#### Abstract

The enantiospecific total synthesis of the $\delta$-lactonic marine natural product ( + )-tanikolide ( $\mathbf{1}$ ), isolated from Lyngbya majuscula, was achieved using a $[2,3]$-Meisenheimer rearrangement as the key reaction. During this rearrangement, we discovered that the allylic amine $N$-oxide could direct the $m$-CPBA double-bond epoxidation to the syn position. The resulting syn product 8 underwent epoxide ring opening under the $m$-CBA conditions to give the five- and six-membered cyclic ether amine $N$-oxides, which we further treated with Zn and conc. HCl to obtain the reduced bisbenzyl tertiary amines 23 and 22 , respectively. When 23 and 22 were treated with trichloroisocyanuric acid (TCCA) in dichloromethane, oxidation at the benzyl position occurred, forming iminium ions. These intermediates were trapped by intramolecular reaction with the hydroxyls, and the resulting intermediates were then oxidized or shifted to afford 25 and 24 , respectively. The entire one-pot process involves $N$ debenzylation, $N$-chlorination, and hemiacetal oxidation. The amine $N$-oxide-directed epoxidation complements Davies' ammonium-directed epoxidation. Thus, TCCA $N$-debenzylation is described for the first time and might be a useful N debenzylation technique.

## INTRODUCTION

(+)-Tanikolide (1) is a brine-shrimp toxin and antifungal marine metabolite isolated from the lipid extract of the cyanobacterium Lyngbya majuscule on Tanikely Island, Madagascar. When tested for toxicity, this compound displayed $\mathrm{LD}_{50}$ values of $3.6 \mu \mathrm{~g} / \mathrm{mL}$ against brine shrimp and $9.0 \mu \mathrm{~g} / \mathrm{mL}$ against snails. ${ }^{1}$ Despite its potent biological activity, (+)-tanikolide $\mathbf{1}$ possesses a relatively simple molecular structure. It contains moderate functionalities (an $\alpha$-hydroxymethyl group and a $\delta$-lactone) around a synthetically challenging stereogenic quaternary carbon center. These structural features render (+)-tanikolide $\mathbf{1}$ an appropriate molecule for chemical researchers to rapidly evaluate synthetic methodologies for stereogenic tertiary alcohols. ${ }^{2}$ Since the isolation and structural identification of this natural product in

1999, a total synthesis of (+)-tanikolide 1 has been reported every year except 2001 and 2009. Among the 16 synthetic routes reported, the use of the Sharpless asymmetric epoxidation (SAE) method on a trisubstituted alkene is exceptional for its convenient execution and its reliable production of the desired carbon chirality. SAE and subsequent ring opening with alkyl ${ }^{3 a, b}$ or vinyl ${ }^{3 \mathrm{c}}$ Grignard cuprate reagents or by $\mathrm{LiEt}_{3} \mathrm{BH}$ reduction ${ }^{3 \mathrm{~d}, \mathrm{e}}$ have been demonstrated as efficient strategies for constructing chiral tertiary alcohol moieties. Other important enantioselective methodologies utilized in these 16 synthetic routes include (a) trisimidazoline-catalyzed enantioselective bromolactonization of

internal alkenoic acids, ${ }^{3 f}$ (b) catalytic asymmetric dihydroxylation of enamides, ${ }^{3 \mathrm{~g}}$ (c) cinchona alkaloid-catalyzed asymmetric addition of a $\beta$-keto ester to an acrolein ${ }^{3 \mathrm{~h}}$ with subsequent Baeyer-Villiger oxidation of the $\alpha$-chiral quaternary carbon ketone, (d) catalytic asymmetric hydrogen transfer reaction and subsequent Baeyer-Villiger oxidation of the $\alpha$-chiral quaternary carbon ketone, ${ }^{3 i}$ and (e) lipase-catalyzed kinetic resolution of a racemic diol and subsequent Baeyer-Villiger oxidation of the $\alpha$ stereogenic quaternary carbon ketone. ${ }^{3 j}$ Finally, chirality induction methodologies used in these 16 synthetic routes include (a) Barbier or Grignard reactions of D-glyceraldehyde ${ }^{3 \mathrm{k}}$ and L-erythrulose ${ }^{31}$ derivatives, (b) a D-erythrose ${ }^{3 \mathrm{~m}}$ derivativeinduced asymmetric Aldol reaction, (c) asymmetric Grignard
reactions with (S)-2-(anilinomethyl)pyrrolidine chiral auxiliaries, ${ }^{3 n}$ and (d) intramolecular chiral hydroxyl-induced asymmetric epoxidation ${ }^{30}$ and subsequent hypervalent iodine(III)-mediated oxidative rearrangement. In addition to the above methodologies, the direct utilization of a chiral tertiary alcohol in $(-)$-quinic acid $^{3 p}$ or the stereospecific insertion reaction of dichlorocarbene into a $\mathrm{C}-\mathrm{H}$ bond of a chiral secondary alcohol ${ }^{3 \mathrm{q}}$ have also been utilized.

During the enantiospecific synthesis of the homoharringtonine and harringtonine side-chain acids, we demonstrated the potential of the [2,3]-Meisenheimer rearrangement as a general strategy for constructing chiral tertiary alcohols. ${ }^{4}$ In this strategy, the $\alpha$-amino acid chirality is completely transferred to the tertiary

Scheme 2. Stereospecific and N -Oxide-Directed Epoxidation of Allylamines

alcohol. The striking features of our methodology are the predictability of the chiral carbon configuration and convenient operation at every synthetic step. For the enantioselective synthesis of the homoharringtonine and harringtonine side-chain acids, the substrate was limited to $\alpha, \beta$-unsaturated esters.

## RESULTS AND DISCUSSION

In our initial synthetic plan for ( + )-tanikolide $\mathbf{1}, \alpha, \beta$-unsaturated ester 5 was utilized (Scheme 1). Compound 5 was prepared according to our previous procedure. ${ }^{4}$ We were frustrated by the competitive Cope elimination, which provided conjugated diene 6 instead of the desired product 6a. This result was identical to the results reported by Davies and co-workers. ${ }^{5}$ If $\mathbf{6 a}$ had been obtained, it could have been transformed into (+)-tanikolide 1 within two steps. Therefore, we reduced $\alpha, \beta$-unsaturated ester 5 with LAH to obtain allylic alcohol 7. ${ }^{5}$ To our delight, the $[2,3]$ -

Meisenheimer rearrangement proceeded with the isolated olefin 7. This successful result broadened our technique's substrate availability to isolated olefins and further demonstrated the general applicability of our chiral quaternary carbon synthetic methodology.

