## ABSTRACT

The synthesis of a branched trisaccharide, the repeating unit of the antigen O2 polymer containing L-rhamnose, D-mannose, and L-xylose, was achieved using orthoester formation - rearrangement strategy.

## INTRODUCTION

Since its introduction by Ogawa's group in 1981,<sup>1a</sup> the use of TMSOTf catalyzed rearrangement for building glycosidic linkages has not received much attention, and very few examples<sup>1</sup> have been reported. We found that under suitable conditions, both orthoester formation and subsequent rearrangement are carried out readily forming a glycosidic linkage stereoselectively in high yields. Here we present the synthesis of a branched trisaccharide using orthoester formation - rearrangement strategy.

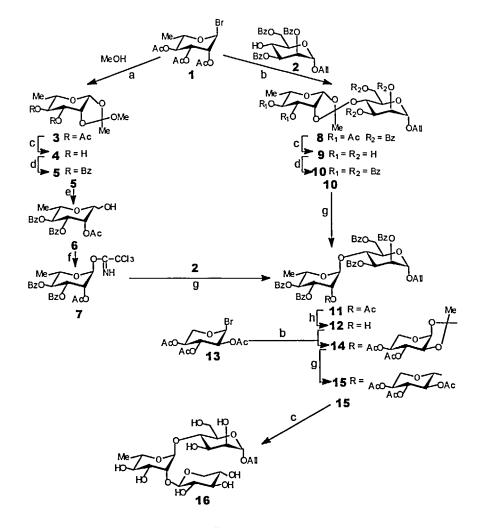

Scheme 1

#### **RESULTS AND DISCUSSION**

The organism known as *Stenotrophomonas (Xanthomonas* or *Pseudomonas)* maltophilia is an agent of nosocomial infection and a potential threat to the cystic fibrosis population. The antigen O2 polymer containing L-rhamnose, D-mannose, and L-xylose was isolated from the lipopolysaccharide (LPS) occurring in the reference strain for *Stenotrophomonas maltophilia* serogroup O2, and its structure was elucidated to be composed of a branched trisaccharide repeating unit,<sup>2</sup> as shown in Scheme 1.

The following reaction pathway was designated for the synthesis of the described trisaccharide. Selective benzoylation<sup>3</sup> of allyl  $\alpha$ -D-mannopyranoside, afforded allyl 2,3,6-tri-O-benzoyl- $\alpha$ -D-mannopyranoside 2. Coupling<sup>4</sup> of 2 with acetobromorhamnose in dichloromethane in the presence of equivalent AgOTf and 2,4-lutidine, gave orthoester 8 as the sole product in nearly quantitative yield. Deacetylation of 8 followed by benzoylation gave orthoester 10 in very high yield. Rearrangement<sup>4</sup> of 10 with a catalytic amount of TMSOTf gave the desired disaccharide 11 in satisfactory yield (86%). Selective deacetylation<sup>5</sup> of 11 with CH<sub>3</sub>COCl/MeOH readily furnished disaccharide 12 (96%), its coupling with acetobromo-L-xylose 13, prepared easily from L-xylose according to the method for acetobromination of glucose,<sup>6</sup> in the presence of equivalent AgOTf and 2,4-lutidine gave orthoester 14 as the sole product in very high yield (96%). Rearrangement of 14 with a catalytic amount of TMSOTf gave trisaccharide 15 (85%), and subsequent deprotection with catalytic MeONa in MeOH easily afforded the final trisaccharide 16 in quantitative yield.

a: MeOH/lutidine/t-Bu<sub>4</sub>NBr (92%); b: AgOTf/lutidine (>95%); c: MeONa/MeOH (quant); d: BzCl/pyridine (quant); e: 70%AcOH (90%); f: CCl<sub>3</sub>CN/DBU (83%); g: TMSOTf/CH<sub>2</sub>Cl<sub>2</sub>(>80%); h: CH<sub>3</sub>COCl/MeOH (96%);

To confirm the structure of 11, an alternative synthesis was conducted. Thus methyl orthoester 3 was prepared in a high yield from reaction of acetobromorhamnose with MeOH in the presence of lutidine/t-Bu<sub>4</sub>NBr. Deacetylation of 3 followed by benzoylation gave orthoester 5 in nearly quantitative yield. Hydrolysis of 5 in 70% AcOH solution afforded 2-O-acetyl-3,4-di-O-benzoyl- $\alpha$ , $\beta$ -L-rhamnopyranose 6 with C-1 hydroxyl free,

which was converted to the trichloroacetimidate glycosyl donor 7 on treatment with  $CCl_3CN/DBU$  (overall yield 74%, for two steps). Glycosylation<sup>7</sup> of the acceptor 2 with the trichloroacetimidate 7 promoted by TMSOTf gave disacchride (85%) identical to 11.

