(*E*)-4-Methoxymethoxy-3-methylbut-3-en-2-one **17b** reacts with NBS in propan-1-ol in a highly regio- and *anti*-stereo-selective manner to give  $(3R^*, 4R^*)$ -3-bromo-4-methoxymethoxy-3-methyl-4-propoxybutan-2-one **18**. Compound **10**, a relative of the butenone **17b** in which the methoxymethoxy group is replaced by the 2,3,4,6-tetra-*O*-acetyl- $\beta$ -D-glucopyranosyl unit, undergoes an analogous bromo(propoxylation) reaction with reasonable facial selectivity to give an 86:14 mixture of (3R, 4R)-3-bromo-3-methyl-4-propoxy-4-(2', 3', 4', 6'-tetra-*O*-acetyl- $\beta$ -D-glucopyranosyloxy)butan-2-one **11c** and its (3S, 4S)-diastereomer **12c**. The major bromo(propoxy) derivative, isolable in 57% yield by fractional crystallisation, is assigned the stereostructure **11c** by single-crystal X-ray crystallographic analysis. Other primary alcohols and methanol participate in the reaction of compound **10** with NBS, leading predominantly (with selectivities ranging from 75:25 to 89:11) to bromo(alkoxy) products of type **11** which are usually separable from their diastereomers of type **12** by fractional crystallisation (in yields ranging from 41 to 64%). A model to account for the role of the 2,3,4,6-tetra-*O*-acetyl- $\beta$ -D-glucopyranosyl unit in the stereoinduction process is proposed.

Related bromo(propoxylation)s are observed with the vinylogous esters **24**, **25a** and **25b**, leading to the isolation of the major products, **28**, **30a** and **30b** (in yields ranging from 39 to 55%), and with the vinylogous carbonates **32a**, **32c**, **37a** and **37b**, providing access to the major products **33a**, **33c**, **38a** and **38b** (in yields ranging from 52 to 73%).

In the presence of trifluoroacetic acid and ethane-1,2-diol, the bromo(propoxy) derivatives **11c**, **28**, **30b** and **33c** undergo transacetalisation to give the ethylene glycol acetals **40a**, **40b**, **41** and **40c** with ees of 94–98%, in yields ranging from 56 to 67%.

# Introduction

As part of a programme aimed at defining, understanding and exploiting stereocommunication through glycosidic bonds,<sup>2</sup> we have become interested in additions to the olefinic bonds of  $\alpha$ -(2,3,4,6-tetra-*O*-acetyl- $\beta$ -D-glucopyranosyloxymethylene) carbonyl compounds of type **1**.<sup>3</sup> In catalytic hydrogenations,<sup>4</sup> dihydro adducts of type **2** have been shown to predominate over those of type **3** (Scheme 1). Although the selectivities were

modest (ranging from 67:33 to 85:15), it was usually possible to isolate the major dihydro derivatives of type **2** in acceptable yields (ranging from 49 to 71%) simply by fractional crystallisation.

 $\ddagger$  The stereodescriptor refers to the carbon atom of the olefin bearing the 2,3,4,6-tetra-O-acetyl- $\beta$ -D-glucopyranosyloxy unit.

In this paper, we report on the behaviour of systems of type **1** in bromo(alkoxylation)s. At the outset of our studies, very little was known about such reactions involving achiral relatives of our substrates.§ On the assumption that their vinyl ether character would outweigh their  $\alpha$ , $\beta$ -unsaturated carbonyl character,¶ systems of type **1** were expected to react in a regioselective manner (the bromine atom being attached to the oxygen-free olefinic carbon atom). If *anti*-stereoselectivity prevailed, bromo(alkoxy) derivatives of type **6** were predicted to predominate over those of type **7**. Conversely, if *syn*-stereoselectivity was dominant, products of type **8** were anticipated in preference to ones of type **9**.

