(11.X.96)

The photochemical synthesis of indole derivatives starting from the indoline-2-thiones **1** is described. Irradiation of indoline-2-thiones **1** in the presence of alkenes **3** gave 2-alkyl-3*H*-indoles **4**–**7** or 2-alkylindoles **8**–**22** through the ring cleavage of the intermediates, spirocyclic amino-thietanes, initially derived by [2 + 2] cycloaddition of the C=S bond of **1** and the C=C bond of **3**. Irradiation of **1** in the presence of trialkylamines **26** gave desulfurization products **27**–**32** and unexpected 3-alkylindoles **33**–**40**. *N*-Acylindoline-2-thiones **1i**–**p** yielded the deacylated products, indoline-2-thiones **1a**–**b**, and ethyl esters **43** through γ-H abstraction by the excited thioamide S-atom when irradiated in $CDCl_3$/EtOH or benzene/EtOH. Oxygen analogues **2a**–**d** also underwent intramolecular H abstraction to give the indolin-2-ones **2e**–**f** and ethyl esters **43** in a similar way.

1. Introduction. – In recent years, there has been great interest in the photochemistry of thioamide compounds from both synthetic and mechanistic view points [1]. In particular, they undergo [2 + 2] photocycloadditions with alkenes to yield amino-thietanes as primary products, which are usually unstable and are transformed into fragmentation products (*Scheme 1*). This may be ascribed to the participation of the lone-pair electrons on the N-atom, which facilitate the C–S bond cleavage of the thietane ring leading to zwitterions, and then they undergo further reactions [1c–d]. In the course of our studies of the photochemical reactions of cyclic conjugated nitrogen-thiocarbonyl systems [2], we found that photochemically induced addition of thioamides to alkenes provided a convenient method for the C–C bond formation of N-containing heterocycles [2a–d, g, j–k, m]. We recently reported that photodesulfurization reactions of indoline-2-thiones and 3,3-disubstituted indoline-2-thiones to indoles [2e] and indolines [2f], respectively, and [2 + 2] photocycloaddition reaction of 3,3-disubstituted indoline-2-thiones with electron-poor alkenes leading to 2-alkylideneindolines [2g]. *Das* and coworkers have shown that indoline-2-thiones undergo photoinduced addition to electron-poor alkene, methyl methacrylate, to give a mixture of isomeric 2-substituted indoles [3]. To see the scope and limitation of the photoaddition of indoline-2-thiones **1** and alkenes, we examined the photoreactions of **1** with a variety of alkenes **3** including electron-rich ones and related photoreactions of **1** (*Table 1*).