Unfortunately, a yield of only approximately $20 \%$ of the [2,3]Meisenheimer rearrangement precursor 9 was formed, which underwent rearrangement into 13 when refluxed in dichloromethane for 2 h . When the molar ratio of $m$-CPBA to 7 was increased, the ratio of $\mathbf{8}$ to 9 also increased. When 2 equiv of $m$ CPBA was employed, 7 was transformed into 8 in $100 \%$ yield. We assumed that the undesired 8 was produced because intramolecular hydrogen bonding of the non-allyl hydroxyl with the amine $N$-oxide caused the [2,3]-Meisenheimer rearrangement to be slow. Similar intramolecular hydrogen bonding was suggested in studies by Guarna et al. ${ }^{6}$ and Davies and Smyth. ${ }^{7}$

## Scheme 3. Epoxide Ring Opening and One-Pot Debenzylation and Nitrogen Chlorination by TCCA

Treatment of 7 with acetic anhydride afforded acetoxy-protected 10 in quantitative yield. Under the $m$-CPBA conditions, 10 smoothly rearranged to give 12 in $83 \%$ yield. The stable compound 12 was purified by column chromatography, ${ }^{4}$ and transesterification of $\mathbf{1 2}$ with MeOH provided diol 13 in $95 \%$ yield. Double-bond saturation and $\mathrm{N}-\mathrm{O}$ bond cleavage using Pd/C-catalyzed hydrogenation afforded triol 14 in $93 \%$ yield. 14 could be directly oxidized to (+)-tanikolide 1 in $30 \%$ yield under $\mathrm{NaClO} / \mathrm{NaClO}_{2} /$ TEMPO conditions. ${ }^{4}$ The lower yield was observed because the primary hydroxyl group closest to the quaternary carbon side was also oxidized to a carboxyl group. Therefore, the vicinal diol in 14 was protected as acetonide 15. After oxidation with $\mathrm{NaClO} / \mathrm{NaClO}_{2} /$ TEMPO, a one-pot deprotection of acetonide with aq. HCl led to (+)-tanikolide 1 in $89 \%$ yield. The NMR, specific rotation, EIMS, and IR data were completely consistent with the literature data. ${ }^{1}$ The ee values for compounds 4 and 13 were determined by HPLC to be $98 \%$, which confirmed the complete transfer of chirality from 10 to 12. Moreover, the ee results supported our proposed transition state, which is characterized by allylic 1,3 -strain. ${ }^{4}$ In summary, our chiral tertiary alcohol synthetic methodology using a $[2,3]$-Meisenheimer rearrangement was expanded to trisubstituted isolated olefins and was applied to the enantiospecific total synthesis of (+)-tanikolide 1 . The total yield was $52.5 \%$ over nine linear steps, which is currently the highest yield of the reported synthetic routes. ${ }^{3}$

The diastereoselective formation of syn-epoxide 8 was confirmed by the method of Davies. ${ }^{8,9}$ This method involves protonation of 7 with 5 equiv of $\mathrm{Cl}_{3} \mathrm{CCO}_{2} \mathrm{H}$ to give ammonium species $7 \mathbf{a}$ and subsequent epoxidation with 1 equiv of $m$-CPBA
to afford ammonium epoxide $\mathbf{7 b}$. After deprotonation with $\mathrm{Na}_{2} \mathrm{CO}_{3}$, the dibenzylamine epoxide is oxidized again with 1 equiv of $m$-CPBA to provide 8 with $>99 \%$ diastereoselectivity (Scheme 2). The ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectra of 8 produced by the two methods were completely identical. Because Davies and coworkers have shown their method to be $>99 \%$ diastereoselective for the syn-epoxide, our method should also be $>99 \%$ diastereoselective. Presumably, the diastereoselectivity results from the most stable conformation of 7 , in which the allylic $\mathrm{C}-\mathrm{H}$ bond (i.e., $\mathrm{C}-4-\mathrm{H}$ ) is coplanar with the olefinic $\mathrm{C}-\mathrm{C}$ bond (i.e., C-2-C-1') to minimize allylic 1,3 -strain. ${ }^{9}$ Upon treatment of 7 with $m$-CPBA, the allylamine $N$-oxide formed quickly. Through electrostatic interactions or hydrogen bonding, the $N$-oxide directed the second $m$-CPBA molecule to the double bond on the same face as the $N$-oxide, leading to epoxidation rather than the [2,3]-Meisenheimer rearrangement. By surveying the literature, we discovered that Davies and co-workers reported the only $N$-oxide-directed epoxidation (using a cyclohexenyl amine oxide), and their diastereoselectivity was a mere $46 \% .^{10}$ The $46 \%$ de obtained by Davies and co-workers was in favor of the anti-epoxide product, and superior anti diastereoselectivity ( $97 \%$ de) was observed in the presence of $\mathrm{Cl}_{3} \mathrm{CCO}_{2} \mathrm{H}$. Here, we report the first aliphatic acyclic allylamine N -oxide-directed epoxidation with superior syn diastereoselectivity ( $>99 \%$ de) in excellent yield. We have demonstrated the generality of our method by synthesizing 19a, 19b, 19c, and 19d. The two routes (16a, 16b, 16c, $7 \rightarrow$ 17a, 17b, 17c, 17d $\rightarrow$ 19a, 19b, 19c, 19d and 16a, 16b, 16c, $7 \rightarrow$ 18a, 18b, 18c, $8 \rightarrow 19 a, 19 b, 19 c, 19 d)$ afforded equally good yields and diastereoselectivities ( $98 \%$ yield and $>99 \%$ syn diastereoselectivity). Our method is comple-

Scheme 4. Proposed Mechanisms for $22 \rightarrow 24$ and $23 \rightarrow 25$

mentary to the method of Davies and co-workers, particularly for substrates that could not withstand the strongly acidic conditions produced by 5 equiv of $\mathrm{Cl}_{3} \mathrm{CCO}_{2} \mathrm{H} .{ }^{8}$ Moreover, the $m$-CPBA oxidation and $\mathrm{Zn} /$ conc. HCl reduction is convenient and efficient. Both reactions can be completed within 20 min , whereas ammonium-directed epoxidations generally require longer reaction times. ${ }^{9}$

When 8 was formed in the $m$-CPBA reaction, its epoxy ring slowly opened at either side, producing a mixture of sixmembered cyclic ether 20 and five-membered cyclic ether 21 in an approximate 5 to 4 molar ratio as determined by ${ }^{1} \mathrm{H}$ NMR analysis (Scheme 3). ${ }^{11}$ We obtained pure 20 by recrystallizing it from acetone. Reduction of 20 with Zn /conc. HCl furnished 22 in almost quantitative yield. Compound 21 could not be separated from 20; however, reduction of the mixture of 20 and 21 with $\mathrm{Zn} /$ conc. HCl resulted in separable compounds 22 and 23, respectively. The structures of 20, 22, and 23 were established by ${ }^{1} \mathrm{H}-{ }^{1} \mathrm{H}$ COSY, HSQC, and HMBC experiments, as shown in Scheme 3. ${ }^{12}$ The $\delta 3.75$ methylene proton (H-6) of 20 exhibited key HMBC correlations with the $\delta 79.1$ quaternary
carbon, whereas the $\delta 3.79$ methylene proton (H-6) of 22 exhibited key HMBC correlations with the $\delta 78.4$ quaternary carbon. The $\delta 3.98-3.94$ methylene proton ( $\mathrm{H}-6$ or $\mathrm{H}-10$ ) of 23 showed key HMBC correlations with the $\delta 80.9$ methine carbon (C-2) instead of the $\delta 74.8$ quaternary carbon. To further support these assignments, we attempted to oxidize the secondary hydroxyl to the ketone carbonyl and the primary hydroxyl to the aldehyde carbonyl in $\mathbf{2 2}$. We also attempted to oxidize the primary hydroxyl to the aldehyde carbonyl in 23. After surveying a large number of reported oxidation methods, we chose a mild oxidation method reported by Giacomelli and co-workers that uses trichloroisocyanuric acid (TCCA) as a terminal oxidant. ${ }^{13}$ Treatment of $\mathbf{2 2}$ and $\mathbf{2 3}$ with a 2 -fold excess of TCCA led to the unexpected products 24 and 25 , respectively. The structure of 24 was established by HMBC correlations of the $\delta 5.75$ hemiacetal proton ( $\mathrm{H}-1$ ) with the $\delta 72.6$ methlyene carbon (C-7,8). The structure of $\mathbf{2 5}$ was established by HMBC correlations of the $\delta$ 4.37 and $\delta 4.31$ methylene protons ( $\mathrm{H}-7$ and $\mathrm{H}-8$, respectively) with the $\delta 166.4$ ester carbonyl carbon (C-1). In contrast to its analogues NCS and NBS, the chemical properties of TCCA have