# **Results and discussion**

The butenone 10<sup>4</sup> was selected for the initial bromo(alkoxylation) studies. It reacted with NBS in methanol to give, following a standard work-up (in which the residue, obtained after evaporation of the alcohol, was dissolved in CH<sub>2</sub>Cl<sub>2</sub> and the solution was washed with aq. Na<sub>2</sub>S<sub>2</sub>O<sub>5</sub> and then concentrated), mainly a 75:25 mixture of bromo(methoxy) derivatives. Two crystallisations of the mixture provided the major product in 47% yield; by processing the mother liquor, it was possible to isolate the minor product (contaminated with  $\approx 5\%$  of the major adduct) in  $\approx 10\%$  yield. There was little doubt that the products possessed the expected regiostructures; thus, the methine hydrogen atoms at position 4 resonated as singlets at  $\delta$  4.95 (for the major adduct) and  $\delta$  5.03, in accord with their acetal disposition. On the basis of subsequent evidence, the major material was assigned the stereostructure 11a and the minor one the stereostructure 12a, indicative of anti-stereoselective additions (Scheme 2).

Me Me 0 .Me NBS Br Me ROH RO Me H) RO ÓR' ÓR' ÓR' 11 12 10 a R = Me  $\mathbf{b} \mathbf{R} = \mathbf{E}\mathbf{t}$ d R = Buc R = Pre R = Bn  $f R = CH_2CHMe_2$ g R = CH<sub>2</sub>CMe<sub>3</sub> Scheme 2

With a view to improving the selectivity and/or the isolated yield of the major bromo(alkoxy) derivative, the reaction of the butenone **10** with NBS and other alcohols was examined (Scheme 2).

The use of ethanol led to the isolation of an 80:20 mixture of the bromo(ethoxy) derivatives **11b** and **12b** after the standard work-up; two crystallisations provided compound **11b** in 38% yield. A more efficient route to compound **11b** became available when it was discovered that the material was relatively insoluble in the reaction mixture; a simple filtration of the cooled mixture then afforded compound **11b** in 64% yield.

An 86:14 mixture of the bromo(propoxy) products **11c** and **12c** was produced in the reaction of the butenone **10** with NBS

$$A \qquad \bigcup_{Br} C \qquad \bigcup_{C} O-C \\ H \\ C \qquad \bigcup_{C} O-C \\ O-C \\$$

¶ A referee has asked for the basis of this assumption. It rests on the knowledge that the reactivity of alkenes towards electrophiles is increased by electron-donating substituents and decreased by electron-withdrawing substituents. Electrophiles, therefore, would be expected to be more responsive to electron-rich character than to electron-deficient character.

and propan-1-ol; the standard work-up followed by two crystallisations gave the major material **11c** in 57% yield. A simpler work-up (in which the reaction mixture was partially concentrated, cooled and filtered) provided compound **11c** in 52% yield.

The reaction of the butenone **10** with NBS and butan-1-ol gave rise to an 86:14 of the bromo(butoxy) derivatives **11d** and **12d**, from which the major product **11d** was isolated in 41% yield after crystallisation.

When the butenone **10** was subjected to the action of NBS and propan-2-ol or 2-methylpropan-2-ol, the tetraacetate **13** (as a mixture of  $\alpha$ - and  $\beta$ -anomers) was the major product. In the former reaction, there was also evidence for the presence of  $\approx 25\%$  of two dibromo products of type **14** (as an 80:20

mixture) on the basis of the presence of singlets at  $\delta$  6.35 and 6.50 (attributed to the 4-H methine signals of the minor and major dibromides).

To determine the effect of  $\alpha$ -substitution, benzyl alcohol, 2-methylpropan-1-ol and 2,2-dimethylpropan-1-ol were examined in the reaction of the butenone **10** with NBS. Benzyl alcohol provided an 89:11 mixture of the bromo(benzyloxy) derivatives **11e** and **12e**, from which compound **11e** was isolated in 43% yield after crystallisation. 2-Methylpropan-1-ol gave an 88:12 mixture of the bromo(methylpropoxy) products **11f** and **12f**; fractional crystallisation of the mixture led to the isolation of compound **11f** in 55% yield. Mainly three products arose in the reaction with 2,2-dimethylpropan-1-ol, considered to be a 76:10:14 mixture of compounds **11g**, **12g** and **14** by <sup>1</sup>H NMR spectroscopy; fractional crystallisation gave a 91:9 mixture of compounds **11g** and **14**.

From the foregoing results, it is clear that methanol and a range of primary alcohols participate in the reaction of the butenone **10** with NBS. Major and minor bromo(alkoxy) derivatives of types **11** and **12** emerge in ratios ranging from 75:25 to 89:11; the major products of type **11** can be isolated by fractional crystallisation in yields ranging from 41 to 64%.

