The UV illumination of title compounds 3a,b in acetonitrile solutions leads to corresponding five-membered ring isomers 4a,b, probably, *via* open-ring intermediates, whereas the photocolouration was observed in the solid state.

The photochromism has recently highlighted a considerable application potential for data storage technologies.¹ The increasing activity focused on the development and features of new compounds with photochromic properties1 prompted us to investigate possible consequences of the integration of selenium with a favourable photochromic system. 2,4,4,6-Tetraaryl-4H-thiopyrans 1 are known to exhibit UV photocolouration² followed by multi-step transformations to final 2,3,4,6-tetraaryl-2H-thiopyrans $2^{2(c),(d)}$ Contrary, the properties and photochemistry of analogous 2,4,4,6-tetraaryl-4H-selenopyrans 3 remain almost unknown.3 Hitherto reports are mostly intent on similar 2,4,6triphenyl-4H-selenopyrans.³ Of the considered 2,4,4,6-tetraphenyl derivatives, only parent 2,4,4,6-tetraphenyl-4H-selenopyran 3a, prepared by the reaction of a 2,4,6-triphenylselenopyrylium salt with phenylmagnesium bromide, and its reaction with bromine have been reported.⁴ Hence, here we report that the replacement of the sulfur 1-heteroatom by selenium dramatically changes the photoisomerization. Thus, acetonitrile solutions of 2,4,4,6-tetraphenyl-4*H*-selenopyran 3a or 2,6-bis(4-fluorophenyl)-4,4-diphenyl-4H-selenopyran 3b, prepared by the cyclocondensations of corresponding 1,5-diones (ArCOCH₂)₂CPh₂ with the H₂Se-HCl reagent, have been directly irradiated with a high-pressure 125 W mercury UV lamp in a quartz photoreactor at 12 °C for 1 h under argon[†] to afford approximately 2:3 equilibrium mixtures of (E)-3,3,5-triphenyl-2-(phenylmethylidene)-2,3-dihydroselenophene 4a or (\hat{E}) -5-(4-fluorophenyl)-2-[(4-fluorophenyl)methylidene]-3,3-diphenyl-2,3-dihydroselenophene 4b and starting 4Hselenopyran 3a or 3b. Prolonged UV exposures lead to irreversible degradation of photoisomers 3a,b and 4a,b to complex mixtures of unidentified compounds. In the solid state, a photocolouration was observed. A sample of the polycrystalline powder of 3a in MgO showed a green photocolouration after irradiation (300 s) with a high-pressure 200 W mercury discharge lamp.

The correct structures of **3a**,**b** of the starting 4H-selenopyrans follow from their ¹H and ¹³C NMR and EI mass spectra.[†] On the other hand, the molecular structures of their photoisomers could not be positively derived in the same way. Therefore, the

photoproduct from difluoro derivative **3b** was analysed by X-ray diffraction,[‡] which confirmed the structure of **4b** (Figure 1). Then, the analogous structure of **4a** can be assigned to the photoisomer of **3a** by comparison of the corresponding spectral data.[§]

The results indicate that the photochemically induced isomerization $3 \rightarrow 4$ in the 4*H*-selenopyran series surprisingly differs from the isomerization $1 \rightarrow 2$ in the 4*H*-thiopyran series and probably proceeds *via* a labile acetylenic intermediate like PhC=C-CPh₂-CH=C(SeH)Ph, which may undergo two parallel intramolecular ring-closures to either 2,3-dihydroselenophenes 4 or to 4*H*-selenopyrans 3.

