35 (1 H, m), 4.67 (2 H, m), and 5.19 (2 H, m), and the (<u>6R</u>) <u>SO<sub>2</sub>-adduct</sub> (<u>1</u><u>S</u>) as an oil;  $\nu_{max}$  (CHCl<sub>3</sub>) 1310 and 1160 cm<sup>-1</sup>;  $\delta$  0.06 (12 H, br ABG, <u>j</u> 16), 4.20 (1 H, m), 4.35 (1 H, m), 4.67 (2 H, m), and 5.19 (2 H, m), and the (<u>6R</u>) <u>SO<sub>2</sub>-adduct</sub> (<u>1</u><u>S</u>) as an oil;  $\nu_{max}$  (CHCl<sub>3</sub>) 1310 and 1160 cm<sup>-1</sup>;  $\delta$  0.06 (12 H, br ABG, <u>j</u> 16), 4.20 (1 H, m), 4.55 (1 H, m), 4.67 (2 H, m), and 5.19 (2 H, m), and the (<u>6R</u>) <u>SO<sub>2</sub>-adduct</sub> (<u>1</u><u>S</u>) as an oil;  $\nu_{max}$  (CHCl<sub>3</sub>) 1310 and 1160 cm<sup>-1</sup>;  $\delta$  0.06 (12 H, br ABG, <u>j</u> 16), 4.20 (1 H, m), 4.55 (1 H, m), 4.67 (2 H, m), and 5.19 (2 H, m), and the (<u>6R</u>) <u>SO<sub>2</sub>-adduct</sub> (<u>1</u><u>S</u>) as an oil;  $\nu_{max}$  (CHCl<sub>3</sub>) 1310 and 1160 cm<sup>-1</sup>;  $\delta$  0.06 (12 H, br s), 0.57 (3 H, s), 0.87 and 0.89 (each 9 H, s), 1.02 (3 H, d, <u>j</u> 7), 3.45-4.1 (2 H, br ABg, <u>j</u> 16), 4.15 (1 H, m), 4.4 (1 H, m), 4.5-4.95 (2 H, 2 br d, <u>j</u> 10).</u></u></u></u></u>

 $\frac{1(\underline{S}),3(\underline{R})-\underline{Bis}(\underline{tert}-\underline{butyldimethylsilyloxy})-20(\underline{S})-\underline{formyl-9,10-secopregna-5,7(\underline{E}),10(19)-\underline{triene}}{(\underline{6S})}$ The ( $\underline{6S}$ ) SO<sub>2</sub>-adduct ( $\underline{13a}$ ) (4.4 g, 6.2 mmol) was dissolved in CH<sub>2</sub>Cl<sub>2</sub> (120 ml) and MeOH (40 ml). The stirred solution was cooled to -65°C and treated with ozonised oxygen until TLC showed essentially complete consumption of starting material ( $\underline{ca}$ . 40 ml). The solution was then purged with N<sub>2</sub>, and PPh<sub>3</sub> (2.5 g, 9.5 mmol) was added. After warming slowly to 0°C, the reaction mixture was diluted with more CH<sub>2</sub>Cl<sub>2</sub>, washed consecutively with 5% NaHCO<sub>3</sub> solution, water, and brine, and dried and concentrated. The residue was purified by chromatography (30% ether in petroleum ether as eluant) to give the <u>aldehyde</u> ( $\underline{14a}$ ) as needles (3.2 g, 81%), m.p.

122-124°C dec. (Found: C, 64.33; H, 9.59; S, 4.87.  $C_{34}H_{60}O_5S$  Si<sub>2</sub> requires C, 61.10; H, 9.49, S, 5.03%);  $\nu_{max}$  (CHCl<sub>3</sub>) 1720, 1310 and 1160 cm<sup>-1</sup>;  $\delta$  0.06 (12 H, br s), 0.70 (3 H, s), 0.87 and 0.88 (18 H, 2 s), 1.13 (3 H, d, J 7), 3.45-4.1 (2 H, br AB q, J 16), 4.20 (1 H, m), 4.35 (1 H, m), 4.70 (2 H, m), and 9.58 (1 H, d, J 3). [N.B. The use of the (6<u>R</u>) SO<sub>2</sub>-adduct (1<u>3</u>b) as starting material in this preparation gives the aldehyde (<u>14</u>b), more polar isomer, in the same yield, as an oil;  $\nu_{max}$  (CHCl<sub>3</sub>) 1720, 1310 and 1160 cm<sup>-1</sup>;  $\delta$  0.07 (12 H, br s). 0.61 (3 H, s), 0.88 and 0.89 (18 H, 2 s), 1.14 (3 H, d, J 7), 3.45-4.1 (2 H, br AB q, J 16), 4.15 (1 H, m), 4.4 (1 H, m), 4.5-4.95 (2 H, 2 br d, J 10), and 9.57 (1 H, d, J 3)]

 $\frac{1(\underline{S}),3(\underline{R})-\underline{Bis}-(\underline{tert}-\underline{butyldimethylsilyloxy})-20(\underline{S})-formyl-9,10-secopregna-5(\underline{E}),7(\underline{E}),10(19)-triene~(\underline{LS}).$  The aldehydes ( $\underline{I}_{\underline{S}}$ ) (14.3 g, 22 mmol) were suspended in ethanol (300 ml) and NaHCO<sub>3</sub> (14 g) added. The stirred mixture was heated under reflux for 90 min, cooled, partially concentrated in <u>vacuo</u>, and partitioned between EtOAc (350 ml) and water (200 ml). The organic layer was washed with water and brine, dried, and concentrated to give a crystalline product (12.6 g) which was used as such in the next step. Analytical HPLC (18 EtOAc in becames as eluant; detector wavelength 270 nm) showed the product to contain the aldehyde ( $\underline{I}_{\underline{S}}$ ) (90%), T<sub>R</sub> 4.8 min, and its (20<u>R</u>) epimer (1<u>6</u>) (5%), T<sub>R</sub> 4.1 min, and these were separated from a sample by chromatography (5% Et<sub>2</sub>O in petroleum ether as eluant): 1<u>5</u>, needles, m.p. 113-115°C (from EtOH) (Found: C, 71.16; H, 10.54. ### $\underline{Cyclopropylcarbonylmethylenetriphenylphosphorane (\underline{L})}.$