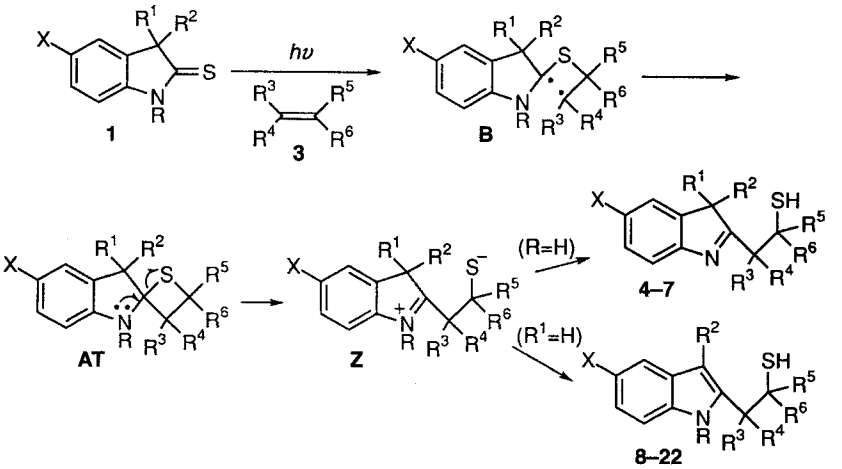
2. Results and Discussion. – 2.1. *Photoaddition of the Indoline-2-thiones* **1a–d, g–m, o–p** *and Alkenes* **3**. When a benzene solution of the 3,3-disubstituted indoline-2-thiones **1a–b** was irradiated with a high-pressure Hg lamp through a *Pyrex* filter under Ar, the unchanged starting materials were recovered quantitatively (*Scheme 2*). However, the 2-(mercaptoalkyl)-3*H*-indoles **4–7** were produced as one isomer, when indoline-2-thiones **1a–b** were irradiated in benzene in the presence of a large excess of the electron-poor alkenes such as methacrylonitrile **3a** and methyl methacrylate **3b**. The structures of these photoproducts were elucidated on the basis of their spectroscopic properties (IR: 2550–2580 cm^{-1} (SH), ^{1}H-NMR: *ABX* pattern for CH_2SH) and microanalyses, the latter indicating that they were 1:1 adducts of indoline-2-thiones **1** and alkenes **3**. Treatment of the 2-(mercaptoalkyl)-3*H*-indole **7** with MeI yielded the methylthio-ester **25** in 65% yield. 2-(Mercaptoalkyl)-3*H*-indoles **4–5** was heated at a higher temperature than their boiling points to yield 2-alkylideneindoles **23–24** with a loss of thioformaldehyde. Irradiation of the indoline-2-thione **1a** in the presence of electron-rich alkenes such as 2-methylprop-2-ene (**3d**), 2,3-dimethylbut-2-ene (**3e**), and ethyl vinyl ether (**3f**) under the same conditions resulted in recovery of the unchanged thione **1a**. In contrast, the indoline-2-thiones **1c–d, g–k**, which have at least one H-atom at C(3), undergo [2 + 2] photocycloaddition with both electron-poor and electron-rich alkenes to give 2-(mercapto)alkylindoles **8–22** in moderate-to-good yields. In the cases of 1-phenylindoline-2-thione (**1h**) and electron-poor trisubstituted alkene **3c** and electron-rich alkenes **3d–f**, 5-methyl-1-(*p*-tolyl)indoline-2-thione (**1i**) and electron-poor alkene **3b**, and 3-ethyl-1-phenylindoline-2-thione (**1k**) and **3b**, the desulfurization products, indoles **31–32** and **37**, were obtained as by-products. The formation of the desulfurization products **31–32** and **37** was already observed in the photolysis of the corresponding indoline-2-thiones in benzene [2e]. The photoaddition reaction of 1-phenylindoline-2-thione **1h** and methacrylonitrile **3a** was quenched by the addition of a triplet quencher such as 2,5-dimethylhexa-2,4-diene and cyclooctatetraene, and it proceeded by the addition of triplet sensitizer xanthone when irradiated at 366 nm light, and also proceeded when irradiated in the n-π^* region with a halogen lamp ($\lambda > 400$ nm). These facts suggested that the photocycloaddition proceeded *via* the excited n-π^* triplet state of **1h**. A reasonable mechanism for the formation of 2-(mercaptoalkyl)-3*H*-indoles **4–7** and 2-(mercaptoalkyl)indoles **8–22** can be best explained by the intermediacy of a spirocyclic amino-thietane **AT**, which was formed by regioselective [2 + 2] photocycloaddition of the C=S bond of indoline-2-thiones **1** and the C=C bond of alkenes **3** through the more stable biradical intermediate **B** [1c, d] [2]. Subsequent heterolytic cleavage of the C–S bond of the amino-thietane **AT** due to the participation of the lone-pair electrons on the N-atom afforded the zwitterion **Z**. 1,5-H Transfer from the N- to the S-atom gave 2-(mercaptoalkyl)-3*H*-indoles **4–7**, while H transfer from C(3) to the S-atom gave 2-alkylindoles **8–22** (*Scheme 3*).

Irradiation of 1-acylindoline-2-thiones **1l–m** and **1o** in the presence of methacrylonitrile **3a** also gave the 2-(mercaptoalkyl)-3*H*-indole **4**, which is the same product derived from **1a** and **3a**. 1-Acylindoline-2-thione **1p** was inert to the photoaddition with **3a**. The formation of **4** is considered to arise by photocycloaddition of **1a**, which is formed by γ-H abstraction by the excited thioamide S-atom of 1-acylindoline-2-thiones **1l–m** and **o**, to **3a** (see *Sect. 2.3*).