${ }^{a}$ Compound 43 was prone to polymerize to form white floe after column chromatography purification at room temperature. ${ }^{b}$ Compound 49 was prone to explosion and decomposition above $10^{\circ} \mathrm{C}$. It was identified in contrast to a sample prepared according to a standard procedure. For this, see ref 26 . The yield was estimated to be more than $80 \%$ according to TLC.
not been fully understood since its discovery in 1902. ${ }^{14}$ Over the past 11 years, some important applications of TCCA in organic synthesis have been reported. The following are selected examples: (a) mild and chemoselective oxidation of alcohols to aldehydes or ketones as an alternative to Swern oxidation, ${ }^{13}$ (b) enone epoxidation, ${ }^{15}$ (c) dehydrogenation of nitrogen-containing compounds, ${ }^{16}$ (d) efficient oxidation of primary alcohols to carboxylic acids or esters, ${ }^{17}$ (e) oxidation of primary amines to nitriles or $N$-dichloride compounds, ${ }^{18}$ (f) monochlorination of amides or secondary amines, ${ }^{18,19}$ (g) mild and efficient deprotection of the amine-protecting $p$-methoxyphenyl (PMP) group, ${ }^{20}$ and (h) other reactions. ${ }^{14}$ To the best of our knowledge,
although the reactions of primary amines, secondary amines, and amides with TCCA have been well-studied, there is only one literature example of the reaction of an aliphatic tertiary amine with TCCA. ${ }^{20}$ The transformations $22 \rightarrow \mathbf{2 4}$ and $23 \rightarrow 25$ were the second example; however, the reaction models are completely different. These reactions represent the first onepot debenzylation and nitrogen chlorination of aliphatic tertiary amines using TCCA. A plausible mechanism for $22 \rightarrow 24$ and 23 $\rightarrow \mathbf{2 5}$ (Scheme 4) involves iminium ion formation (22a, 23a), intramolecular capture by the adjacent hydroxyl to form unstable $\mathrm{N}-\mathrm{O}$ acetals (22b, 23b), acid-catalyzed ring opening (22d, 23d), ${ }^{21}$ and further chlorination or chlorination plus TCCA
oxidation to form chloroamine acetal 24 and chloroamine benzoate 25, respectively. ${ }^{22,23}$

To investigate the proposed mechanism, one-pot debenzylation and nitrogen chlorination methodological studies with TCCA were performed (Table 1). In each case, 0.75 equiv of TCCA was sufficient to achieve a good to excellent yield in a short time ( $5-30 \mathrm{~min}$ ) at room temperature in dichloromethane. For entries 1-7, 9, and 13, benzaldehyde was obtained in addition to the listed $N$-debenzylation and $N$-chlorination products 27, 29, 31, 33, 35, 37, 43, and 49. Common functional groups such as esters (entries 1 and 3 ), lactones (entries 7 and 8 ), double bonds (entries 6 and 10), and TBS (entry 5) survived the TCCA conditions. Moreover, the $N$-debenzylation and $N$ chlorination reaction rate was observed to be faster than the O debenzylation rate (entry 4$)^{24}$ and the hydroxyl oxidation rate (entry 8 and for $\mathbf{2 2} \boldsymbol{\mathbf { 2 4 }}$ and $\mathbf{2 3} \boldsymbol{\rightarrow 2 5}$ ). ${ }^{13,25} \mathrm{~N}$-Monobenzylated substrates afforded the N -debenzylated and N -chlorinated compounds as the major products (entries 9 and 13). When $N$-benzyl was substituted with $N$-allyl or $N$-alkyl, N -deallylated or N -dealkylated compounds were the major products (entries 10 and 11). The example of entry 12 demonstrates that an $N$-alkyl group with a more acidic $\alpha$ proton could be preferentially removed from the nitrogen atom. The example in entry 13 illustrates that N -dealkylation and N -chlorination occurred on one fragment, whereas oxidation occurred on another fragment. The relative configuration of the stereogenic center of compound 41 was determined by 2D NMR and NOESY, and the configuration was inconsistent with a concerted reaction mechanism. ${ }^{27}$

## CONCLUSIONS

The enantiospecific total synthesis of (+)-tanikolide was successfully completed over nine linear steps in $52.5 \%$ overall yield. This efficient and convenient synthesis further demonstrates the reliability and practicality of our chiral tertiary alcohol methodology using the [2,3]-Meisenheimer rearrangement. The substrate scope for these [2,3]-Meisenheimer rearrangements was expanded to nonconjugated olefins with high diastereoselectivity, and N -oxide-directed epoxidations using aliphatic acyclic compounds were discovered for the first time. This discovery enabled the rapid synthesis of a large number of branched-chain amino sugars with chiral tertiary alcohol moieties. ${ }^{28}$ For example, (+)-lycoperdic acid was conveniently synthesized using our methodology, and we will soon report the results. ${ }^{29}$ In addition to the $N$-oxide-directed epoxidations, onepot $N$-debenzylation and $N$-chlorination in combination with reported $N$-dechlorination ${ }^{30,31}$ would be a mild $N$-debenzylation methodology ${ }^{32}$ that would be a beneficial complement to currently available methods. ${ }^{33}$ The substrate scope and reaction capabilities for these one-pot N -debenzylations and N chlorinations are being investigated in detail; the experimental results will be reported shortly. The one-pot $N$-debenzylation and N -chlorination also constitutes an aliphatic tertiary amine oxidation, and the dealkylated product could be oxidized to an aldehyde or ketone. Currently, we are attempting to oxidize primary amines ${ }^{34}$ to aldehydes or ketones using TCCA, and our results will be reported in due course.

## - EXPERIMENTAL SECTION

General Methods. For general methods, see our previous paper (i.e., ref 4).

General Procedure for Allylic Amine N -Oxide-Directed Epoxidation: The Preparation of Compounds 8, 18a, 18b, and

18c. To a solution of allylic amine 7 (or 16a, 16b, or $\mathbf{1 6 c}$ ) $(1 \mathrm{mmol})$ in dry $\mathrm{CH}_{2} \mathrm{Cl}_{2}(6 \mathrm{~mL})$ was added $m$-CPBA $(2 \mathrm{mmol})$ at $5^{\circ} \mathrm{C}$. The reaction mixture was stirred for $5 \mathrm{~min} . \mathrm{CH}_{2} \mathrm{Cl}_{2}$ was removed under reduced pressure at $35^{\circ} \mathrm{C}$. The residue was purified by column chromatography on basic alumina (gradient elution, EtOAc at first, then acetone or methanol) to give pure 8 (or 18a, 18b, or $\mathbf{1 8 c}$ ) in almost quantative yield.

General Procedure for Amine $N$-Oxide Reduction To Give Tertiary Amines with $\mathrm{Zn} /$ Conc. HCl : The Preparation of Compounds 19a, 19b, 19c, 19d, 22, and 23. To a solution of epoxy amine $N$-oxide 18a (or 18b, 18c, 8, 20, or 21) ( 1 mmol ) in $\mathrm{MeOH}(20 \mathrm{~mL})$ were added Zn powder $(5 \mathrm{mmol})$ and conc. $\mathrm{HCl}(0.42$ $\mathrm{mL}, 5 \mathrm{mmol}$ ) with vigorous stirring. The reaction mixture was stirred for 3 min , and conc. $\mathrm{NH}_{3} \cdot \mathrm{H}_{2} \mathrm{O}$ was added to adjust the pH to 7 at $5^{\circ} \mathrm{C}$; the mixture was then extracted with $\mathrm{EtOAc}(3 \times 40 \mathrm{~mL})$. The combined organic phases were washed with saturated $\mathrm{Na}_{2} \mathrm{CO}_{3}$, dried (magnesium sulfate), filtered, and concentrated in vacuo. The residue was purified by column chromatography on silica gel (petroleum ether/EtOAc) to give pure 19a (or 19b, 19c, 19d, 22, or 23) in almost quantative yield.
General Procedure for One-Pot $N$-Debenzylation and $N$ Chlorination with TCCA: The Preparation of Compounds 24, 25, 27, 29, 31, 33, 35, 37, 39, 41, 43, and 49. To a solution of benzylamine compound ( 1 mmol ) in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(6 \mathrm{~mL})$ was added TCCA $(0.75 \mathrm{mmol})$ at $5{ }^{\circ} \mathrm{C}$. The reaction mixture was stirred for $3-30 \mathrm{~min}$, diluted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(30 \mathrm{~mL})$, and then filtered through basic alumina. After concentration, the residue was purified by column chromatography on silica gel (petroleum ether/EtOAc) to give the pure N debenzylation and $N$-chlorination product 24, 25, 27, 29, 31, 33, 35, 37, $39,41,43$, or 49.