<u>A. Bromoacetylcyclopropane</u>. To a stirred, ice-cooled solution of cyclopropyl methyl ketone (21 g, 0.25 mol) in methanol (150 ml) was added bromine (40 g, 0.25 mol). The reaction was allowed to proceed (decolourisation) below 10°C. Stirring was then continued at room temperature for 30 min before water (75 ml) was added. After a further 15 min the mixture was diluted with water (225 ml) and extracted four times with  $Et_20$ . The ether extracts were washed with 10%  $Na_2CO_3$  solution, water, brine, and dried. After removing the solvent in vacuo, the residue was distilled to give bromoacetylcyclopropane (35.5 g, 87%), b.p. 71-73°C/13 mmHg;  $\wedge$  0.9-1.3 (4 H, m), 2.05-2.35 (1 H, m), and 4.02 (2 H, s).

<u>B. Cyclopropylcarbonylmethyltriphenylphosphonium bromide</u>. Bromoacetylcyclopropane (27.1 g, 0.17 mol) and triphenylphosphine (43.5 g, 0.17 mol) were mixed and allowed to react spontaneously (exothermic reaction). The resulting solid cake was dissolved in  $CH_2Cl_2$  (200 ml) (with warming) and treated with  $Et_2O$  (300 ml) to precipitate the <u>phosphonium bromide</u> as colourless needles (59.1 g, 84%), m.p. 214-215°C (Found: C, 64.81; H, 5.26.  $C_{23}H_{22}OBrP$  requires C, 64.95; H, 5.21%); & 1.02 (4 H, m), 2.75 (1 H, m), 5.89 (2 H, d, <u>J</u> 12), and 7.45-8.0 (15 H, m).

C. Cyclopropylcarbonylmethylenetriphenylphosphorane ( $\underline{I}$ ). The phosphonium bromide from B (67 g, 158 mmol) was dissolved in CH<sub>2</sub>Cl<sub>2</sub> (900 ml), and the solution was extracted with sodium hydroxide solution (2 N, 900 ml). The organic layer was washed with brine, dried and concentrated <u>in vacuo</u> to give a product which was purified by recrystallisation from dichloromethane-acetone to give the <u>phosphorane</u> ( $\underline{I}$ ) as needles (46.6 g, 86%), m.p. 181-182°C (Found: C, 79.99; H, 6.24; C<sub>23</sub>H<sub>21</sub>O P requires C, 80.22; H, 6.15%);  $\delta$  0.60 (2 H, m), 0.85 (2 H, m), 1.75 (1 H, m), 3.77 (1 H, br d,  $\underline{J}$  26) and 7.1-7.8 (15 H, m).

[20(<u>R</u>) (<u>17</u>) and 20(<u>S</u>) (<u>18</u>)] 1(<u>S</u>), 3(<u>R</u>)-Bis(<u>tert</u>-butyldimethylsilyloxy)-20-(3'-cyclopropyl-3'-oxyprop-1'(<u>E</u>)-

enyl)-9,10-secopregna-5( $\underline{E}$ ),7( $\underline{E}$ ),10(19)-triene. A stirred solution of the aldehyde mixture 15/16 (10.5 g) from the SO<sub>2</sub>-extrusion step and the phosphorane  $\underline{I}$  (15 g, 44 mmol) in dimethyl sulphoxide (60 ml) was heated at 105°C for 4 h. After cooling, the reaction solution was partitioned between EtOAc (250 ml) and water (200 ml). The ethyl acetate layer was washed twice with water and brine, dried, and concentrated in vacuo to give a residue which was purified by chromatography (108 ether in petroleum ether as eluant) and recrystallisation to give the 20(R) enone (17), more polar isomer, as needles, m.p. 123-124°C (from Et<sub>2</sub>O-MeOH) (7.51 g, 638 from 14) (Found: C, 73.24; H, 10.48. C<sub>39</sub> H<sub>60</sub>O<sub>3</sub>Si<sub>2</sub> requires C, 73.29; H, 10.418;  $\lambda_{max}$  230 and 270 (c 21200 and 26800);  $\nu_{max}$  1687, 1668 and 1626 cm<sup>-1</sup>;  $\delta$  0.06 (12 H, s), 0.59 (3 H, s), 0.87 and 0.90 (each 9 H, s), 1.13 (3 H, d,  $\underline{J}$  7), 4.2 (1 H, m), 4.5 (1 H, m), 4.96 (2 H, m), 5.8 (1 H, d,  $\underline{J}$  11 Hz), 6.14 (1 H, d,  $\underline{J}$  16 Hz), 6.45 (1 H, d,  $\underline{J}$  11 Hz), and 6.78 (1 H, dd,  $\underline{J}$  9 and 16 Hz);  $\underline{m}/\underline{Z}$  638 ( $\underline{M}^+$ , 10), 623 (2), 581 (7), 506 (54), 449 (8), 383 (6), 379 (10), 355 (2), and 248 (1008). The mother liquor was concentrated and rechromatographed and the fractions containing the less polar isomer combined with those from the first column to give the 20(S) enone (18) (0.45 g, 4% from 14), needles, m.p. 97-99°C (from Et\_20-MeOH) (Found: C, 73.26, H, 10.38. C<sub>39</sub>H<sub>60</sub>O<sub>3</sub>Si<sub>2</sub> requires C, 73.29; H, 10.418);  $\lambda_{max}$  230 and 269 nm (£20500 and 26400);  $\nu_{max}$  1667 and 1625 cm<sup>-1</sup>,  $\delta$  0.06 (12 H, s), 0.52 (3 H, s), 0.87 and 0.90 (each 9 H, s), 1.03 (3 H, d,  $\underline{J}$  7), 4.2 (1 H, m), 4.5 (1 H, m), 4.96 (1 H, d,  $\underline{J}$  11), 6.14 (1 H, d,  $\underline{J}$  16), 6.45 (1 H, d,  $\underline{J}$  11) and 6.81 (1 H, dd,  $\underline{J}$  9 and 16);  $m/\underline{z}$  638 ( $\underline{M}^+$ ) and 248.