For the sake of completeness, the UV–VIS absorption spectrum of an acetonitrile solution consists of a main maximum at 238 (log ε = 3.73 dm³ mol⁻¹ cm⁻¹) or 273 nm (log ε =

The photochemical reactions were monitored by HPLC with an UV detector (254 nm) on Separon SGX C18 (Tessek, Czech Republic), particle size of 5 µm, eluent MeOH. The photoisomer mixtures were separated by preparative TLC. NMR spectra were measured on a Varian VXR-400 or INOVA-400 (399.90 and 100.57 MHz for $^1\mathrm{H}$ and $^{13}\mathrm{C},$ respectively) instrument in CDCl₃ solutions at 25 to 30 °C. The assignments were based on COSY, HOM2DJ, HMQC, HMBC, 1D-TOCSY, and 1D-NOE experiments; the methine (exocyclic) carbon of compounds 4 is indicated with the number 6; *i- ipso, o- ortho, m- meta, p- para.* In fluorine-containing compounds, capital letters denote multiplicity due to protons, lowercase letters are used for fluorine-related multiplicity. Positive-ion mass spectra were recorded on a Finnigan MAT 95 doublefocusing instrument of BE geometry equipped with an EI ion source [ionization energy of 70 eV, source temperature of 250 °C, emission current of 0.5 mA, accelerating voltage of 5 kV, direct inlet (150-160 °C)]. For high resolution experiments, the instrument was tuned to a resolution of about 8000 (10% valley definition), and the measurements were carried out by the peak-matching method against the Ultramark 1600F (PCR Inc. Gainesville, USA) as an internal standard.

For **3a**: mp 138–140 °C (lit.,⁴ mp 138–139 °C). ¹H NMR (CDCl₃) δ : 6.453 (s, 2H, 3,5-H), 7.240 (m, 4H, *m*-2,6-Ph), 7.293–7.380 (m, 12H, aromatic), 7.560 (m, 4H, *o*-2,6-Ph). ¹³C NMR (CDCl₃) δ : 56.11 (s, 1C, 4-C), 126.37 (d, 2CH, *p*-4,4-Ph), 126.87 (d, 4CH, *o*-2,6-Ph), 127.49 (d, 2CH, 3,5-CH), 128.24 (d, 4CH, *m*-4,4-Ph), 128.36 (d, 4CH, *o*-4,4-Ph), 128.41 (d, 2CH, *p*-2,6-Ph), 128.61 (d, 4CH, *m*-2,6-Ph), 130.71 (s, 2C, *i*-2,6-Ph), 139.74 (s, 2C, *i*-4,4-Ph), 147.56 (s), 2C, 2,6-C). For **3b**: mp 113–115 °C. ¹H NMR (CDCl₃) δ : 6.368 (s, 2H, 3,5-H), 7.041 (m, 4H, *o*-2,6-C₆H₄F, 2×0.5 of AA'BB'X spectrum, $J_{\rm HF}$ 8.5 Hz, ΣJ 8.9 Hz), 7.242 (m, 2H, *p*-4,4-Ph), 7.285 (m, 4H, *o*-4,4-Ph), 7.338 (m, 4H, *m*-4,4-Ph), 7.506 (m, 4H, *m*-2,6-C₆H₄F, 2×0.5 of AA'BB'X spectrum, $J_{\rm HF}$ 5.3 Hz, ΣJ 8.9 Hz). ¹³C NMR (CDCl₃) δ : 56.17 (S, 1C, 4-C), 115.56 (Dd, 4CH, *m*-2,6-C₆H₄F, $J_{\rm CF}$ 21.7 Hz), 126.51 (D, 2CH, *p*-4,4-Ph), 127.68 (D, 2CH, 3,5-CH), 128.18 (D, 4CH, *m*-4,4-Ph), 128.44 (D, 4CH, *o*-4,4-Ph), 128.63 (Dd, 4CH, *o*-2,6-C₆H₄F, $J_{\rm CF}$ 8.2 Hz), 129.69 (S, 2C, *i*-4,4-Ph), 135.78 (Sd, 2C, *i*-2,6-C₆H₄F, $J_{\rm CF}$ 2.4 Hz). MS, *m*/*z* (%): 486.0692 (100, M⁺, C₂₉H₂₀F₂Se), 409 (78), 391 (5), 327 (27), 309 (25), 285 (22), 251 (7), 233 (15), 209 (13), 165 (17).