Ethyl 2-(Triphenylphosphoranylidene)tridecanoate (3). ${ }^{35} \mathrm{~A}$ solution of 1-bromododecane ( $11.87 \mathrm{~g}, 47.78 \mathrm{mmol}$ ) and triphenylphosphane ( $12.86 \mathrm{~g}, 50.17 \mathrm{mmol}$ ) in toluene was refluxed for 3 days. The resulting white triphenylphosphine Wittig salt ( $24.42 \mathrm{~g}, 47.7 \mathrm{mmol}$, $99 \%$ ) was filtered and dried overnight in a vacuum desiccator. To a solution of $n$-dodecylphosphonium bromide ( 24.4 g ) in dry THF ( 175 mL ) was added ${ }^{\mathrm{t}} \mathrm{BuOK}(5.36 \mathrm{~g}, 47.78 \mathrm{mmol})$ rapidly at $5^{\circ} \mathrm{C}$ under $\mathrm{N}_{2}$. The reaction mixture was stirred at this temperature for 2 h , and the colorless transparent solution gradually became turbid orange-red. To this was added a solution of ethyl chloroformate ( $2.26 \mathrm{~mL}, 23.8 \mathrm{mmol}$ ) in dry THF ( 40 mL ) dropwise at $5^{\circ} \mathrm{C}$ under $\mathrm{N}_{2}$. The reaction mixture was stirred continually at this temperature for 2 h , and the turbid orangered solution became light yellow. The suspension was filtered, and the filtrate was concentrated under reduced pressure to give a deep-orangered oil, which was used for next step without further purification.
( $R, E$ )-Dimethyl 4-((tert-Butoxycarbonyl)amino)-2-propylhex-2-enedioate (4). To a solution of $2(3.19 \mathrm{~g}, 13.7 \mathrm{mmol})$ and TEA (11.4 $\mathrm{mL}, 82.1 \mathrm{mmol})$ in dry $\mathrm{CH}_{2} \mathrm{Cl}_{2}(30 \mathrm{~mL})$ was added $\mathrm{Py} \cdot \mathrm{SO}_{3}(13.1 \mathrm{~g}, 82.1$ $\mathrm{mmol})$ in dry DMSO $(30 \mathrm{~mL})$ at $5{ }^{\circ} \mathrm{C} .{ }^{36}$ The reaction mixture was allowed to warm to room temperature. The reaction mixture was then stirred at room temperature for 35 min (longer times were used on larger scales, monitored by TLC), and the reaction was quenched with water/ice $(120 \mathrm{~mL})$. The mixture was extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(3 \times 200$ mL ). The organics were washed successively with $10 \%$ citric acid ( $3 \times 40$ $\mathrm{mL}), \mathrm{H}_{2} \mathrm{O}(3 \times 40 \mathrm{~mL})$, saturated $\mathrm{NaHCO}_{3}(30 \mathrm{~mL})$, and brine ( 30 mL ). After drying over $\mathrm{MgSO}_{4}$, the organics were concentrated under reduced pressure, yielding the crude aldehyde ( $3.01 \mathrm{~g}, 13.0 \mathrm{mmol}, 95 \%$ ) as a red oil, which was used immediately in the next step without further purification. To a solution of the crude aldehyde $(2.76 \mathrm{~g}, 11.9 \mathrm{mmol})$ in dry $\mathrm{CHCl}_{3}(60 \mathrm{~mL})$ was added freshly prepared Wittig reagent $3(8.93 \mathrm{~g}$, $17.85 \mathrm{mmol})$ in dry $\mathrm{CHCl}_{3}(60 \mathrm{~mL})$ at $5^{\circ} \mathrm{C}$. The reaction mixture was stirred at $5{ }^{\circ} \mathrm{C}$ for 30 min (longer times were used on larger scales, monitored by TLC), and $\mathrm{CHCl}_{3}$ was then removed under reduced pressure. The residue was purified by chromatography on silica gel (petroleum ether/EtOAc 6:1, $R_{\mathrm{f}}=0.3$ ) to yield $4(5.80 \mathrm{~g}, 12.7 \mathrm{mmol}$, $93 \%$ ) as a colorless oil. $[\alpha]_{D}^{20}=1.30\left(c 1.54, \mathrm{CHCl}_{3}\right.$ ). IR ( KBr ): 3374, 2923, 2854, 1747, $1648 \mathrm{~cm}^{-1} .{ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta 6.59$ (d, J $=9.40 \mathrm{~Hz}, 1 \mathrm{H}), 5.23(\mathrm{~s}, 1 \mathrm{H}), 4.81(\mathrm{~s}, 1 \mathrm{H}), 4.19(\mathrm{q}, J=7.08 \mathrm{~Hz}, 2 \mathrm{H}), 3.70$ ( $\mathrm{s}, 3 \mathrm{H}), 2.66(\mathrm{dd}, J=16.01,4.32 \mathrm{~Hz}, 1 \mathrm{H}), 2.59(\mathrm{dd}, J=16.21,5.63 \mathrm{~Hz}$, $1 \mathrm{H}), 2.48-2.27(\mathrm{~m}, 2 \mathrm{H}), 1.43(\mathrm{~s}, 9 \mathrm{H}), 1.35-1.23(\mathrm{~m}, 21 \mathrm{H}), 0.88(\mathrm{t}, \mathrm{J}=$ $7.12 \mathrm{~Hz}, 3 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( $100 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta 171.2$, 167.6, 154.7,