Scheme 3



2.2. *Photochemical Reactions of the Indoline-2-thiones* **1c–f** *and* **h–j** *in the Presence of Trialkylamines* **26.** We recently reported that irradiation of 3,3-disubstituted indoline-2-thiones in the presence of Et_3N affords the desulfurization products, indolines, *via* a sequential electron/proton-transfer mechanism [2f]. We now carried out the photolysis of the indoline-2-thiones **1c–f** and **h–j**, which have no substituents at C(3), in the presence of trialkylamine **26** and observed the formation of unexpected products, 3-alkylindoles **33–40**, along with desulfurization products, indoles **27–32** (*Scheme 4* and *Table 2*). Irradiation of indoline-2-thiones **1c–f**, **1h**, and **1i** in benzene in the presence of an excess of Et_3N (**26a**) under the similar conditions as described above gave the desulfurization products, indoles **27–32**, and unexpected products, 3-ethylindoles **33–37** and **40** in 11–41 and 23–61% yields, respectively. The structure of these photoproducts was confirmed by direct comparison of their IR and NMR spectra with those of authentic materials [2e] or on the basis of their spectral and analytical data. Both products, indole **31** and 3-alkylindoles **38** and **39** were obtained, when the indoline-2-thione **1h** was irradiated in the presence of trialkylamines such as Pr_3N (**26b**) and Bu_3N (**26c**) but in low yields, while the sole product, indole **31**, was obtained when **1h** was irradiated in the presence of amines such as Me_3N (**26d**), $(PhCH_2)_3N$ (**26e**), *N*,*N*-dimethylaniline, and Et_2NH. However, irradiation of 3-substituted indoline-2-thiones, 1-phenyl-3-methylindoline-2-thione **1j**, in the presence of Et_3N (**26a**) gave the corresponding indole **41** (61%) and the disulfide **42** (trace). This result is similar to that obtained in the photolysis of **1j** alone in benzene [2e]. 3-Ethylindole (**37**) was not produced, when 1-phenylindole (**31**) was irradiated in the presence of Et_3N (**26a**) in benzene. The mechanism for the formation of 3-alkylindoles **33–40** is not clear at present, but we tentatively postulate that the formation of **33–40** involves intermediates, anion radicals, resulting from electron transfer from the amine to the excited indoline-2-thiones **1**, analogous to the photodesulfurization of indoline-2-thiones **1** with amines [1f].

2.3. *γ-H Abstraction Reaction of 1-Acylindoline-2-thiones* **1l–p** *and Their Oxo Analogues* **2a–d.** As described briefly in *Sect. 2.1*, irradiation of 1-acylindoline-2-thiones

[a]) Isolated yield. [b]) Not detected.

1l–**o** in the presence of alkene **3a** gave the unexpected product, 2-(mercaptoalkyl)-3*H*-indolenine **4**, suggesting that γ-H abstraction by the excited thioamide S-atom would be involved in this reaction yielding deacylation product, indoline-2-thione **1a**. We carried out the photoreaction of 1-acylindoline-2-thiones **1l**–**p** and their oxo analogues **2a**–**d**. Irradiation of **1l**–**p** in $CDCl_3$ containing a small amount of EtOH in a NMR tube or benzene/EtOH (preparative scale) gave the parent indoline-2-thione **1a** and the corresponding ethyl esters **43a**–**d** with an efficiency depending on the nature of the substituents at C(1) (*Scheme 5* and *Table 3*). Similar deacylation was observed in the photolysis of 1-acylindolin-2-ones **2a**–**d**. The formation of esters **43a**–**d** can be explained in terms of the pathway involving γ-H abstraction by the excited thioamide S-atom or amide O-atom: removal of a H-atom from the C-atom α to the acyl function by the S-atom of the thiones **1l**–**p** or the O-atom of amides **2** leads to a diradical, which subsequently collapse to ketenes **44** and indoline-2-thiones **1a**–**b**, or indolin-2-ones

[a]) Photolysis was carried out in benzene/EtOH.