 $\frac{i(S), 3(R)-Bis(tert-butyldimethylsilyloxy)-20(R)-(3'-cyclopropyl-3'-oxopropyl)-9, 10-secopregna-5(E), 7(E), 10(19)-triene (19). A mixture of the enone (17) (200 mg, 0.3 mmel), NaHCO<sub>3</sub> (0.5 g), sodium dithionite (Na<sub>2</sub>S<sub>2</sub>O<sub>4</sub>) (0.5 g), and methyltridecylammonium chloride (0.05 g) in benzene (10 ml) and water (10 ml) was stirred vigorously under reflux for 90 min. After cooling, the reaction mixture was partitioned between Et<sub>2</sub>O and water, and the organic layer was washed with water, dried and concentrated <u>in vacuo</u>. The residue was purified by chromatography (silica gel, 30 g; 5% Et<sub>2</sub>O in petroleum ether) to give the <u>ketone</u> (19) (144 mg, 72%) as colourless plates, m.p. 93-94°C (from ether-methanol) (Found: C, 73.07; H, 10.70, C<sub>39</sub>H<sub>6</sub>B<sub>0</sub><sub>3</sub> Si<sub>2</sub> requires C, 73.06; H, 10.69%); <math>\nu_{max}$  (KBr) 1700 cm<sup>-1</sup>; 6 0.06 (12 H, s), C.55 (3 H, s), 0.67 and 0.90 (each 9 H, s), 625 (2), 583 (3), 508 (36), 451 (6), 383 (3), 379 (5), 355 (3), and 248 (100%);  $\lambda_{max}$  270 nm (£ 24900).

 $\frac{1(\underline{S}), 3(\underline{R}) - Bis(tert-butyldimethylsilyloxy) - 20(\underline{R}) - (3'\underline{\xi} - cyclopropyl-3' - hydroxypropyl) - 9, 10-secopregna-5(\underline{E}), 7(\underline{E}), -10(19) - triene (20). An ice-cooled, stirred solution of the ketone (19) (225 mg, 0.35 mmol) in tetrahydrofuran (3 ml) was diluted with methanol (8 ml) and treated with NaBH<sub>4</sub> (140 mg) portionwise over 5 min. After a further 10 min, the reaction mixture was partitioned between ethyl acetate (30 ml) and water (30 ml), and the organic layor was washed with water, dried, and concentrated in vacuo to give the side chain saturated alcohols (20) as a gum (0.22 g, 998); <math>\lambda_{max}$  270 mm;  $\hat{0}$  0.06 (12 H, s), 0.15-0.55 (4 H, m), 0.55 (3 H, s), 0.86 and 0.90 (each 9 H, s), 4.2 (1 H, m), 4.55 (1 H, m), 4.96 (2 H, m), 5.81 (1 H, d, <u>J</u> 11.5) and 6.46 (1 H, d, <u>J</u> 11.5);  $\delta_{\underline{C}}$  (75.5 MHz) -5.1 and -4.9 (SiCH<sub>3</sub>'s); 2.0, 2.3, 2.5 and 2.7 (C-26,27); 11.9 (C-18); 17.8, 17.9 and 18.1 (C-25 and SiC(CH<sub>3</sub>'s); 18.6 and 18.7 (C-21); 22.1 (C-11); 23.4 (C-15); 25.7 (CH(CH<sub>3</sub>'s); 27.5 (C-16), 28.8 (C-9); 31.5 and 31.6 (C-23); 33.5 and 33.7 (C-22); 35.8 and 36.0 (C-20); 36.4 (C-4), 40.4 (C-12), 43.8 (C-1); 41.6 (C-6), 135.2 (C-14), 67.1 (C-3), 70.1 (C-1), 77.0 and 77.2 (C-24), 106.4 (C-19), 116.3 (C-7), 121.6 (C-6), 135.2 (C-5), 143.1 (C-8) and 153.5 (C-10). (See Note 19.)