Davies' Method. The experimental procedure for $7 \rightarrow 7 \mathbf{a} \rightarrow 7 \mathbf{b}$ strictly conformed to that reported by Davies. ${ }^{8}$ When $7 \mathbf{b}(1 \mathrm{mmol})$ was formed in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ solution, the solution was diluted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(50$ $\mathrm{mL})$ and washed with saturated $\mathrm{Na}_{2} \mathrm{CO}_{3}(4 \times 7 \mathrm{~mL})$ and brine $(2 \times 7$ mL ). The $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ was concentrated to 10 mL under reduced pressure. To the concentrated solution was added $m$-CPBA ( 1 mmol ) at room temperature. The reaction mixture was stirred for 10 min at this temperature. $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ was removed under reduced pressure at $35{ }^{\circ} \mathrm{C}$ water bath temperature. The residue was purified by column chromatography on basic alumina (gradient elution, EtOAc at first, then acetone) to give pure 8 as a white powder $(0.209 \mathrm{~g}, 98 \%)$. The NMR data for 8 obtained by this method were completely identical to those for 8 obtained using our method.
( $R, E$ )-4-(Dibenzylamino)-2-methylpent-2-en-1-ol (16a). Compound 16a was prepared according to the experimental procedure used for compound 7. Compound 16a was obtained as a colorless liquid (277 $\mathrm{mg}, 94 \%$ based on 1 mmol of substrate). $R_{\mathrm{f}}=0.3$ (petroleum ether/ EtOAc 5:1). IR (KBr): 3386, $3061 \mathrm{~cm}^{-1} .{ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta 7.47-7.45(\mathrm{~m}, 4 \mathrm{H}), 7.39-7.34(\mathrm{~m}, 4 \mathrm{H}), 7.31-7.25(\mathrm{~m}, 2 \mathrm{H}), 5.57(\mathrm{~d}, J$ $=9.36 \mathrm{~Hz}, 1 \mathrm{H}), 4.09(\mathrm{~s}, 2 \mathrm{H}), 3.81(\mathrm{~d}, J=13.92 \mathrm{~Hz}, 2 \mathrm{H}), 3.68-3.60(\mathrm{~m}$, $1 \mathrm{H}), 3.55(\mathrm{~d}, J=13.96 \mathrm{~Hz}, 2 \mathrm{H}), 1.77(\mathrm{brs}, 1 \mathrm{H}), 1.57(\mathrm{~s}, 3 \mathrm{H}), 1.26(\mathrm{~d}, J=$ $6.76 \mathrm{~Hz}, 3 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( $100 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta 140.9,137.0,128.6$, 128.2, 126.7, 125.9, 68.6, 54.0, 51.1, 18.2, 14.1. HRMS (ESI-TOF) $m / z$ $[\mathrm{M}+\mathrm{H}]^{+}$calcd for $\mathrm{C}_{20} \mathrm{H}_{26} \mathrm{NO}$ 296.2014, found 296.2014.
( $R, E$ )-4-(Dibenzylamino)-2-propylhex-2-ene-1,6-diol (16b). Compound 16 b was prepared according to the experimental procedure used for compound 7 . Compound $\mathbf{1 6 b}$ was obtained as a colorless liquid ( $335 \mathrm{mg}, 95 \%$ based on 1 mmol of substrate). $R_{\mathrm{f}}=0.3$ (petroleum ether/ EtOAc 1.5:1). IR ( KBr ): $3419,3027 \mathrm{~cm}^{-1} .{ }^{1} \mathrm{H}$ NMR ( 400 MHz , $\left.\mathrm{CDCl}_{3}\right): \delta 7.40-7.32(\mathrm{~m}, 8 \mathrm{H}), 7.29-7.24(\mathrm{~m}, 2 \mathrm{H}), 5.65(\mathrm{~d}, J=10.20$ $\mathrm{Hz}, 1 \mathrm{H}), 4.19(\mathrm{~d}, J=13.60 \mathrm{~Hz}, 1 \mathrm{H}), 4.15(\mathrm{~d}, J=13.52 \mathrm{~Hz}, 1 \mathrm{H}), 3.99(\mathrm{~d}, J$ $=13.52 \mathrm{~Hz}, 2 \mathrm{H}), 3.86-3.78(\mathrm{~m}, 1 \mathrm{H}), 3.74-3.66(\mathrm{td}, J=9.56,3.92 \mathrm{~Hz}$, 2 H ), $3.36(\mathrm{~d}, J=13.48 \mathrm{~Hz}, 2 \mathrm{H}), 2.22-2.11(\mathrm{~m}, 1 \mathrm{H}), 2.06-1.88(\mathrm{~m}$, $2 \mathrm{H}), 1.48-1.27(\mathrm{~m}, 3 \mathrm{H}), 0.82(\mathrm{t}, J=7.32 \mathrm{~Hz}, 3 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( 100 $\mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta 143.4,139.3,128.8,128.5,127.2,121.6,66.3,62.4$, 55.6, 53.9, 34.5, 30.7, 21.8, 14.2. HRMS (ESI-TOF) $\mathrm{m} / \mathrm{z}[\mathrm{M}+\mathrm{Na}]^{+}$ calcd for $\mathrm{C}_{23} \mathrm{H}_{31} \mathrm{NO}_{2} \mathrm{Na} 376.2252$, found 376.2252 .
( $R, E$ )-N,N-Dibenzyl-4-methylhex-3-en-2-amine (16c). To a solution of 16a ( $285 \mathrm{mg}, 0.965 \mathrm{mmol}$ ) in dry $\mathrm{CH}_{2} \mathrm{Cl}_{2}(7 \mathrm{~mL})$ were added $\mathrm{MsCl}(235.9 \mathrm{mg}, 1.931 \mathrm{mmol})$, $\mathrm{Et}_{3} \mathrm{~N}$ ( $195.4 \mathrm{mg}, 1.931 \mathrm{mmol}$ ), and DMAP ( $23.6 \mathrm{mg}, 0.193 \mathrm{mmol}$ ) at $5^{\circ} \mathrm{C}$. After the reactin mixture was stirred at $5^{\circ} \mathrm{C}$ for $1 \mathrm{~h}, \mathrm{MsCl}(235.9 \mathrm{mg}, 1.931 \mathrm{mmol})$ and $\mathrm{Et}_{3} \mathrm{~N}(195.4$ $\mathrm{mg}, 1.931 \mathrm{mmol}$ ) were further added to the reaction mixture, which was stirred for an additional 1 h . Next, the reaction temperature was elevated to room temperature, and the reaction was further continued for 2 h . The reaction mixture was poured into ice-water $(30 \mathrm{~mL})$ and extracted with EtOAc ( $3 \times 60 \mathrm{~mL}$ ), which was washed successively with $5 \%$ aq. $\mathrm{HCl}(30 \mathrm{~mL})$, saturated aq. $\mathrm{NaHCO}_{3}(30 \mathrm{~mL})$ and brine $(50 \mathrm{~mL})$, after which the organic layer was dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$. This mesylate was employed without further purification for the next reaction. To a solution of the crude mesylate in dry THF ( 10 mL ) was added $\mathrm{LiAlH}_{4}$ $(128.23 \mathrm{mg}, 3.38 \mathrm{mmol})$ in a small portion over 30 min . After the reaction mixture was stirred at room temperature for 1 h , the reaction
was quenched by the addition of $\mathrm{H}_{2} \mathrm{O}(0.128 \mathrm{~mL}), 15 \% \mathrm{NaOH}(0.128$ $\mathrm{mL})$, and $\mathrm{H}_{2} \mathrm{O}(0.384 \mathrm{~mL})$ subsequently. The white solids were filtered. The filtrate was concentrated, and the residue was purified by chromatography on silica gel (petroleum ether/EtOAc 20:1, $R_{\mathrm{f}}=0.3$ ) to yield 16c ( $218 \mathrm{mg}, 81 \%$ ) as a colorless oil. IR ( KBr ): 3084, 3061, 3026, $1602 \mathrm{~cm}^{-1} .