The key intermediates involved in the synthesis were characterized by <sup>1</sup>H NMR spectroscopy, optical rotation, and elemental analysis, the deprotected trisaccharide **16** gave <sup>1</sup>H NMR data similar to those reported in the literature.<sup>2</sup>

In summary, we have presented an orthoester formation - rearrangement strategy that can be a useful and general method for building glycosidic linkages. Its advantages include the high stereoselectivity and yield, the use of easily prepared acetobromoglycose as the starting material, the use of sole acyl protective groups which are easily removed by base, and the potential for building the  $1\rightarrow 2$  glycosyl linkage.

#### EXPERIMENTAL

General methods. Melting points were determined with a 'Mel-Temp' apparatus. Optical rotations were determined with a Perkin-Elmer model 241-MC automatic polarimeter for solutions in a 1-dm, jacketed cell. <sup>1</sup>H NMR spectra were recorded with Varian XL-400 and XL-200 spectrometers, for solutions in CDCl<sub>3</sub> with tetramethylsilane (Me<sub>4</sub>Si) as the internal standard. Chemical shifts are expressed in ppm downfield from the internal Me<sub>4</sub>Si absorption. Mass spectra were recorded with a VG PLATFORM mass spectrometer using the ESI technique to introduce the sample. Thin-layer chromatography (TLC) was performed on silica gel HF, detection being effected by charring with 30% (v/v) sulfuric acid in methanol or sometimes by UV detection. Column chromatography was conducted by elution of a column (8/100 mm,  $\cdot$ 16/240 mm, 18/300 mm, and 35/400 mm) of silica gel (100-200 mesh) with EtOAc/petroleum ether (bp 60-90 °C) as the eluent. Solutions were concentrated at a temperature < 60 °C under diminished pressure.

Allyl 2,3,6-Tri-O-benzoyl- $\alpha$ -D-mannopyranoside (2). Freshly distilled benzoyl chloride (11 mL, 92 mmol) was added dropwise to a solution of allyl  $\alpha$ -D-mannopyranoside (5.0 g, 23 mmol) in dry pyridine (200 mL) at 0 °C. The mixture was allowed to warm up to room temperature and stirred overnight. The reaction was

quenched with MeOH (10 mL), the mixture was concentrated, and the residual solution was poured into ice-water, extracted with CH<sub>2</sub>Cl<sub>2</sub> (80 mL) and washed sequentially with N HCl (50 mL), satd aq NaHCO<sub>3</sub> (50 mL), and aq NaCl (50 mL). The aqueous phases were re-extracted with CH<sub>2</sub>Cl<sub>2</sub> (40 mL), and the combined organic solutions were dried, concentrated, and the resultant residue was purified by column chromatography with 1/1 petroleum ether/EtOAc as the eluent to give compound 2 as a colorless syrup (9.2 g, 76%):  $[\alpha]_D^{20}$  +1.85° (*c* 1.6, CHCl<sub>3</sub>); <sup>1</sup>H NMR (CDCl<sub>3</sub>)  $\delta$  8.20-7.90 (m, 6H, Bz-H), 7.70-7.23 (m, 9H, Bz-H), 6.08-5.84 (m, 1H, CH<sub>2</sub>=CH-CH<sub>2</sub>-), 5.65 (dd, 1H, J<sub>2,3</sub> = 2.6 Hz, J<sub>3,4</sub> = 9.3 Hz, H-3), 5.63 (dd, 1H, J<sub>1,2</sub> = 1.0 Hz, J<sub>2,3</sub> = 2.6 Hz, H-2), 5.41-5.20 (m, 2H, CH<sub>2</sub>=CH-CH<sub>2</sub>-), 5.07 (d, 1H, J<sub>1,2</sub> = 1.0 Hz, H-1), 4.89 (dd, 1H, J<sub>5,6</sub> = 4.0 Hz, J<sub>6,6</sub> = 12.6 Hz, H-6), 4.66 (dd, 1H, J<sub>5,6</sub> = 2.1 Hz, J<sub>6,6</sub> = 12.6 Hz, H-6<sup>3</sup>), 4.30 (t, 1H, J = 9.3 Hz, H-4), 4.38-4.15 (m, 3H, H-5, CH<sub>2</sub>=CH-CH<sub>2</sub>-).