The major product obtained from the reaction of the butenone **10** with NBS and propan-1-ol was assigned the stereostructure **11c** on the basis of a single-crystal X-ray crystallographic analysis. Its molecular structure, together with its crystallographic labelling, is shown in Fig. 1.|| The stereostructures **11a**,**b** and **11d**–**g** were inferred by analogy and supported by similarities in the <sup>1</sup>H NMR spectra of the compounds. Thus, the methyl ketone signals appeared in the  $\delta$  2.20–2.32 region for compounds **11a**–**g**; by contrast the corresponding signals for their diastereomers **12a**–**g** were shifted downfield by 0.05–0.13 ppm.

Although there was no doubt that compounds 11a-g were the major products of the bromo(alkoxylation)s of the butenone 10, the structures of the minor products were not unequivocally defined. As indicated in Scheme 3, if the oxonium ion 15 were to intervene, then the minor products could possess the stereostructures 16a-g. To shed light on this situation, the behaviour of compound 17b (prepared in 35% yield after chromatography by the action of ClCH<sub>2</sub>OMe on the salt 17a<sup>6</sup> in MeCN) in the bromo(propoxylation) was examined. The formation of a single

<sup>§</sup> A sub-structure search in STN International and Beilstein Crossfire of the unit A shown below failed to provide any relevant references.

<sup>||</sup> In compound **11c**, the torsional angles involving O(5')-C(1')-O(1')-C(4), C(1')-O(1')-C(4)-O(4) and O(1')-C(4)-O(4)-C(6) are -76.2, +121.2 and  $-86.7^{\circ}$ . For two other crystal structures of glycosidic acyclic acetals, see ref. 10.

The reactions of the butenone **21** with NBS in ethanol, propan-1-ol and benzyl alcohol were examined (Scheme 5). The

first reaction afforded a 71:29 mixture of the bromo(ethoxy) derivatives 22a and 23a, the second a 72:28 mixture of the bromo(propoxy) products 22b and 23b, and the third an 80:20 mixture of the bromo(benzyloxy) derivatives 22c and 23c. In each case, the product was contaminated with a significant amount (10-25%) of the tetraacetate 13, necessitating a chromatographic purification. However, fractional crystallisation of the purified products failed to provide the major bromo(alkoxy) material free of the minor one. The stereostructures of compounds 22a-c and 23a-c were not rigorously established but were assigned by analogy with the results observed for the butenone 10. It is worth noting, however, that the methyl ketone signals appeared at higher field in the major bromo(alkoxy) products [as was observed in the case of the major bromo(alkoxy) derivatives 11a-g derived from 10]. Clearly, the bromo(alkoxylation)s of the butenone 21 were less *Re*-face selective than those of its relative **10**.

The bromo(propoxylation) reaction could be extended to the pentenone  $24^6$  and compounds  $25a^4$  and  $25b.^4$  Thus, the acyclic

vinylogous ester 24 [prepared from the salt  $26^8$  and the acetobromoglucose  $27^9$  in much improved yield (44% *versus* 6%) by using a mixture of Me<sub>2</sub>CO and water (in place of Me<sub>2</sub>SO) as the reaction medium \*\*] gave rise to the bromo(propoxy) derivatives 28 and 29 (Scheme 6) in the ratio 87:13; compound 28 was

isolated in 51% yield after the standard work-up and crystallisation (the yield was increased to 55% by simply cooling the reaction mixture, filtering off the product and effecting its recrystallisation). The reactions involving the methylenecyclopentanone **25a** and the methylenecyclohexanone **25b** (Scheme 7) afforded 87:13 mixtures of the bromo(propoxy) adducts **30a/31a** and **30b/31b**; following crystallisation, compound **30a** was isolated in 52% yield and compound **30b** in 39% yield.