3'(R) (21) and 3'(S) (22) 1(S),3(R)-Bis(tert-butyldimethylsilyloxy)-20(R)-(3'-cyclopropyl-3'-hydroxyprop- $\frac{1'(\underline{E})-\text{enyl})-9,10-\text{secopregna}-5(\underline{E}),7(\underline{E}),10(19)-\text{trione}$ . An ice-cooled, stirred solution of the enone (17) (4.31 g, 6.74 mmol) in tetrahydrofuran (8 ml) was diluted with 0.4 M CeCl 3.6820 in methanol (18 ml) and further with methanol (9 ml), and treated with sodium borohydride (0.50 g), portionwise over 5 min. After a further 10 min, the reaction mixture was partitioned between EtOAc (250 ml) and water (200 ml) and the organic layer was washed with water ( 100 ml), dried, and concentrated <u>in</u> <u>vacuo</u>. HPLC analysis (using 4% BtOAc in hexanes as eluant; detector wavelength 270 nm) showed the product to be a mixture of the allylic alcohols (21) and (22)and the side chain saturated alcohols (20) described above ( $T_{R}$  ca. 10, 12, and 8 min, respectively) in the proportions 61:38:1. Purification by chromatography (10% ethyl acetate in petroleum ether as eluant) gave the <u>3'(B) allylic alcohol</u> (<u>21</u>), less polar isomer, (2.37 g, 55%) as needles, m.p. 117-118°C (from petroleum ether-MeOH) (Found: C,72.73; H,10.74.  $C_{39}H_{68}O_3$  S1<sub>2</sub> requires: C, 73.06; H,10.69%);  $\lambda_{max}$  270 ( $\epsilon$  25000);  $\delta$  0.06 (12 H, s), 0.15-0.65 (4 H, m), 0.57 (3 H, s), 0.87 and 0.90 (18 H, 2 s), 1.05 (3 H, d, J 7 Hz), 3.45 (1 H, m), 4.2 (1 H, m), 4.55 (1 H, m), 4.96 (2 H, m), 5.51 (2 H, m), 5.82 (1 H, d, J 11 Hz) and 6.47 (1 H, d, 𝔅 ] Hz);  $𝔅/𝔅_2$  640 ( $𝔅/𝔅^+$ , 6), 625 (1), 623 (1), 583 (2), 508 (29), 493 (1), 490 (2), 451 (3), 383 (6), 379 (5), 355 (2), and 248 (100%), and the <u>3'(S) allylic alcohol</u> (22) (1.42 g, 33 %) as needles, m.p. 122-123°C (from petroleum ether-MeOH) (Found: C,72.22; H,10.65. C39H6803 S12 requires: C,73.06; H,10.69%); A max 270 (£ 24100); 6 0.06 (12 H, s), 0.15-0.65 (4 H, m), 0.57 (3 H, s), 0.87 and 0.90 (18 H, 2 s), 1.05 (3 H, d, J 7 Hz), 3.45 (1 H, m), 4.2 (1 H, m), 4.55 (1 H, m), 4.96 (2 H, m), 5.47 (2 H, m), 5.82 (1 H, d, J 11 Hz) and 6.47 (1 H, d, J 11 Hz);  $\underline{m}/\underline{z}$  640 ( $\underline{M}^+$ ) and 248.