4-O-(2-O-Acetyl-3,4-di-O-benzoyl-α-L-rhamnopyranosyl)-2,3,6-tri-O-Allyl benzoyl- $\alpha$ -D-mannopyranoside (11). Method A: To a stirred solution of sugar-sugar orthoester 10 (360 mg, 0.39 mmol) in dichloromethane (10 mL) under nitrogen atmosphere was added TMSOTf (7 µL, 0.1 equiv) at -20 °C, and the reaction was monitored by TLC (2:1 petroleum ether/EtOAc). After completion of the reaction, triethylamine (10 µL) was added, then the solid was filtered off and washed with CH<sub>2</sub>Cl<sub>2</sub>  $(3 \times 10 \text{ mL})$ . The combined filtrate and washings were washed sequentially with H<sub>2</sub>O (20 mL), N HCl (20 mL), satd aq NaHCO<sub>3</sub> (20 mL), and satd aq NaCl (20 mL). The aqueous washings were re-extracted with CH<sub>2</sub>Cl<sub>2</sub> (10 mL), the combined organic solutions were dried and concentrated, and the residue was subjected to flash chromatography with 2/1 petoleum ether/EtOAc as the eluent to give 11 (316 mg, 0.34 mmol) in a high yield (86%); Method B: Compound 6 (596 mg, 1.44 mmol) was treated with trichloroacetonitrile (Cl<sub>3</sub>CCN, 3 equiv) and 1,8-diazabicyclo[5,4,0]undec-7-ene (DBU, 0.25 equiv) at 0 °C in anhyd CH<sub>2</sub>Cl<sub>2</sub> for 1 h, at which time TLC (2/1 petroleum ether/EtOAc) indicated completion of the trichloroacetimidation reaction. Concentration of the reaction mixture followed by purification with flash chromatography (1.5/1 petoleum ether/EtOAc) gave the glycoside donor, trichloroacetimidate 7 (666 mg, 83%), which was used directly in the glycosylation reaction. A mixture of the donor 7 (660 mg, 1.18 mmol) and the acceptor 2 (535 mg, 1.0 mmol) in anhyd CH<sub>2</sub>Cl<sub>2</sub> (20 mL) containing 4 Å activated molecular sieves (0.5 g) was stirred under  $N_2$  for 1 h at room temperature and then cooled to -40 °C. Trimethylsilyl triflate (TMSOTf, 43 µL, 0.2 equiv) was added, the mixture was stirred under N<sub>2</sub> below -30 °C for 40 min., then TLC showed the starting material disappeared. Triethylamine (30 µL) was added to the reaction solution and the solid was filtered off and washed with CH<sub>2</sub>Cl<sub>2</sub> (30 mL). The combined filtrate and washings were handled as described in method A and the organic solution was dried and concentrated, and the

residue was subjected to flash chromatography with 2/1 petoleum ether/EtOAc as the eluent to give 11 (789 mg, 85%):  $[\alpha]_D^{20}$  -40.4° (*c* 0.6, CHCl<sub>3</sub>); <sup>1</sup>H NMR (CDCl<sub>3</sub>, 200 MHz)  $\delta$  8.20-7.80 (m, 10H, Bz-H), 7.67-7.24 (m, 15H, Bz-H), 6.10-5.90 (m, 1H, CH<sub>2</sub>=CH-CH<sub>2</sub>-), 5.91 (dd, 1H, J<sub>2,3</sub> = 3.4 Hz, J<sub>3,4</sub> = 9.5 Hz, H-3), 5.65 (dd, 1H, J<sub>1,2</sub> = 1.5 Hz, J<sub>2,3</sub> = 3.4 Hz, H-2), 5.60 (dd, 1H, J<sub>2',3'</sub> = 3.2 Hz, J<sub>3',4'</sub> = 9.8 Hz, H-3'), 5.41 (dd, 1H, J<sub>1',2'</sub> = 1.7 Hz, J<sub>2',3'</sub> = 3.2 Hz, H-2'), 5.45-5.25 (m, 3H, H-4', CH<sub>2</sub>=CH-CH<sub>2</sub>-), 5.11 (d, 1H, J<sub>1,2</sub> = 1.5 Hz, H-1), 5.05 (d, 1H, J<sub>1',2'</sub> = 1.7 Hz, H-1'), 5.00 (dd, 1H, J<sub>5,64</sub> = 1.7 Hz, J<sub>64,6b</sub> = 12.7 Hz, H-6<sub>a</sub>), 4.67 (dd, 1H, J<sub>5,6b</sub> = 3.4 Hz, J<sub>64,6b</sub> = 12.7 Hz, H-6<sub>b</sub>), 4.57 (t, 1H, J<sub>3,4</sub> = J<sub>4,5</sub> = 9.5 Hz, H-4), 4.40-3.94 (m, 4H, H-5, 5', CH<sub>2</sub>=CH-CH<sub>2</sub>-), 2.03 (s, 3H, CH<sub>3</sub>CO), 0.74 (d, 3H, J<sub>5',6'</sub> = 6.5 Hz, H-6').