As Schemes 8 and 9 illustrate, vinylogous carbonates also underwent the bromo(propoxylation). Thus, the propenoate

J. Chem. Soc., Perkin Trans. 1, 2000, 2195–2204 2197

Fig. 1 Molecular structure of compound 11c.

bromo(propoxy) derivative, isolated in 57% yield after chromatography and assigned the structure *rac*-18, implied that the addition displayed high *anti*-stereoselectivity. It is likely, therefore, that the minor products formed in the bromo(alkoxylation)s of the butenone 10 possess the stereostructures 12a–g, rather than the stereostructures 16a–g, and that they arise by  $S_N$ 2-like ring openings of the cyclic bromonium ion 20. Correspondingly, the major bromo(alkoxylation) products are deemed to arise from the cyclic bromonium ion 19 by similar pathways (Scheme 4). It is worth noting that the preferred

bromonium ion **19** is that resulting from a selective addition to the *Re*-face of the olefinic bond of compound **10** and consistent with the involvement of a reactive conformation akin to **4** ( $\mathbf{R}^1 = \mathbf{R}^2 = \mathbf{M}\mathbf{e}$ ).

<sup>\*\*</sup> Earlier, a similar modification was shown to result in an improvement in the yield of the butenone **10** (see ref. 4).

32a<sup>4</sup> furnished an 85:15 mixture of the bromo(propoxy) derivatives 33a and 34a; crystallisation of the mixture provided compound 33a in 52% yield. A 78:22 mixture of the bromo-(propoxy) derivatives 33b and 34b was produced in the reaction involving the propenoate 32b [prepared (73% yield after crystallisation) by Wittig condensation of the formyl ester 35<sup>6</sup> with the phosphorane 36], from which compound 33b was isolated in 18% yield after chromatography and crystallisation. Again, it is worth noting that replacement of the 2-methyl group by a hydrogen atom results in a poorer Re-face selectivity. Whilst the propenoate  $32c^4$  showed a selectivity identical to that of its relative 32a, it was possible to isolate the major bromo-(propoxy) derivative 33c in a much better yield (73% after crystallisation). The cyclic vinylogous carbonates  $37a^4$  and  $37b^4$ underwent reaction with NBS in propan-1-ol to give similar ratios of products, the former reaction affording an 85:15 mixture of the bromo(propoxy) derivatives 38a and 39a and the latter a 90:10 mixture of compounds 38b and 39b. Following crystallisation, compound 38a was isolated in 54% yield and compound 38b in 66% yield.

To summarise, a range of acyclic and cyclic vinylogous esters/ carbonates of type **1** react with NBS and methanol/primary alcohols to give predominantly bromo(alkoxy) products of type **6**, which can usually be isolated in a near-stereopure state by fractional crystallisation.

Removal of the auxiliary from bromo(alkoxy) derivatives of type **6** was readily achieved under transacetalisation conditions. Thus, when treated with trifluoroacetic acid (TFA) and ethane-1,2-diol, the bromo(propoxy) derivative **11c** was transformed into mainly a 50:50 mixture of the acetal **40a** and the tetraacetate **13**; a simple work-up [in which the mixture was left in acidic methanol (to convert **13** into D-glucose)] gave the acetal **40a**, as a near-pure oil (by <sup>1</sup>H NMR spectroscopy) in 63% yield. A chromatographed sample possessed an ee of 98%.

In a similar manner, the bromo(propoxy) derivatives **28**, **30b** and **33c** were transformed into the acetals **40b** (58% yield; 94% ee), **41** (56% yield; 96% ee) and **40c** (67% yield; 98% ee).

The aforecited results are of interest in the following respects. In showing that vinylogous esters/carbonates of type 1 undergo highly regioselective bromo(alkoxylation)s in an *anti*-stereo-selective manner, they illuminate new reactivity of these synthetically versatile systems. They reveal that the model used to explain the facial reactivity of systems of type 1 in hydrogenations also accounts for their behaviour in bromo(alkoxyl-ation)s. They extend the role of the 2,3,4,6-tetra-*O*-acetyl- $\beta$ -D-glucopyranosyl unit as a cheap and practical auxiliary. Finally, compounds 11c, 28, 30a,b, 33c, 38a,b, 40a–c and 41 are representatives of a new class of 1,2,3-trifunctional chirons and the present technology is capable of making them available in gram quantities. Their clusters of reactive functionality render the compounds of considerable potential in stereoselective synthesis.

# Experimental

Light petroleum refers to that fraction boiling in the range 35-60 °C. NBS was recrystallised from ten times its weight of water, dried *in vacuo* (over P<sub>2</sub>O<sub>5</sub>) and stored in the dark.