2e–f. Ketenes **44** thus produced reacted with EtOH to yield ethyl esters **43a–d**. Analogous γ-H abstractions were observed by *Barton* and *White* in the photolysis of *N*-acyl-2-thionothiazolidines [4].

Experimental Part

General. Chromatography: silica gel *Merck 60* and *Wakogel C-300* for flash chromatography (FC). M.p. and b.p.: uncorrected. IR Spectra: *Hitachi-260-30* or *Jasco FT/IR-300* photospectrometers, in cm^{-1}. ^1H- and ^{13}C-NMR Spectra: *Jeol FX-100* (100 MHz) or *Jeol JNM-EX-270* (270 MHz) spectrometers; in $CDCl_3$ using Me_4Si as an internal standard; δ in ppm, J in Hz.

Photoaddition of Indoline-2-thiones 1 and Alkenes 3. General Procedure. A soln. of **1** (1 mmol) in benzene (70 ml) in the presence of an excess of alkene **3** (*ca.* 1 ml) in a *Pyrex* vessel under Ar was irradiated with a high-pressure Hg lamp (*Halos EHP 500 W, Eikosha*) for 10–20 h at r.t. After removal of the solvent, the residue was chromatographed (silica gel, benzene/hexane 1:4 to 4:1) to yield products **4–22**, **31–32**, and **37** (*Table 1*). The structures of **31–32** and **37** were confirmed by comparison of their spectral data with those of previously described samples [2e].

*2-(3,3-Dimethyl-3*H*-indol-2-yl)-3-mercapto-2-methylpropanenitrile* (**4**). B.p. 150°/1 Torr (dec.). IR (film): 2550, 2230, 1545, 770, 755, 710. ^{1}H-NMR: 1.59 (*s*, 3H); 1.62 (*s*, 3H); 1.80 (*s*, 3H); 1.83 (*t*, *J* = 9.2, 1H); 3.03 (*A* of *ABX*, *J* = 9.2, 13.9, 1H); 3.47 (*B* of *ABX*, *J* = 9.2, 13.9, 1H); 7.28–7.36 (*m*, 3H); 7.45–7.58 (*m*, 1H). ^{13}C-NMR: 22.1(*q*); 22.7(*q*); 27.7(*q*); 34.8(*t*); 43.8(*s*); 55.1(*s*); 120.8(*d*); 121.0(*d*); 121.1(*s*); 126.6(*d*); 127.7(*d*); 146.0(*s*); 151.4(*s*); 183.4(*s*). This product decomposed when heated at higher temperature than b.p. yielding *2-(2,3-dihydro-3,3-dimethyl-1*H*-indol-2-ylidene)propanenitrile* (**23**). M.p. 204–205°. IR (KBr): 3270, 2190, 1615, 1470, 1455, 1225, 1205, 745. ^{1}H-NMR: 1.63 (*s*, 6H); 1.87 (*s*, 3H); 6.70–6.95 (*m*, 2H); 7.10–7.16 (*m*, 2H). ^{13}C-NMR: 14.6(*q*); 26.0(*q*); 46.8(*s*); 68.3(*s*); 108.4(*d*); 121.3(*d*); 122.2(*d*); 122.7(*s*); 127.8(*d*); 137.9(*s*); 141.8(*s*); 166.8(*s*). Anal. calc. for $C_{13}H_{14}N_2$ (198.26): C 78.75, H 7.12, N 14.13; found: C 78.93, H 7.04, N 13.82.