Epoxidation of 21 and 22 under Sharpless' kinetic resolution conditions;  $\begin{bmatrix} 1 & (R) & 2 & (R) \\ 0 & 0 & 0 \end{bmatrix}$ , (23), 1'(S), 2'(S), 3'(R) (24), 1'(S), 2'(S), 3'(S) (25), and 1'(R), 2'(R), 3'(S) (26) 1(S), 3(R)-(3'-cyclopropyl-1',2'-epoxy-3'-hydroxypropyl)-9,10-secopregna-5(E), 7(E), 10(19)-triene. Four parallel experiments were performed as follows:-  $T_1(OPr^{\frac{1}{2}})_4$  (0.28 g, 1 mmol, 1.2 eq.) was weighed into a dry flask which was then sealed with a septum cap. After establishing an  $N_2$  atmosphere, the following liquids were injected sequentially at -20°C:(i) optically active diethyl tartrate (DET) (0.25 g, 1.2 mmol, 1.5 eq.) in CH<sub>2</sub>Cl<sub>2</sub> (7 ml); (ii) a mixture (see t=0 HPLC analysis below) of 21 and 22 (0.52 g, 0.81 mmol, 1 eq.) in CH2C12 (3 ml); (111) azeotropically dried<sup>22</sup> t-BuOOH (1.6 ml, 0.45 M, 0.72 mmol, 0.9 eq.) in (CH<sub>2</sub>Cl)<sub>2</sub>, the latter being added after a 15 min interval. The reaction solution was then maintained at  $\underline{ca}$ ,  $-20^{\circ}C$  (in a freezer, between examinations). At intervals, an aliquot (20 µl) was withdrawn and quenched by partitioning between water (2 ml) and hexane (lml) at 20°C, and the hexame phase analysed directly by HPLC (4% ECOAC in hexames as eluant; detector 270 nm). The results were as follows: [Normalised ratios (± 1%) of components 21-26 (the components being given in that order);  $T_R$ ; 21, 10; 22, 12; 23, 25; 24, 31; 25, 23; 26, 34 min (reaction time in hours)] : Expt 1 [(+)-DET] 48:52:0:0:0:0 (0; starting mixture); 27:0: 7:14: 5: :1 (96); <u>Expt 2</u> [(+)-DET 97:3:0:0:0:0 (0); 90:2:2:5:1:0 (4); 66:0:9:22:3:0 (36); 35:0:20: 12: 1:0 (120). <u>Expt 3</u> [(-)-DET 97:3:0:0:0:0 (0); 49:3:46:2:0:0 (4); 16:3:78:3:0:0 (36); 10:3: 84 : 3:0:0 (120). Expt 4 [(-)-DET] 6:94:0:0:0:0 (0); 0:31:6:0:32: 31 (72). Thus, 21 is removed selectively from either a 97:3 (Expt 3) or a 6:94 (Expt 4) mixture of 21 and 22, showing that (-)-DET reagent reacts faster with 21 than with 22. Similarly, 22 is removed selectively from a ca. 1:1 (Expt 1) [or a 97:3 (Expt2)] mixture of 21 and 22, showing the (+)-DET reagent reacts faster with 22 than with 21. After the last examination the reaction mixture was quenched by partitioning between 5% NaHCO3 solution (20 ml) and EtOAc (50 ml) at 20°C. The mixture was filtered and the organic layer was washed with brine, dried and concentrated to give a residue which was purified by chromatography (silica gel, 100 g, 20% EtOAc in petroleum ether as eluant) to give an oily product [23+25, 137 mg / 24, 147 mg / 23, 276 mg / 26, 85 mg, respectively from Depts 1-4] corresponding to the HPLC peak(s) indicated above in a box in the final HPLC analysis. Thus, the four expts gave each a different isomer, except for Expt 1 which gave a <u>ca</u>. 1:7 mixture of 23 and 25, since those were not separable preparatively. The NMR data obtained (except for Expt 1) did not show any cross-contamination. 23/24/25/26:  $\lambda_{max}$  270 mm;  $\delta_{C}$  (75.5 MHz; common values ± 0.1 p.p.m.; values outside this range are given in the order 23-26 unless otherwise stated) -5.1 and -5.0 (S1<u>C</u>H<sub>3</sub>'s); 1.5/1.5/1.3/2.0 (<u>C</u>-26); 2.4/2.3/2.0/2.3 (<u>C</u>-27); 12.0 (<u>C</u>-18); 13.4 (23, 25)/14.4 (24, 26) (C-25); 17.0 (23, 26)/15.8 (24, 25) (C-21); 17.9 and 18.0 (CH(CH<sub>3</sub>)<sub>3</sub>'s); 22.2 (C-11); 23.2 (C-15); 25.7 (CH(CH<sub>3</sub>)<sub>3</sub>'s); 26.7 (23, 26)/26.1 (24, 25) (C-16); 28.8 (C-9); 36.4 (C-4); 39.1 (23, 26)/38.0 (24, 25) (C-20); 40.2 (C-12); 43.8 (C-2); 46.0 (C-13); 54.0 (23, 26)/56.2 (24, 25) (C-17); 55.8 (C-14); 59.9/ 59.2/58.1/61.4 (<u>C</u>-23); 62.1/61.4/59.4/63.0 (<u>C</u>-22); 67.0 (<u>C</u>-3); 70.1 (<u>C</u>-1); 73.6/75.4/72.8/74.7 (<u>C</u>-24); 106.4 <u>+</u> 0.2 (<u>c</u>-19); 116.5 (<u>c</u>-7); 121.4 (<u>c</u>-6); 135.5 (<u>c</u>-5); 142.5 (<u>c</u>-8); 153.4 (<u>c</u>-10).  $\delta_{\underline{H}}$  (300 MHz) 23: 0.06 and 0.07 (12 H, 2 s, S1C<u>H</u><sub>3</sub>'s), 0.30 - 0.45 (4 H, 2 m, 26-<u>H</u><sub>2</sub> and 27-<u>H</u><sub>2</sub>), 0.55 (3 H, s,  $\overline{18}$ -<u>H</u><sub>3</sub>), 0.61 (1 H, m, 25-<u>H</u>), 0.87 and 0.90 (each 9 H, s, CH(C<u>H</u><sub>3</sub>)<sub>3</sub>), 1.14 (3 H, d, J 6.4, 21-<u>H</u><sub>3</sub>), 2.32 (1 H, br d, J 13.9, 4 $\mu$ -<u>H</u>), 2.55 (1 H, br d, J 13.9, 4 $\mu$ -<u>H</u>), 2.55 (1 H, br d, J 13.9, 4 $\mu$ -<u>H</u>), 2.55 (1 H, br d, J 13.9, 4 $\mu$ -<u>H</u>), 2.55 (1 H, br d, J 13.9, 4 $\mu$ -<u>H</u>), 2.55 (1 H, br d, J 13.9, 4 $\mu$ -<u>H</u>), 2.55 (1 H, br d, J 13.9, 4 $\mu$ -<u>H</u>), 2.55 (1 H, br d, J 13.9, 4 $\mu$ -<u>H</u>), 2.55 (1 H, br d, J 13.9, 4 $\mu$ -<u>H</u>), 2.55 (1 H, br d, J 13.9, 4 $\mu$ -<u>H</u>), 2.55 (1 H, br d, J 13.9, 4 $\mu$ -<u>H</u>), 2.55 (1 H, br d, J 13.9, 4 $\mu$ -<u>H</u>), 2.55 (1 H, br d, J 13.9, 4 $\mu$ -<u>H</u>), 2.55 (1 H, br d, J 13.9, 4 $\mu$ -<u>H</u>), 2.55 (1 H, br d, J 13.9, 4 $\mu$ -<u>H</u>), 2.55 (1 H, br d, J 13.9, 4 $\mu$ -<u>H</u>), 2.55 (1 H, br d, J 13.9, 4 $\mu$ -<u>H</u>), 2.55 (1 H, br d, J 13.9, 4 $\mu$ -<u>H</u>), 2.55 (1 H, br d, J 13.9, 4 $\mu$ -<u>H</u>), 2.55 (1 H, br d, J 13.9, 4 $\mu$ -<u>H</u>), 2.55 (1 H, br d, J 13.9, 4 $\mu$ -<u>H</u>), 2.55 (1 H, br d, J 13.9, 4 $\mu$ -<u>H</u>), 2.55 (1 H, br d, J 13.9, 4 $\mu$ -<u>H</u>), 2.55 (1 H, br d, J 13.9, 4 $\mu$ -<u>H</u>), 2.55 (1 H, br d, J 13.9, 4 $\mu$ -<u>H</u>), 2.55 (1 H, br d, J 13.9, 4 $\mu$ -<u>H</u>), 2.55 (1 H, br d, J 13.9, 4 $\mu$ -<u>H</u>), 2.55 (1 H, br d, J 13.9, 4 $\mu$ -<u>H</u>), 3.55 (1 H, br d, J 13.9, 4 $\mu$ -<u>H</u>), 3.55 (1 H, br d, J 13.9, 4 $\mu$ -<u>H</u>), 3.55 (1 H, br d, J 13.9, 4 $\mu$ -<u>H</u>), 3.55 (1 H, br d, J 13.9, 4 $\mu$ -<u>H</u>), 3.55 (1 H, br d, J 13.9, 4 $\mu$ -<u>H</u>), 3.55 (1 H, br d, J 13.9, 4 $\mu$ -<u>H</u>), 3.55 (1 H, br d, J 13.9, 4 $\mu$ -<u>H</u>), 3.55 (1 H, br d, J 13.9, 4 $\mu$ -<u>H</u>), 3.55 (1 H, br d, J 13.9, 4 $\mu$ -<u>H</u>), 3.55 (1 H, br d, J 13.9, 4 $\mu$ -<u>H</u>), 3.55 (1 H, br d, J 13.9, 4 $\mu$ -<u>H</u>), 3.55 (1 H, br d, J 13.9, 4 $\mu$ -<u>H</u>), 3.55 (1 H, br d, J 13.9, 4 $\mu$ -<u>H</u>), 3.55 (1 H, br d, J 13.9, 4 $\mu$ -<u>H</u>), 3.55 (1 H, br d, J 13.9, 4 $\mu$ -<u>H</u>), 3.55 (1 H, br d, J 13.9, 4 $\mu$ -<u>H</u>), 3.55 (1 H, br d, J 13.9, 4 $\mu$ -<u>H</u>), 3.55 (1 H, br d, J 13.9, 4 $\mu$ -<u>H</u>), 3.55 (1 H, br d, J 13.9, 4 $\mu$ -<u>H</u>), 3.55 (1 H, br d, dd,  $\underline{J}$  5.2 and 13.9,  $4\alpha - \underline{H}$ ), 2.81 (1 H, dd,  $\underline{J}$  2.0 and 8.4,22- $\underline{H}$ ), 2.90 (1 H, br d,  $\underline{J}$  11.9, 93- $\underline{H}$ ), 3.04-3.13 (2 H, m, 23-<u>H</u>, 24-<u>H</u>), 4.22 (1 H, m, 3-<u>H</u>), 4.54 (1 H, dd, <u>J</u> 4.3 and 9.0, 1-<u>H</u>), 4.95 and 4.99 (cach 1 H, m, 19-<u>H</u><sub>2</sub>), 5.83 (1 H, d, J 11.3, 7-H), and 6.46 (1 H, d, J 11.3, 6-H). The corresponding signals for the other isomers are as follows (only non-identical patterns and/or J values given):- 24: 0.05 and 0.06, 0.20 - 0.35, 0.53 (18-<u>H</u>3), 0.55, 0.85 and 0.89, 1.00 (d, <u>J</u> 6.6, 21-<u>H</u>3), 2.27, 2.57, 2.71-2.91 [4 H, including 2.74 (dd, <u>J</u> 1.9