The progress of reactions was monitored by TLC, using Merck plastic or aluminium sheets coated with silica gel (60  $F_{254}$ ); chromatograms were initially examined under UV light (Mineralight UVG2-58) and then visualised with a *p*-anisaldehyde stain [plates were sprayed with *p*-MeOC<sub>6</sub>H<sub>4</sub>-CHO–conc. H<sub>2</sub>SO<sub>4</sub>–EtOH (1:4:95) and heated]. Column chromatography was effected, under positive pressure from a compressed-air line, with Crossfield Sorbsil C60 flash silica. HPLC analyses were carried out with a Chiralpak AD column (25 × 0.46 cm) employing either a Kontron system [420 pump and 742 UV detector (set at 215 nm)] fitted with a Rheodyne 7125 injector or a Shimadzu system (LC-10AT pump, SPD-10AV UV/vis detector, SIL-10AD autoinjector and SCL-10A controller).

Evaporations were conducted under reduced pressure (using a water-pump or an oil-pump) at  $\leq 40$  °C with a Büchi rotary evaporator (fitted with a water or Me<sub>2</sub>CO–solid CO<sub>2</sub> condenser). Mps were determined with a Büchi 512 melting point apparatus. Specific optical rotations, given in 10<sup>-1</sup> deg cm<sup>2</sup> g<sup>-1</sup>, were measured at  $\approx 20$  °C using a Thorn Automation Type 243 or an Optical Activity 1000 polarimeter with a cell of path length 0.1 dm.

Carbon, hydrogen and nitrogen contents were determined with a Carlo Erba Model 1108 analyser; bromine content was measured by oxygen combustion followed by automatic argentometric titration on a Mettler DL25 titrator. A Perkin-Elmer Lambda 15 spectrometer was used to determine UV spectra; extinction coefficients ( $\varepsilon$ ) are presented in cm<sup>2</sup> mmol<sup>-1</sup>. IR spectra were recorded using a Perkin-Elmer 783 spectrometer. NMR spectra were measured using a Bruker AM 300 or a Bruker AM 400 [with distortionless enhancement by polarisation transfer (DEPT) editing for <sup>13</sup>C spectra]; *J*-values and separations are given in Hz. FAB mass spectra (m-NO<sub>2</sub>C<sub>6</sub>H<sub>4</sub>-CH<sub>2</sub>OH as matrix) and CI mass spectra (NH<sub>3</sub> as carrier gas) were measured using a Kratos MS 50 spectrometer; high-

# (E)-4-Methoxymethoxy-3-methylbut-3-en-2-one 17b

Chloromethyl methyl ether (2.00 g, 24.8 mmol) was added to a stirred mixture of the sodium salt 17a<sup>6</sup> (2.44 g, 20.0 mmol) and acetonitrile (20 cm<sup>3</sup>). After 15 h, the mixture was concentrated and the product partitioned between dichloromethane and water. Evaporation of the dried (MgSO<sub>4</sub>) organic phase left a syrup that was predominantly compound 17b. Subjection of the material to column chromatography [hexanes-EtOAc (4:1) as eluent] gave the *title compound* **17b** (1.01 g, 35%);  $\lambda_{max}$  (EtOH)/ nm 249 (ε 10000); v<sub>max</sub> (film)/cm<sup>-1</sup> 1720 (vinylogous ester C=O) and 1650 (C=C);  $\delta_{\rm H}$  (300 MHz; CDCl<sub>3</sub>) 1.73 (3 H, d, J 1, 3-Me), 2.22 (3 H, s, 1-H<sub>3</sub>), 3.44 (3 H, s, MeO), 5.00 (2 H, s, OCH<sub>2</sub>O) and 7.41 (1 H, apparent d, separation 1, 4-H);  $\delta_{\rm C}$  (100 MHz; CDCl<sub>3</sub>) 8.3 (CH<sub>3</sub>C), 25.3 (1-CH<sub>3</sub>), 56.3 (CH<sub>3</sub>O), 97.4 (OCH<sub>2</sub>O), 119.5 (3-C), 156.1 (4-CH) and 197.7 (2-CO); m/z (CI) 145 (MH<sup>+</sup>, 100%) (Found: MH<sup>+</sup>, 145.0867. C<sub>7</sub>H<sub>13</sub>O<sub>3</sub> requires *m*/*z* 145.0865).