*Methyl 2-(3,3-Dimethyl-3*H*-indol-2-yl)-3-mercapto-2-methylpropanecarboxylate* (**5**). B.p. 180°/2 Torr (dec.). IR (film): 2550, 1725, 1640, 1545, 1370, 1355, 1285, 1230, 1200, 775, 755. ^{1}H-NMR: 1.35 (*s*, 3H); 1.43 (*s*, 3H); 1.55 (*dd*, *J* = 7.8, 16.5, 1H); 1.73 (*s*, 3H); 3.29–3.37 (*m*, 2H); 3.72 (*s*, 3H); 7.19–7.35 (*m*, 3H); 7.59 (*d*, *J* = 7.6, 1H). ^{13}C-NMR: 20.7(*q*); 23.6(*q*); 24.6(*q*); 33.3(*t*); 52.3(*q*); 53.8(*s*); 55.4(*s*); 120.7(*d*); 120.8(*d*); 126.2(*d*); 127.6(*d*); 146.7(*s*); 151.6(*s*); 172.9(*s*); 186.8(*s*). This product decomposed by distillation to yield *methyl-2-(2,3-dihydro-3,3-dimethyl-1*H*-indol-2-ylidene)propanecarboxylate* (**24**). B.p. 170°/2 Torr. IR (film): 3320, 1655, 1590, 1480, 1280, 1250, 1235, 1195, 1160, 780, 740. ^{1}H-NMR: 1.57 (*s*, 6H); 2.02 (*s*, 3H); 3.74 (*s*, 3H); 6.71–6.75 (*m*, 1H); 6.86–6.90 (*m*, 1H); 7.08–7.14 (*m*, 2H); 10.46 (*br s*, 1H). ^{13}C-NMR: 11.7(*q*); 25.4(*q*); 47.8(*s*); 51.0(*q*); 89.3(*s*); 108.3(*d*); 120.4(*d*); 121.6(*d*); 127.7(*d*); 138.4(*s*); 142,5(*s*); 166.4(*s*); 171.6(*s*). Anal. calc. for $C_{14}H_{17}NO_2$ (231.28): C 72.70, H 7.41, N 6.06; found: C 72.59, H 7.24, N 5.79.

*2-(3,3-diphenyl-3*H*-indol-2-yl)-3-mercapto-2-methylpropanenitrile* (**6**). M.p. 117–118°. IR (KBr): 2570, 2230, 1595, 1550, 1485, 1445, 755, 700. ^{1}H-NMR: 1.32 (*s*, 3H); 1.90 (*dd*, *J* = 8.9, 9.9, 1H); 2.78 (*dd*, *J* = 9.9, 13.9, 1H); 3.01 (*dd*, *J* = 8.9, 13.9, 1H); 7.01–7.23 (*m*, 2H); 7.28–7.44 (*m*, 11H); 7.67 (*d*, *J* = 7.9, 1H). ^{13}C-NMR: 26.4(*q*); 35.1(*t*); 44.0(*s*); 73.4(*s*); 120.2(*s*); 121.3(*d*); 123.8(*d*); 127.7(*d*); 128.2(*d*); 128.8(*d*); 128.9(*d*); 138.4(*s*); 146.8(*s*); 152.1(*s*); 182.4(*s*). Anal. calc. for $C_{24}H_{20}N_2S$ (368.42): C 78.22, H 5.47, N 7.60; found: C 78.09, H 5.60, N 7.61.

*Methyl 2-(3,3-Diphenyl-3*H*-indol-2-yl)-3-mercapto-2-methylpropanecarboxylate* (**7**). M.p. 101–102°. IR ($CHCl_3$): 2580, 1730, 1585, 1545, 1455, 1280, 1230, 1200, 750. ^{1}H-NMR: 1.43 (*s*, 3H); 1.68 (*t*, *J* = 8.9, 1H); 2.98–3.05 (*m*, 2H); 3.31 (*s*, 3H); 6.93 (*d*, *J* = 7.4, 1H); 7.08–7.15 (*m*, 1H); 7.22–7.38 (*m*, 11H); 7.70 (*d*, *J* = 7.6, 1H). ^{13}C-NMR: 20.6(*q*); 33.7(*t*); 52.2(*q*); 54.7(*s*); 73.2(*s*); 121.3(*d*); 123.4(*d*); 127.1(*d*); 127.5(*d*); 127.6(*d*); 127.7(*d*); 128.1(*d*); 128.4(*d*); 128.9(*d*); 129.2(*d*); 137.7(*s*); 139.0(*s*); 148.1(*s*); 152.2(*s*); 172.2(*s*); 184.6(*s*). Anal. calc. for $C_{25}H_{23}NO_2S$ (401.44): C 74.78, H 5.77, N 3.49; found: C 74.79, H 6.05, N 3.32.