and 7.4, 22- $\underline{H}$ }, 2.86 (90- $\underline{H}$ ), and 23- $\underline{H}$ , 24- $\underline{H}$ ], 4.21, 4.53, 4.94 and 4.97, 5.83 and 6.46. 25: 0.06 and 0.07, 0.28 - 0.46, 0.55 (18- $\underline{H}_3$ ), 0.58, 0.86 and 0.90, 1.02 (d,  $\underline{J}$  6.7, 21- $\underline{H}_3$ ), 2.29, 2.58, 2.84 - 2.94 (3 H, m), 3.14 (1 H, m), 4.22, 4.54, 4.95 and 4.99, 5.85, and 6.46. 26: 0.06 and 0.07, 0.25 - 0.45, 0.55, 0.58, 0.87 and 0.90, 1.13 (d,  $\underline{J}$  6.4, 21- $\underline{H}_3$ ), 2.32, 2.55,2.68 (22- $\underline{H}$ ), 2.84 - 2.94 (2 H, m, 9- $\beta\underline{H}$  and 23- $\underline{H}$ ), 3.02 (1 H, dd,  $\underline{J}$  2.3 and 4.4, 24- $\underline{H}$ ), 4.22, 4.54, 4.95 and 4.99, 5.83, and 6.46.

 $\frac{1(\underline{S}),3(\underline{R})-\underline{Bis}(\underline{tert}-\underline{butyldimethylsilyloxy})-20(\underline{R})-(3'(\underline{R})-\underline{cyclopropyl-3'-\underline{bydroxyprop-1'(\underline{E})}-\underline{eypl})-9,10-\underline{secopregna-5(\underline{Z}),7(\underline{E}), 10(\underline{19})-\underline{triene}(\underline{Z})}$ . A solution of the alcohol ( $\underline{2}$ ]) (1.00 g, 1.56 mmol), anthracene (170 mg), and triethylamine (1 drop) in toluene (75 ml) in a pyrex flask was irradiated with light from a high pressure ultraviolet lamp, type TQ 71822 (Hanau) at 20°C for 60 min. The solution was filtered, concentrated <u>in vacuo</u> and the residue purified by chromatography (15% ethyl acetate in petroleum ether as eluant) to give the (<u>52)-yitamin derivative</u> ( $\underline{27}$ ) as an oil/foam ( 886 mg, 89 %);  $\lambda_{max}$  264 nm;  $\delta$  0.06 (12 H, s), 0.15-0.65 (4 H, m), 0.55 (3 H, s), 0.88 (18 H, s), 1.05 (3 H, d, <u>J</u> 7), 3.5 (1 H, m), 4.2 (1 H, m), 4.35 (1 H, m), 4.85 (1 H, m), 5.17 (1 H, m), 5.06 (2 H, m), 5.99 (1 H, d, <u>J</u> 12) and 6.24 (1 H, d, <u>J</u> 12), <u>m/z</u> 640 ( $\underline{M}^+$ , 7), 625 (1), 623 (2), 583 (1), 508 (34), 493 (2), 490 (7), 451 (3), 383 (4), 379 (5), 355 (5), and 248 (100%).