# (*E*)-2-Methyl-1-(2',3',4',6'-tetra-*O*-acetyl-β-D-gluocopyranosyloxy)pent-1-en-3-one 24

A solution of the salt **26**<sup>8</sup> (6.80 g, 50 mmol) in water (20 cm<sup>3</sup>) and the acetobromoglucose **27**<sup>9</sup> (10.3 g, 25 mmol) in acetone (40 cm<sup>3</sup>) was stirred for 3 days. After partial concentration (to remove Me<sub>2</sub>CO), the mixture was extracted twice with dichloromethane. Evaporation of the dried (MgSO<sub>4</sub>) organic phase and crystallisation of the residue from dichloromethane–diethyl ether gave compound **24** (4.91 g, 44%) in a pure state; mp 107–108 °C (lit.,<sup>6</sup> 97–99 °C);  $\delta_{\rm H}$  (300 MHz; CDCl<sub>3</sub>) 1.10 (3 H, t, *J* 7, 5-H<sub>3</sub>), 1.72 (3 H, d, *J* 1, 2-Me), 2.03, 2.05, 2.06 and 2.09 (each 3 H, s, 4 × MeCO<sub>2</sub>), 2.56 (2 H, q, *J* 7, 4-H<sub>2</sub>), 3.83 (1 H, ddd, *J* 2.5, 5 and 10, 5'-H), 4.16 and 4.30 [each 1 H, dd (*J* 2.5 and 12.5) and dd (*J* 5 and 12.5), 6'-H<sub>2</sub>], 4.90 (1 H, d, *J* 8, 1'-H), 5.13–5.30 (3 H, m, 2'-, 3' and 4'-H) and 7.36 (1 H, apparent d, separation 1, 1-H).

# Methyl (*E*)-3-(2',3',4',6'-tetra-*O*-acetyl-β-D-glucopyranosyloxy)prop-2-enoate 32b

A solution of the formyl ester  $35^6$  (4.00 g, 10.6 mmol) and the phosphorane 36 [obtained by washing a solution of Bu<sub>3</sub>P<sup>+</sup>CH<sub>2</sub>- $CO_2Me Br^-$  (5.10 g, 14.4 mmol) in  $CH_2Cl_2$  with 10% aq. NaOH and removing the solvent by evaporation] in toluene (100 cm<sup>3</sup>) was heated under reflux for 30 min. The solid, obtained after concentration, was washed with light petroleum and the product crystallised from dichloromethane-light petroleum to give the title compound 32b (3.34 g, 73%); mp 142-143 °C; [a]<sub>D</sub> -21 (c 0.27, CH<sub>2</sub>Cl<sub>2</sub>) (Found: C, 49.7; H, 5.6.  $C_{18}H_{24}O_{12}$  requires C, 50.0; H, 5.6%);  $\lambda_{max}$  (EtOH)/nm 223 ( $\varepsilon$  16000);  $v_{max}$  (KBr)/cm<sup>-1</sup> 1750 (ester C=O), 1720 and 1710 (vinylogous carbonate C=O), and 1630 (C=C);  $\delta_{\rm H}$  (300 MHz; CDCl<sub>3</sub>) 2.04, 2.06, 2.07 and 2.12 (each 3 H, s, 4 × MeCO<sub>2</sub>), 3.73 (3 H, s, MeO<sub>2</sub>C), 3.83 (1 H, ddd, J 2.5, 5 and 10, 5'-H), 4.17 and 4.29 [each 1 H, dd (J 2.5 and 12.5) and dd (J 5 and 12.5), 6'-H<sub>2</sub>], 4.92 (1 H, d, J 8, 1'-H), 5.14 (1 H, t, J 9.5, 4'-H), 5.16 (1 H, dd, J 8 and 9, 2'-H), 5.27 (1 H, t, J 9, 3'-H), 5.51 (1 H, d, J 12.5, 2-H) and 7.52 (1 H, d, J 12.5, 3-H); δ<sub>C</sub> (100 MHz; CDCl<sub>3</sub>) 20.9 and 21.0 (4 × CH<sub>3</sub>CO<sub>2</sub>), 51.7 (CH<sub>3</sub>O), 61.9 (6'-CH<sub>2</sub>), 68.1, 71.0, 72.7 and 73.0 (2'-, 3'-, 4'- and 5'-CH), 100.3 (1'-CH), 102.1 (2-CH), 158.9 (3-CH), 167.6 (CO2Me) and 169.4, 169.6, 170.4 and 170.9 (4 × MeCO); m/z (FAB) 433 (MH<sup>+</sup>, 10%), 331 (C<sub>14</sub>H<sub>19</sub>O<sub>9</sub><sup>+</sup>, 45), 169 (70), 109 (55) and 43 (100) [(after addition of KI) 471 (MK<sup>+</sup>, 40%)].