A soln. of **7** (0.5 mmol) and MeI (3 mmol) in acetone (30 ml) in the presence of K_2CO_3 (2 mmol) was stirred for 5 h under Ar at r.t. A usual workup gave the sulfide **25** (65%).

*Methyl 2-(3,3-Diphenyl-3*H*-indol-2-yl)-2-methyl-3-(methylthio)propanecarboxylate* (**25**). M.p. 101–102°. Photochemical Reactions of Indoline-2-thiones **1** *in the Presence of Amines* **26.** *General Procedure.* A soln. of **1** (1 mmol) in benzene (70 ml) in the presence of an excess of **26** (*ca.* 1 ml) was irradiated under the same conditions as described above for 5 h. After purification by FC, indole derivatives **27**–**40** were obtained. (*Table 2*). The structures of **27**–**32** and **37** were confirmed by direct comparison of their spectral data with those of commercially available or previously described samples [2e].

*3-Ethyl-1*H*-indole* (**33**). B.p. 120°/2 Torr ([5]: 144–5°/13–4 Torr). IR ($CHCl_3$): 3480, 1615, 1485, 1455, 1415, 1340, 1235, 1090, 1035, 1010, 755. ^{1}H-NMR: 1.32 (*t*, *J* = 7.6, 3 H); 2.76 (*q*, *J* = 7.6, 2 H); 6.89 (*t*, *J* = 1.0, 1 H); 7.07–7.41 (*m*, 3 H); 7.60 (*d*, *J* = 7.6, 1 H); 7.70 (br. *s*, 1 H). ^{13}C-NMR: 14.4(*q*); 18.3(*t*); 111.0(*d*); 118.7(*s*); 119.0(*d*); 120.4(*d*); 121.8(*d*); 127.3(*s*); 128.3(*d*); 136.3(*s*).

*1-Benzyl-3-ethyl-1*H*-indole* (**34**). B.p. 155°/2 Torr. IR (film): 1610, 1495, 1480, 1465, 1450, 1355, 1175, 805, 735, 695. ^{1}H-NMR: 1.30 (*t*, *J* = 7.3, 3 H); 2.77 (*q*, *J* = 7.3, 2 H); 5.16 (*s*, 2 H); 6.83 (*s*, 1 H); 6.98–7.30 (*m*, 8 H); 7.52–7.67 (*m*, 1 H). ^{13}C-NMR: 14.6(*q*); 18.3(*t*); 49.7(*t*); 109.4(*d*); 117.9(*s*); 118.7(*d*); 119.0(*d*); 121.5(*d*); 124.6(*d*); 126.6(*d*); 127.3(*d*); 128.0(*s*); 128.6(*d*); 136.7(*s*); 137.8(*s*). Anal. calc. for $C_{17}H_{17}N$ (235.31): C 86.77, H 7.28, N 5.95; found: C 86.53, H 7.30, N 5.83.

*1-Butyl-3-ethyl-1*H*-indole* (**35**). B.p. 150°/2 Torr. IR (film): 1610, 1480, 1465, 1365, 1185, 735. ^{1}H-NMR: 0.91 (*t*, *J* = 6.3, 1 H); 1.31 (*t*, *J* = 7.3, 3 H); 1.41–1.65 (*m*, 2 H); 1.70–1.92 (*m*, 2 H); 2.77 (*q*, *J* = 7.3, 2 H); 4.02 (*t*, *J* = 6.8, 2 H); 6.83 (*s*, 1 H); 6.97–7.34 (*m*, 3 H); 7.53–7.63 (*m*, 1 H). ^{13}C-NMR: 13.7(*q*); 14.6(*q*); 18.3(*t*); 20.6(*t*); 32.4(*t*); 45.8(*t*); 109.1(*d*); 117.1(*s*); 118.2(*d*); 119.0(*d*); 121.2(*d*); 124.2(*d*); 127.9(*s*); 136.4(*s*). Anal. calc. for $C_{14}H_{19}N$ (201.30): C 83.53, H 9.51, N 6.96; found: C 83.59, H 9.48, N 6.88.