{ }^{1} \mathrm{H} \operatorname{NMR}\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right): \delta 7.50-7.45(\mathrm{~m}, 4 \mathrm{H})$, $7.39-7.35(\mathrm{~m}, 4 \mathrm{H}), 7.35-7.26(\mathrm{~m}, 2 \mathrm{H}), 5.31(\mathrm{~d}, J=9.24 \mathrm{~Hz}, 1 \mathrm{H}), 3.81$ $(\mathrm{d}, J=13.92 \mathrm{~Hz}, 2 \mathrm{H}), 3.59-3.50(\mathrm{~m}, 1 \mathrm{H}), 3.52(\mathrm{~d}, J=14.08 \mathrm{~Hz}, 2 \mathrm{H})$, $1.84(\mathrm{~s}, 3 \mathrm{H}), 1.55(\mathrm{~s}, 3 \mathrm{H}), 1.24(\mathrm{~d}, J=6.60 \mathrm{~Hz}, 3 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( 100 $\mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta 141.1,134.1,128.6,128.1,126.6,125.3,53.9,51.3$, 26.0, 18.6, 18.4. (2R,3S,4R)-N,N-Dibenzyl-3-hydroxy-2-(hydroxymethyl)-2-undecyltetrahydro-2H-pyran-4-amine Oxide (20) and ( $2 R, 3 R$ )-N,N-Dibenzyl-2-((S)-1,2-dihydroxytridecan-2-yl)tetrahydro-furan-3-amine Oxide (21). To a solution of $7(2.00 \mathrm{~g}, 4.3 \mathrm{mmol})$ in dry $\mathrm{CH}_{2} \mathrm{Cl}_{2}(60 \mathrm{~mL})$ was added $m-\mathrm{CPBA}(2.04 \mathrm{~g}, 80 \%, 9.5 \mathrm{mmol})$ at 5 ${ }^{\circ} \mathrm{C}$. Compound 8 was immediately produced. The reaction mixture was stirred for $12 \mathrm{~h} . \mathrm{CH}_{2} \mathrm{Cl}_{2}$ was removed under reduced pressure. The residue was purified by column chromatography on silica gel (petroleum ether/EtOAc 2:1) to give 20 and 21 as an inseparable mixture ( 1.95 g , $3.9 \mathrm{mmol}, 91 \%)$. Recrystallization of the mixture from acetone afforded pure 20 as a white solid ( $0.53 \mathrm{~g}, 1.06 \mathrm{mmol}$ ). Mp $115.1-116.3^{\circ} \mathrm{C}$ (petroleum ether $/ \mathrm{CH}_{2} \mathrm{Cl}_{2}$ ). (S)-N,N-Dibenzyl-1,4-bis(benzyloxy)butan-2-amine (32). The preparation of compound 32 was analogous to that used for the preparation of compound $\mathbf{2 7}$. Compound $\mathbf{3 0}$ was obtained as a colorless oil ( $339 \mathrm{mg}, 73 \%$ based on 1 mmol of substrate). $R_{\mathrm{f}}=0.3$ (petroleum ether/EtOAc 40:1). IR ( KBr ): 3085, 3062, $3028 \mathrm{~cm}^{-1} .{ }^{1} \mathrm{H}$ NMR (400 $\left.\mathrm{MHz}, \mathrm{CDCl}_{3}\right): \delta 7.42-7.26(\mathrm{~m}, 20 \mathrm{H}), 4.61-4.40(\mathrm{~m}, 4 \mathrm{H}), 3.86(\mathrm{~d}, J=$ $13.7 \mathrm{~Hz}, 2 \mathrm{H}), 3.75-3.50(\mathrm{~m}, 6 \mathrm{H}), 3.17-3.11(\mathrm{~m}, 1 \mathrm{H}), 2.04-1.95(\mathrm{~m}$, $1 \mathrm{H}), 1.88-1.71(\mathrm{~m}, 1 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( $100 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta 140.6,138.7$, 128.9, 128.4, 128.3, 128.2, 127.8, 127.5, 126.8, 73.2, 72.9, 71.0, 68.4, 54.4, 54.2, 29.4. HRMS (ESI-TOF) $m / z[\mathrm{M}+\mathrm{Na}]^{+}$calcd for $\mathrm{C}_{32} \mathrm{H}_{35} \mathrm{NNaO}_{2} 488.2565$, found 488.2565 .
(S)-N-Benzyl-1,4-bis(benzyloxy)-N-chlorobutan-2-amine (33). Colorless oil ( 389 mg , 95\%). $R_{\mathrm{f}}=0.3$ (petroleum ether/EtOAc 40:1). IR (KBr): 3061, 3029, 1720, $1641 \mathrm{~cm}^{-1} .{ }^{1} \mathrm{H}$ NMR ( 400 MHz , $\left.\mathrm{CDCl}_{3}\right): \delta 7.40-7.25(\mathrm{~m}, 15 \mathrm{H}), 4.60(\mathrm{~s}, 2 \mathrm{H}), 4.56(\mathrm{~s}, 2 \mathrm{H}), 4.33(\mathrm{q}, J=$ $13.8 \mathrm{~Hz}, 2 \mathrm{H}), 4.02-3.97(\mathrm{~m}, 1 \mathrm{H}), 3.70-3.67(\mathrm{~m}, 1 \mathrm{H}), 3.67-3.60(\mathrm{~m}$, $2 \mathrm{H}), 3.60-3.50(\mathrm{~m}, 1 \mathrm{H}), 2.06-1.99(\mathrm{~m}, 1 \mathrm{H}), 1.90-1.83(\mathrm{~m}, 1 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( $100 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta 138.5,138.3,138.0,128.9,128.4,128.4$, 128.3, 127.7, 127.6, 127.6, 73.3, 73.0, 70.8, 67.2, 65.2, 64.2, 30.1. HRMS
(ESI-TOF) $m / z[\mathrm{M}+\mathrm{Na}]^{+}$calcd for $\mathrm{C}_{25} \mathrm{H}_{28} \mathrm{ClNNaO}_{2} 432.1706$, found 432.1707.
(S)-N,N-Dibenzyl-2,2,3,3,10,10,11,11-octamethyl-4,9-dioxa-3,10-disiladodecan-6-amine (34). The preparation of compound 34 was analogous to that used for the preparation of compound 27. Compound 34 was obtained as a colorless oil ( $456 \mathrm{mg}, 89 \%$ ). $R_{\mathrm{f}}=0.3$ (petroleum ether). IR $(\mathrm{KBr}): 3085,3063,3027 \mathrm{~cm}^{-1} .{ }^{1} \mathrm{H}$ NMR (400 $\left.\mathrm{MHz}, \mathrm{CDCl}_{3}\right): \delta 7.42-7.34(\mathrm{~m}, 4 \mathrm{H}), 7.33-7.31(\mathrm{~m}, 4 \mathrm{H}), 7.29-7.22$ $(\mathrm{m}, 2 \mathrm{H}), 3.85-7.73(\mathrm{~m}, 7 \mathrm{H}), 3.66-3.60(\mathrm{~m}, 1 \mathrm{H}), 2.91-2.85(\mathrm{~m}, 1 \mathrm{H})$, $1.91-1.85(\mathrm{~m}, 1 \mathrm{H}), 1.73-1.66(\mathrm{~m}, 1 \mathrm{H}), 0.98(\mathrm{~s}, 9 \mathrm{H}), 0.91(\mathrm{~s}, 9 \mathrm{H}), 0.11$ $(\mathrm{s}, 6 \mathrm{H}), 0.06(\mathrm{~s}, 6 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( $100 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta 140.9,128.7$, 128.1, 126.6, 63.5, 61.7, 55.7, 54.5, 31.9, 26.0, 18.4, 18.2, -5.2, -5.2 , $-5.4,-5.5$. HRMS (ESI-TOF) $m / z[\mathrm{M}+\mathrm{Na}]^{+}$calcd for $\mathrm{C}_{30} \mathrm{H}_{51} \mathrm{NNaO}_{2} \mathrm{Si}_{2}$ 536.3356, found 536.3356.
(S)- N -Benzyl- N -chloro-2,2,3,3,10,10,11,11-octamethyl-4,9-dioxa-3,10-disiladodecan-6-amine (35). Colorless oil (434 mg, $95 \%$ ). $R_{\mathrm{f}}=0.3$ (petroleum ether). IR ( KBr ): $3031 \mathrm{~cm}^{-1} .{ }^{1} \mathrm{H}$ NMR ( 400 $\left.\mathrm{MHz}, \mathrm{CDCl}_{3}\right): \delta 7.43-7.31(\mathrm{~m}, 5 \mathrm{H}), 4.41(\mathrm{~d}, J=14.28 \mathrm{~Hz}, 1 \mathrm{H}), 4.30(\mathrm{~d}$, $J=14.28 \mathrm{~Hz}, 1 \mathrm{H}), 4.14-4.09(\mathrm{~m}, 1 \mathrm{H}), 3.86-3.76(\mathrm{~m}, 3 \mathrm{H}), 3.69-3.33$ $(\mathrm{m}, 1 \mathrm{H}), 1.98-1.85(\mathrm{~m}, 1 \mathrm{H}), 1.85-1.75(\mathrm{~m}, 1 \mathrm{H}), 0.99(\mathrm{~s}, 9 \mathrm{H}), 0.96(\mathrm{~s}$, $9 \mathrm{H}), 0.17(\mathrm{~s}, 6 \mathrm{H}), 0.12(\mathrm{~s}, 6 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR $\left(100 \mathrm{MHz}, \mathrm{CDCl}_{3}\right): \delta 138.4$, 128.7, 128.3, 127.5, 66.4, 65.1, 63.7, 60.3, 32.5, 26.0, 26.0, 18.3, 18.3, $-5.2,-5.3,-5.4$. HRMS (ESI-TOF) $m / z[\mathrm{M}+\mathrm{Na}]^{+}$calcd for $\mathrm{C}_{23} \mathrm{H}_{44} \mathrm{NNaO}_{2} \mathrm{Si}_{2} 480.2497$, found 480.2498 .
(S)-1,4-Bis(allyloxy)-N,N-dibenzylbutan-2-amine (36). The preparation of compound 36 was analogous to that used for the preparation of compound 27. Compound 36 was obtained as a colorless oil ( $290 \mathrm{mg}, 85 \%$ ). $R_{\mathrm{f}}=0.3$ (petroleum ether/EtOAc 35:1). IR (KBr): 3083, 3062, 3027, $1646 \mathrm{~cm}^{-1} .{ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta 7.49-$ $7.29(\mathrm{~m}, 10 \mathrm{H}), 6.04-5.91(\mathrm{~m}, 2 \mathrm{H}), 5.43-5.23(\mathrm{~m}, 4 \mathrm{H}), 4.07(\mathrm{~d}, J=5.12$ $\mathrm{Hz}, 2 \mathrm{H}), 3.97(\mathrm{~d}, J=5.56 \mathrm{~Hz}, 2 \mathrm{H}), 3.90(\mathrm{~d}, J=13.72 \mathrm{~Hz}, 2 \mathrm{H}), 3.77(\mathrm{~d}, J$ $=12.96 \mathrm{~Hz}, 2 \mathrm{H}), 3.79-3.74(\mathrm{~m}, 1 \mathrm{H}), 3.74-3.50(\mathrm{~m}, 3 \mathrm{H}), 3.15-3.08$ $(\mathrm{m}, 1 \mathrm{H}), 2.03-1.94(\mathrm{~m}, 1 \mathrm{H}), 1.86-1.77(\mathrm{~m}, 1 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR $(100 \mathrm{MHz}$, $\left.\mathrm{CDCl}_{3}\right): \delta 140.7,135.2,129.0,128.2,126.8,116.6,116.5,72.1,71.8$, 71.1, 68.4, 54.4, 54.1, 29.4. HRMS (ESI-TOF) $\mathrm{m} / \mathrm{z}[\mathrm{M}+\mathrm{Na}]^{+}$calcd for $\mathrm{C}_{24} \mathrm{H}_{21} \mathrm{NNaO}_{2}$ 365.2355, found 365.2357.