### Bromo(alkoxylation) studies

General procedure. NBS (0.214 g, 1.2 mmol) was added to a stirred mixture of the vinylogous ester/carbonate (1 mmol) in the

appropriate alcohol. After the time specified, the mixture was concentrated and a solution of the residue in ethyl acetate or dichloromethane was washed successively with 1% aq. sodium metabisulfite and water. Evaporation of the dried (MgSO<sub>4</sub>) organic phase gave a residue, which was analysed by NMR spectroscopy and then purified in the manner described.

Reaction involving the butenone 10 and methanol. The reaction of the butenone 10<sup>4</sup> (0.225 g, 0.52 mmol) in methanol (5 cm<sup>3</sup>) for 1 h gave rise to a product comprising mainly a 75:25 mixture of the bromo(methoxy) adducts 11a and 12a [the ratio was estimated from the integrals of the singlets at  $\delta$  2.32 and 2.38 (attributed to the 1-H<sub>3</sub> signals of 11a and 12a) and of the singlets at  $\delta$  3.46 and 3.59 (ascribed to the methoxy signals of 11a and 12a)];  $\approx$ 5% of succinimide ( $\delta$  2.72) was also present.

Crystallisation of the material from dichloromethane–diethyl ether-light petroleum gave a 96:4 mixture of the bromo-(methoxy) adducts 11a and 12a (0.153 g, 54%). A further crystallisation from methanol provided (3R,4R)-3-bromo-4methoxy-3-methyl-4-(2',3',4',6'-tetra-O-acetyl-β-D-glucopyranosyloxy)butan-2-one 11a (0.133 g, 47%); mp 150-152 °C; [a]<sub>D</sub> -20 (c 2.0, CH<sub>2</sub>Cl<sub>2</sub>) (Found: C, 44.5; H, 5.4; Br, 15.3.  $C_{20}H_{29}BrO_{12}$  requires C, 44.4; H, 5.4; Br, 14.8%);  $\lambda_{max}$  (EtOH)/ nm 294 ( $\epsilon$  85);  $\nu_{max}$  (KBr)/cm<sup>-1</sup> 1750 (ester C=O) and 1725 (ketone C=O);  $\delta_{\rm H}$  (300 MHz; CDCl<sub>3</sub>) 1.78 (3 H, s, 3-Me), 2.02, 2.05, 2.06 and 2.08 (each 3 H, s, 4 × MeCO<sub>2</sub>), 2.32 (3 H, s, 1-H<sub>3</sub>), 3.46 (3 H, s, MeO), 3.79 (1 H, ddd, J 2.5, 5 and 10, 5'-H), 4.18 and 4.25 [each 1 H, dd (J 5 and 12) and dd (J 2.5 and 12), 6'-H<sub>2</sub>], 4.83 (1 H, d, J 8, 1'-H), 4.95 (1 H, s, 4-H), 5.08 (1 H, t, J 9.5, 4'-H), 5.13 (1 H, dd, J 8 and 9.5, 2'-H) and 5.28 (1 H, t, J 9.5, 3'-H); δ<sub>c</sub> (100 MHz; CDCl<sub>3</sub>) 19.3 (CH<sub>3</sub>C), 20.7, 20.8, 21.0 and 21.2 (4 × CH<sub>3</sub>CO<sub>2</sub>), 24.9 (1-CH<sub>3</sub>), 57.4 (CH<sub>3</sub>O), 62.1 (6'-CH<sub>2</sub>), 66.4 (3-C), 68.6, 71.1, 72.1 and 72.6 (2'-, 3'-, 4'- and 5'-CH), 100.8 (1'-CH), 106.4 (4-CH), 169.4, 169.5, 170.3 and 170.5 (4 × MeCO) and 200.2 (2-CO); m/z (FAB) 331 (C<sub>14</sub>H<sub>19</sub>O<sub>9</sub><sup>+</sup>, 80%), 195 and 193 (C<sub>6</sub>H<sub>10</sub>BrO<sub>2</sub><sup>+</sup>, each 15), and 169 (100).