*3-Ethyl-1-methyl-1*H*-indole* (**36**). B.p. 145°/2 Torr ([6]: 74–6°/0.3–0.4 Torr). IR ($CHCl_3$): 1615, 1555, 1485, 1470, 1375, 1330, 1240, 910, 770, 755, 735. ^{1}H-NMR: 1.32 (*t*, *J* = 7.3, 3 H); 2.77 (*q*, *J* = 7.3, 2 H); 3.71 (*s*, 3 H); 6.81 (*s*, 1 H); 7.05–7.20 (*m*, 3 H); 7.57–7.61 (*m*, 1 H). ^{13}C-NMR: 14.7(*q*); 18.2(*t*); 32.5(*q*); 109.0(*d*); 117.3(*s*); 118.4(*d*); 119.0(*d*); 121.4(*d*); 125.4(*d*); 127.7(*s*); 137.1(*s*).

*1-Phenyl-3-propyl-1*H*-indole* (**38**). Oil. IR ($CHCl_3$): 1595, 1500, 1455, 1380, 1235, 770, 755, 695. ^{1}H-NMR: 1.03 (*t*, *J* = 7.3, 3 H); 1.71–1.85 (*m*, 2 H); 2.78 (*t*, *J* = 7.3, 2 H); 7.13–7.66 (*m*, 10 H). ^{13}C-NMR: 14.2(*q*); 23.2(*t*); 27.2(*t*); 110.4(*d*); 118.0(*s*); 119.3(*d*); 119.7(*d*); 122.2(*d*); 124.0(*d*); 125.0(*d*); 125.9(*d*); 129.2(*s*); 129.5(*d*); 136.0(*s*); 140.0(*s*).

*3-Butyl-1-phenyl-1*H*-indole* (**39**). Oil. IR ($CHCl_3$): 1595, 1500, 1455, 1375, 1230, 740, 695. ^{1}H-NMR: 0.97 (*t*, *J* = 7.3, 3 H); 1.39–1.54 (*m*, 2 H); 1.68–1.80 (*m*, 2 H); 2.81 (*t*, *J* = 7.3, 2 H); 7.13–7.35 (*m*, 4 H); 7.48–7.67 (*m*, 6 H).

*3-Ethyl-5-methyl-1-(*p*-tolyl)-1*H*-indole* (**40**). B.p. 165°/2 Torr. IR (film): 1605, 1515, 1475, 1455, 1380, 1220, 825, 795. ^{1}H-NMR: 1.35 (*t*, *J* = 7.3, 3 H); 2.38 (*s*, 3 H); 2.47 (*s*, 3 H); 2.80 (*q*, *J* = 7.3, 2 H); 6.95–7.05 (*m*, 2 H); 7.14–7.45 (*m*, 6 H). ^{13}C-NMR: 14.4(*q*); 18.3(*t*); 20.9(*q*); 21.4(*q*); 110.1(*d*); 118.8(*d*); 118.9(*s*); 123.2(*d*); 124.5(*d*); 128.2(*d*); 128.7(*s*); 129.0(*s*); 129.9(*d*); 134.5(*s*); 135.3(*s*); 137.7(*s*). Anal. calc. for $C_{18}H_{19}N$ (249.34): C 86.70, H 7.68, N 5.62; found: C 86.41, H 7.63, N 5.36.

Photolysis of 1-Acylindoline-2-thiones **11**–**p** *and 1-Acylindolin-2-ones* **2***: General Procedure.* A soln. of **1** or **2** (50 mg) in $CDCl_3$ (0.5 ml) containing 2 drops of EtOH in a NMR tube was irradiated under the same conditions for 2–10 h, and then products and yields were confirmed by NMR. A prep. scale photolysis of **1** or **2** (1 mmol) in benzene (70 ml) containing EtOH (1 ml) was carried out under the same conditions, and similar results were obtained (*Table 3*).