(S)-1,4-Bis(allyloxy)-N-benzyl-N-chlorobutan-2-amine (37). Colorless oil ( $287 \mathrm{mg}, 93 \%$ ). $R_{\mathrm{f}}=0.3$ (petroleum ether/EtOAc 35:1). IR (KBr): 2953, 2924, 2853, $1646 \mathrm{~cm}^{-1} .{ }^{1} \mathrm{H} \operatorname{NMR}\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right): \delta$ $7.39-7.29(\mathrm{~m}, 5 \mathrm{H}), 5.99-5.88(\mathrm{~m}, 2 \mathrm{H}), 5.36-5.21(\mathrm{~m}, 4 \mathrm{H}), 4.35-4.25$ $(\mathrm{m}, 2 \mathrm{H}), 4.10-3.92(\mathrm{~m}, 5 \mathrm{H}), 3.92-3.53(\mathrm{~m}, 4 \mathrm{H}), 2.02-1.94(\mathrm{~m}, 1 \mathrm{H})$, $1.84-1.76(\mathrm{~m}, 1 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( $100 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta$ 138.1, 135.0, 134.8, 128.9, 128.3, 127.6, 116.9, 72.1, 71.9, 70.7, 67.2, 65.2, 64.1, 30.0. HRMS (ESI-TOF) $m / z[\mathrm{M}+\mathrm{Na}]^{+}$calcd for $\mathrm{C}_{17} \mathrm{H}_{24} \mathrm{ClNNaO}_{2}$ 332.1393, found 332.1395.
(S,E)-3-(2-(Benzylchloroamino)propylidene)dihydrofuran-2(3H)-one (39). The known compound $38^{4,39}$ was transformed into 39 according to the general procedure above. Compound 39 was obtained as a colorless oil ( $241 \mathrm{mg}, 91 \%$ ). $R_{\mathrm{f}}=0.3$ (petroleum ether/EtOAc 4:1). IR (KBr): 3030, 1754, $1680 \mathrm{~cm}^{-1} .{ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta$ $7.40-7.30(\mathrm{~m}, 5 \mathrm{H}), 6.96(\mathrm{dt}, J=8.52,2.84 \mathrm{~Hz}, 1 \mathrm{H}), 4.42-4.38(\mathrm{~m}, 2 \mathrm{H})$, $4.16(\mathrm{~d}, J=13.36 \mathrm{~Hz}, 1 \mathrm{H}), 4.05(\mathrm{~d}, J=13.36 \mathrm{~Hz}, 1 \mathrm{H}), 3.84-3.76(\mathrm{~m}$, $1 \mathrm{H}), 2,87-2.82(\mathrm{~m}, 1 \mathrm{H}), 1.43(\mathrm{~d}, J=6.52 \mathrm{~Hz}, 3 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR $(100$ $\left.\mathrm{MHz}, \mathrm{CDCl}_{3}\right): \delta 170.7,138.6,136.8,128.9,128.5,128.0,127.8,65.5$, 64.5, 62.7, 25.4, 17.6. HRMS (ESI-TOF) $\mathrm{m} / \mathrm{z}[\mathrm{M}+\mathrm{Na}]^{+}$calcd for $\mathrm{C}_{14} \mathrm{H}_{16} \mathrm{ClNNaO}_{2}$ 288.0767, found 288.0768 .
( $R, E$ )-3-(2-(Dibenzylamino)-3-hydroxypropylidene)dihydro-furan-2(3H)-one (40). Compound 40 was prepared according to the procedure developed in ref 4 . Compound 40 was obtained as a white solid ( 300 mg , $89 \%$ based on 1 mmol of substrate). Mp $139.7-140.5^{\circ} \mathrm{C}$ ( EtOAc ). $R_{\mathrm{f}}=0.3$ (petroleum ether/EtOAc 5:1). IR ( KBr ): 3445, 3025, $1748,1678 \mathrm{~cm}^{-1} .{ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta 7.37-7.28(\mathrm{~m}, 10 \mathrm{H})$, $6.91(\mathrm{~d}, J=9.88 \mathrm{~Hz}, 1 \mathrm{H}), 4.50-4.30(\mathrm{~m}, 2 \mathrm{H}), 4.02(\mathrm{~d}, J=13.52 \mathrm{~Hz}$, $2 \mathrm{H}), 3.80-3.75(\mathrm{~m}, 1 \mathrm{H}), 3.75-3.55(\mathrm{~m}, 1 \mathrm{H}), 3.48(\mathrm{~d}, J=13.52 \mathrm{~Hz}$, $2 \mathrm{H}), 3.50-3.40(\mathrm{~m}, 1 \mathrm{H}), 3.00-2.80($ brs, 1 H$), 2.80-2,65(\mathrm{~m}, 2 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( $100 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta 170.4,138.6,134.1,130.7,128.7,128.7$, 127.5, 65.5, 60.3, 59.9, 54.1, 25.4. HRMS (ESI-TOF) $\mathrm{m} / \mathrm{z}[\mathrm{M}+\mathrm{Na}]^{+}$ calcd for $\mathrm{C}_{21} \mathrm{H}_{23} \mathrm{NNaO}_{3} 360.1576$, found 360.1578 .
(2S,3S,4S)-1-Benzyl-4-chloro-2-(chloromethyl)-4-(2-hydrox-yethyl)-5-oxopyrrolidin-3-yl Benzoate (41). Crystalline solid (316
$\mathrm{mg}, 75 \%), \mathrm{mp} 65.5-66.4{ }^{\circ} \mathrm{C}$ (EtOAc). $R_{\mathrm{f}}=0.3$ (petroleum ether/ EtOAc 4:1). IR (KBr): 3445, 3064, 3031, $1715 \mathrm{~cm}^{-1} .{ }^{1} \mathrm{H}$ NMR (400 $\left.\mathrm{MHz}, \mathrm{CDCl}_{3}\right): \delta 8.10(\mathrm{~d}, J=2.96 \mathrm{~Hz}, 2 \mathrm{H}), 7.75-7.65(\mathrm{~m}, 1 \mathrm{H}), 7.65-$ $7.49(\mathrm{~m}, 2 \mathrm{H}), 7.49-7.25(\mathrm{~m}, 5 \mathrm{H}), 5.79(\mathrm{~d}, J=7.16 \mathrm{~Hz}, 1 \mathrm{H}), 5.13(\mathrm{~d}, J=$ $14.88 \mathrm{~Hz}, 1 \mathrm{H}), 4.42(\mathrm{~d}, J=14.92 \mathrm{~Hz}, 1 \mathrm{H}), 4.20-4.10(\mathrm{~m}, 1 \mathrm{H}), 4.10-$ $4.00(\mathrm{~m}, 1 \mathrm{H}), 4.00-3.90(\mathrm{~m}, 1 \mathrm{H}), 3.90-3.80(\mathrm{~m}, 2 \mathrm{H}), 3.16($ brs, 1 H$)$, 2.34-2.30 (m, 2H). ${ }^{13} \mathrm{C}$ NMR ( $100 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta 170.3,165.3$, 134.9, 134.1, 130.0, 129.2, 128.8, 128.4, 128.4, 128.2, 71.2, 68.9, 59.1, 58.3, 46.1, 41.0, 39.9. HRMS (ESI-TOF) $\mathrm{m} / \mathrm{z}[\mathrm{M}+\mathrm{Na}]^{+}$calcd for $\mathrm{C}_{21} \mathrm{H}_{21} \mathrm{Cl}_{2} \mathrm{NNaO}_{4} 444.0745$, found 444.0749.
$N$-Butyl- $N$-chlorobutan-1-amine (43) and $N$-Benzylbutan-1amine (44). The known compound $\mathbf{4 2}^{40}$ was transformed into compounds 43 and 44 . The NMR, IR, and HRMS data of 43 and 44 were identical to those reported in the literature. ${ }^{41,42}$ Compound 43 ( $102 \mathrm{mg}, 65 \%$ ): Colorless oil, $R_{\mathrm{f}}=0.7$ (petroleum ether). IR ( KBr ): 2958, 2872, 1466, 1379, $1070 \mathrm{~cm}^{-1} .{ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta$ $2.93(\mathrm{t}, J=7.16 \mathrm{~Hz}, 4 \mathrm{H}), 1.70-1.60(\mathrm{~m}, 4 \mathrm{H}), 1.45-1.30(\mathrm{~m}, 4 \mathrm{H}), 0.95$ $(\mathrm{t}, J=7.36 \mathrm{~Hz}, 6 \mathrm{H}) .{ }^{13} \mathrm{C} \operatorname{NMR}\left(100 \mathrm{MHz}, \mathrm{CDCl}_{3}\right): \delta 64.1,30.0,20.0$, 13.9. HRMS (ESI-TOF) $\mathrm{m} / \mathrm{z}[\mathrm{M}+\mathrm{Na}]^{+}$calcd for $\mathrm{C}_{8} \mathrm{H}_{18} \mathrm{ClNNa}$ 186.1025, found 186.1026. Compound 44 ( $57 \mathrm{mg}, 35 \%$ ): Colorless oil, $R_{\mathrm{f}}=0.3$ (petroleum ether/EtOAc 1:1). IR (KBr): $3419,3074 \mathrm{~cm}^{-1} .{ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta 7.40-7.25(\mathrm{~m}, 5 \mathrm{H}), 3.83(\mathrm{~s}, 2 \mathrm{H}), 3.48$ (brs, $1 \mathrm{H}), 2.66(\mathrm{t}, J=6.84 \mathrm{~Hz}, 2 \mathrm{H}), 1.60-1.40(\mathrm{~m}, 2 \mathrm{H}), 1.40-1.25(\mathrm{~m}, 2 \mathrm{H})$, $0.93(\mathrm{t}, J=7.12 \mathrm{~Hz}, 3 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( $100 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta 139.1,128.5$, 127.2, 53.6, 48.7, 31.6, 20.4, 14.0. HRMS (ESI-TOF) $m / z[\mathrm{M}+\mathrm{Na}]^{+}$ calcd for $\mathrm{C}_{11} \mathrm{H}_{17} \mathrm{NNa}$ 186.1259, found 186.1261 .