 $\frac{1(\underline{S}), 3(\underline{R}) - Bis(\underline{tert} - butyldimethylsilyloxy) - 20(\underline{B}) - (3^{+}(\underline{S}) - cyclopropyl - 3^{+} - hydroxyprop - 1^{+}(\underline{E}) - enyl) - 9, 10 - secopregna -5(\underline{Z}), 7(\underline{E}), 10(19) - triene (28). The use of the alcohol (22) (1.13 g, 1.76 mmol) as starting material instead of$  $21 in the preceding preparation gave the (52) - vitamin derivative (28) as an oil/foam (1.04 g, 92 %); <math>\lambda_{max}$ 264 nm;  $\delta$  0.06 (12 H, s), 0.15-0.65 (4 H, m), 0.55 (3 H, s), 0.88 (18 H, s), 1.05 (3 H, d, J 7), 3.45 (1 H, m), 4.2 (1 H, m), 4.35 (1 H, m), 4.85 (1 H, m), 5.17 (1 H, m), 5.46 (2 H, m), 5.99 and 6.24 (each 1 H, d, J 12);  $\underline{m}/\underline{z}$  640,462 ( $\underline{M}^+$ , 7;  $C_{39}H_{68}O_3S_2$  requires 640.471), 248 (100%).

 $\frac{20(\underline{R})-(3^{*}(\underline{R})-Cyclopropyl-3^{*}-hydroxyprop-1^{*}(\underline{E})-enyl)-1(\underline{S}),3(\underline{R})-dihydroxy-9,10-secopregna-5(\underline{Z}),7(\underline{E}),10(19)-triene (\underline{29}).$  A solution of  $\underline{Z}$  (886 mg,1.38 mmol) and tetrabutylammonium fluoride (2.1 g, 6.7 mmol) in tetra-hydrofuran (40 ml) was heated at 60°C for 50 min. After cooling, the reaction solution was partitioned between EtOAc (150 ml) and 2% NaHCO<sub>3</sub> solution (100 ml), and the organic layer was washed with water and brine, dried and concentrated. The residue was purified by chromatography (silica gel, 50 g, EtOAc as eluant) to give the <u>vitamin D analogue</u> (<u>29</u>) (408 mg, 72 %) as needles, m.p. 143-145°C (from Et<sub>2</sub>O-hexanes) (Found: C, 78.22; H, 9.86. C<sub>27</sub>H<sub>4</sub>O<sub>3</sub> requires C, 78.60; H, 9.77%),  $\lambda_{max}$  264 nm (£17000);  $\delta$  0.15-0.65 (4 H, m), 0.56 (3 H, s), 0.75-1.1 (1 H, m), 1.05 (3 H, d, <u>J</u> 7 Hz), 3.47, (1 H, m), 4.2 (1 H, m), 4.4 (1 H, m), 4.99 (1 H, m), 5.31 (1 H, m), 5.50 (2 H, m), 5.99 and 6.36 (each 1 H, d, <u>J</u> 11); <u>m/z</u> 412 (<u>M</u><sup>4</sup>, 51, 394 (8), 379 (1), 376 (5), 287 (5), 285 (6), 283 (7), 269 (10), 267 (5), 265 (4), 251 (10), 152 (27) and 134 (100%).

 $\frac{20(\underline{R}) - (3' - (\underline{S}) - Cyclopropyl - 3' - hydroxyprop - 1'(\underline{E}) - enyl) - 1(\underline{S}), 3(\underline{R}) - dihydroxy - 9, 10 - secopregna - 5(\underline{Z}), 7(\underline{B}), 10(19) - triene (MC 903, \underline{4}).$  The use of 28 (1.03 q, 1.61 mmol) as starting material instead of 27 in the preceding preparation gave MC 903 (\underline{4}) (483 mg, 73 %), m.p. 166-168°C (from methyl formate) (Found: C, 78.30; H, 9.85.  $C_{27}H_{40}O_3$  requires C, 78.60; H, 9.77%;  $\lambda_{max}$  264 (£17200);  $\delta$  0.15-0.65 (4 H, m), 0.56 (3 H, s), 0.75-1.1 (1 H, m), 1.05 (3 H, d, \underline{J} 7 Hz), 3.45 (1 H, m), 4.2 (1 H, m), 4.4 (1 H, m), 4.99 (1 H, m), 5.31 (1 H, m), 5.47 (2 H, m), 5.99 (1 H, d, \underline{J} 11 Hz); and 6.36 (1 H, d, \underline{J} 11 Hz);  $\underline{m}/\underline{z}$  412 ( $\underline{M}^+$ , 6), 394 (8), 379 (2), 376 (5), 287 (5), 285 (7), 283 (8), 269 (11), 267 (6), 265 (4), 251 (12), 152 (26), and 134 (100%).