 $\begin{array}{l} \label{eq:Figure 1} & \mbox{Molecular structure of compound 4b. Selected bond lengths (Å):} \\ Se(1)-C(2) 1.920(3), Se(1)-C(5) 1.907(3), C(2)-C(6) 1.331(4), C(2)-C(3) \\ 1.531(3), C(3)-C(4) 1.519(3), C(4)-C(5) 1.329(4); selected bond angles (°): \\ C(2)-Se(1)-C(5) 87.43(9), Se(1)-C(2)-C(3) 110.8(2), C(2)-C(3)-C(4) \\ 105.7(2), C(3)-C(4)-C(5) 120.2(2), Se(1)-C(5)-C(4) 112.1(2), Se(1)-C(2)-C(6) 119.2(2); selected torsion angles (°): C(2)-Se(1)-C(5)-C(4) \\ 7.8(2), C(5)-Se(1)-C(2)-C(3) -16.4(2), Se(1)-C(2)-C(3)-C(4) 20.1(2), \\ Se(1)-C(2)-C(6)-C(7)-179.9(2). \end{array}$

= $3.79 \text{ dm}^3 \text{ mol}^{-1} \text{ cm}^{-1}$) and a shoulder at about 287 or 283 nm for compound **3a** or **3b**, respectively. A similarity between the UV–VIS spectra of selenopyrans and appropriate derivatives of thiopyrans^{2(c)} is evident, and it can be attributed to identical quantal transitions.

To our knowledge, the described conversion $3 \rightarrow 4$ is a unique example of photochemical ring conversion among six-membered selenium heterocycles⁵ and, contrary to other 2,4,4,6-tetraaryl-4*H*-(hetero)pyrans,² no photochemical di- π -methane rearrangement of one of the 4,4-phenyl groups has been observed. The photochemistry of such di- π -selenide systems belongs to an

[‡] *Crystal data for* **4b**: C₂₉H₂₀F₂Se, *M* = 485.43, monoclinic, space group *P*2₁/*c*, *a* = 11.495(2) Å, *b* = 11.909(4) Å, *c* = 16.353(1) Å, *β* = 90.50(1)°, *V* = 2238.7 Å³, *Z* = 4, *d*_{calc} = 1.44 g cm⁻³, *F*(000) = 982.88, μ = 2.52 mm⁻¹. 8525 reflections measured with an Enraf Nonius CAD4 diffractometer (293 K, graphite-monochromated CuKα radiation, λ = 1.54184 Å, $\omega/2\theta$ scan mode, 2θ range of 5–134°). The structure was solved by direct methods and anisotropically refined by full-matrix least squares.⁹ Hydrogen atoms were located from a Δ -*ρ* map, positions and isotropical thermal motion were refined. The final agreement factors are *R* = 4.11% and *R*_w = 4.11%. Atomic coordinates, bond lengths, bond angles and thermal parameters have been deposited at the Cambridge Crystallographic Data Centre (CCDC). For details, see 'Notice to Authors', *Mendeleev Commun.*, Issue 1, 2001. Any request to the CCDC for data should quote the full literature citation and the reference number 1135/85.

⁸ For **4a**: mp 150–152 °C, preparative yield 11%. ¹H NMR (CDCl₃) δ: 6.588 (s, 1H, 6-H), 6.701 (s, 1H, 4-H), 7.218–7.368 (m, 14H, aromatic), 7.382 (m, 4H, *o*-3,3-Ph), 7.480 (m, 2H, *o*-5-Ph). ¹³C NMR (CDCl₃) δ: 74.73 (s, 1C, 3-C), 126.83 (d, 2CH, *o*-5-Ph), 126.92 (d, 2CH, *o*-6-Ph), 127.08 (d, CH, *p*-6-Ph), 127.89 (d, 2CH, *p*-3,3-Ph), 128.32 (d, 4CH, *m*-3,3-Ph), 128.45 (d, 2CH, *m*-5-Ph), 128.49 (d, 1CH, *p*-5-Ph), 128.53 (d, 4CH, *o*-3,3-Ph), 128.60 (d, 2CH, *m*-6-Ph), 129.85 (d, 1CH, 6-CH), 129.91 (d, 1CH, 4-CH), 135.11 (s, 1C, *i*-5-Ph), 136.22 (s, 1C, 5-C), 137.59 (s, 1C, *i*-6-Ph), 144.42 (s, 1C, 2-C), 145.26 (s, 2C, *i*-3,3-Ph).