Methyl 2-Oxo-2-phenylacetate (51). The known compound $50^{43}$ was transformed into the known compound $51^{44}$ according to the general procedure above. Compound $51(139 \mathrm{mg}, 85 \%)$ : Yellow oil, $R_{\mathrm{f}}=$ 0.3 (petroleum ether/EtOAc 30:1). IR (KBr): 1741, $1692 \mathrm{~cm}^{-1} .{ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta 8.04(\mathrm{~d}, J=8.48 \mathrm{~Hz}, 2 \mathrm{H}), 7.71-7.67(\mathrm{~m}$, $1 \mathrm{H}), 7.56-7.52(\mathrm{~m}, 2 \mathrm{H}), 4.00(\mathrm{~s}, 3 \mathrm{H}) .{ }^{13} \mathrm{C} \mathrm{NMR}\left(100 \mathrm{MHz}, \mathrm{CDCl}_{3}\right): \delta$ 186.1, 164.1, 135.0, 132.4, 130.1, 128.9, 52.8. HRMS (ESI-TOF) $\mathrm{m} / \mathrm{z}$ $[\mathrm{M}+\mathrm{Na}]^{+}$calcd for $\mathrm{C}_{9} \mathrm{H}_{8} \mathrm{NaO}_{3}$ 187.0371, found 187.0373.

(11) The epoxy ring opening was promoted by $m$-CBA. No 20 or 21 were formed when the $m$-CBA in the reaction system was removed using basic alumina.
(12) No diastereomers were formed during epoxide ring opening. The epoxide ring opening was proposed to proceed by an $\mathrm{S}_{\mathrm{N}} 2$-type mechanism. For a related discussion, see ref 9 .