## ACKNOWLEDGEMENTS

I am grateful to Mr. E. Binderup for sharing a wealth of practical experience in the field of vitamin D chemistry with me. I thank Messrs. G. Cornali and W. Egger for the microanalyses, Mr. N. Rastrup Andersen and his associates for spectroscopic services, and Mrs. B. Tellefsen for typing the manuscipt. The mass spectra were kindly run by Dr. J. Øgaard Madsen at the Institute of Organic Chemistry, the Technical University of Denmark.

It should be noted that the relative polarities of the SO<sub>2</sub>-adducts of vitamin D<sub>3</sub> are given incorrectly in this paper.
- 14. In the absence of base, no 15 or 16 is isolated. (<u>Cf</u>. the discussion of corresponding reactions in the 1-desoxy series in ref. 10.)
- 15. The presence of detectable amounts of "unnatural" (20<u>R</u>) epimer already in the samples of 14a or 14b was excluded by comparison with the mixture of (20<u>R</u>) SO<sub>2</sub>-adducts prepared from an isolated sample of 16, the corresponding (20<u>R</u>) epimers being slightly more polar on TLC than 14a and 14b respectively and having characteristically different "H-NMR spectra. (In particular, the C-21 H<sub>3</sub> doublet is consistently shifted <u>ca</u>. 0.1 p.p.m. to high field in all the 20-"unnatural" compounds described in this paper relative to the corresponding 20-"natural" compounds.)
- 16. The use of the configurationally-pure aldehydes 14 directly for the elaboration of the side chain (cf. our seleno-acetal route<sup>11</sup>) was precluded in the present work because of their instability to the thermal Wittig reaction. However, low temperature reactions with nonstabilised ylides can be efficiently performed on these substrates (unpublished work).
- 17. In an alternative synthesis of 17, the la-hydroxyl group has been introduced and silylated after the incorporation of the new side chain <u>via</u> the sequence of ozonolysis of 7a or 7b, extrusion of SO<sub>2</sub>, and Wittig reaction. This route gives comparable yields and obviates the need to convert the triene to the SO<sub>2</sub>-adducts a second time, but in practise makes the synthesis less convenient for the generation of other target compounds: as indicated earlier, the primary objective was to couple a late key intermediate (15) with a variety of side chain fragments <u>en route</u> to target compounds having various side chain ring sizes. Thus, reaction with the corresponding cyclobutyl-containing phosphorane gave the cyclobutyl analogue of 17, m.p. 114-115 °C. Structure-activity relationships for a series of homologues and other compounds related to 4 will be discussed elsewhere.
- 18. O. Louis-Andre and G. Gelbard, Tetrahedron Lett., 1985, 26, 831.
- 19. Nor did the <sup>1</sup>H-NMR spectrum of 20 show any indication that a mixture of 24-epimers had been formed. However, the <sup>13</sup>C-NMR spectrum of 20 and its <u>0</u>-benzoyl derivative contained two signals (of approx. equa) height) for most of the side chain carbons, thus showing that 20 was a <u>ca</u>. 1:1 mixture (<u>cf</u>. N. Koizumi, Y. Fujimoto, T. Takeshita and N. Ikekawa, <u>Chem. Pharm. Bull</u>., 1979, 27, 38).
- J.-L. Luche, J. Org. Chem., 100, 2226. This reaction has also conveniently provided access to 21 and 22 bearing a <sup>3</sup>H label at C-24.
- 21. This novel use of Sharpless oxidation in the kinetic resolution mode (ref. 22) to assign configurations in each of two diastereoisomers cannot be claimed as providing absolute proof, though it is considered highly unlikely that the hydrocarbyl nature of the proximal additional chirality would invert the expected selectivities. It may be noted in this connection that the proportion of 22 in the mixture 21/22 was dramatically increased when the reduction of 17 was performed with the (S)-BINAL-H reagent (R. Noyori, I. Tomino, Y. Tanimoto and M. Nishizawa, J. Amer. Chem. Soc., 1984, 106, 6709), and this selectivity is also consistent with the assignment of the (24S) configuration in 22. Final proof of the structure of MC 903 (4) awaits the results of X-ray crystallographic studies.
- V.S. Martin, S.S. Woodard, Y. Yamada, M. Ikeda and K.B. Sharpless, <u>J. Amer. Chem. Soc</u>., 1981, 103, 6237.
- 23. The results were particularly striking for examples in which the substrate is either a terminal olefin or (as is the case for 21 and 22) an  $(\underline{E})$ -configurated olefin. The epoxidations (ref. 22) of (+)- or (-)-1-cyclohexyl-2( $\underline{E}$ )-buten-1-ol provide a model for the present work.
- 24. T. Katsuki and K.B. Sharpless, <u>J. Amer. Chem. Soc</u>., 1980, 102, 5974.
- 25. The NMR spectroscopic features of the epoxy-alcohols support these assignments by strongly suggesting that 23,26 and 24,25 have pairwise the same configuration of the epoxide group  $(\underline{cf. \delta_{H}} \text{ for } 21-\underline{H}_{3} \text{ and } \underline{\delta_{C}} \text{ for } \underline{C}-16, 17, 20 \text{ and } 21, recorded in the Experimental), while 23,25 and 24,26 present similar close environments for C-25 (i.e. anti or syn juxtaposition of C-23 and C-24) (cf. <math display="inline">\underline{\delta_{C}} \text{ for } \underline{C}-25$ ).
- 1,24(<u>B</u>)-(OH)<sub>2</sub>-D<sub>3</sub>(3) is known<sup>6</sup> to be more active than its 24-epimer and has the "natural" C-24 configuration presented in side chain dihydroxylated vitamin D metabolites containing a 24-OH.