The filtrate from the first crystallisation was concentrated and the residue was triturated with light petroleum to give mainly (3*S*,4*S*)-3-bromo-4-methoxy-3-methyl-4-(2',3',4',6'tetra-*O*-acetyl- $\beta$ -D-glucopyranosyloxy)butan-2-one **12a** (0.028 g,  $\approx$ 10%);  $\delta_{\rm H}$ (300 MHz; CDCl<sub>3</sub>) *inter alia* 1.77 (3 H, s, 3-Me), 2.01, 2.03, 2.05 and 2.08 (each 3 H, s, 4 × MeCO<sub>2</sub>), 2.38 (3 H, s, 1-H<sub>3</sub>), 3.59 (3 H, s, MeO), 3.73 (1 H, ddd, *J* 2.5, 5 and 10, 5'-H), 4.15 and 4.24 [each 1 H, dd (*J* 2.5 and 12.5) and dd (*J* 5 and 12.5), 6'-H<sub>2</sub>], 4.83 (1 H, dd, *J* 8, 1'-H), 5.03 (1 H, s, 4-H), 5.08 (1 H, d, *J* 8 and 9.5, 2'-H), 5.09 (1 H, t, *J* 9.5, 4'-H) and 5.24 (1 H, t, *J* 9.5, 3'-H).

Reaction involving the butenone 10 and ethanol. (a) The reaction of the butenone 10 (0.225 g, 0.52 mmol) in ethanol (5 cm<sup>3</sup>) for 1 h gave rise to a product comprising mainly an 80:20 mixture of the bromo(ethoxy) adducts 11b and 12b [the ratio was estimated from the heights of the singlets at  $\delta$  2.32 and 2.39 (ascribed to the 1-H<sub>3</sub> signals of 11b and 12b)];  $\approx 8\%$  of succinimide was also present.

Two crystallisations of the mixture from chloroform–diethyl ether–light petroleum gave (3R,4R)-3-bromo-4-ethoxy-3methyl-4-(2',3',4',6'-tetra-O-acetyl- $\beta$ -D-glucopyranosyloxy)butan-2-one **11b** (0.110 g, 38%); mp 152–153 °C;  $[a]_D$  –29 (c 0.53, CH<sub>2</sub>Cl<sub>2</sub>) (Found: C, 45.1; H, 5.5; Br, 14.5. C<sub>21</sub>H<sub>31</sub>BrO<sub>12</sub> requires C, 45.4; H, 5.6; Br, 14.4%);  $\lambda_{max}$  (EtOH)/nm 293 ( $\epsilon$  90);  $\nu_{max}$  (KBr)/cm<sup>-1</sup> 1760 (ester C=O) and 1730 (ketone C=O);  $\delta_H$  (300 MHz; CDCl<sub>3</sub>) 1.11 (3 H, t, J 7, MeCH<sub>2</sub>), 1.78 (3 H, s, 3-Me), 2.02, 2.04, 2.06 and 2.08 (each 3 H, s, 4 × MeCO<sub>2</sub>), 2.32 (3 H, s, 1-H<sub>3</sub>), 3.49 and 3.94 (each 1 H, dq, J 9.5 and 7, MeCH<sub>2</sub>O), 3.77 (1 H, ddd, J 2.5, 5.5 and 10, 5'-H), 4.16 and 4.24 [each 1 H, dd (J 5.5 and 12) and dd (J 2.5 and 12), 6'-H<sub>2</sub>], 4.84 (1 H, d, J 8, 1'-H), 5.05 (1 H, s, 4-H), 5.06 (1 H, t, J 9.5, 4'-H), 5.12 (1 H, dd, J 8 and 9.5, 2'-H) and 5.27 (1 H, t, J 9.5, 3'-H);  $\delta_C$  (100 MHz; CDCl<sub>3</sub>) 14.8 (CH<sub>3</sub>CH<sub>2</sub>), 19.5 (CH<sub>3</sub>C), 20.7, 20.8 and 21.1 (4 × CH<sub>3</sub>CO<sub>2</sub>), 25.0 (1-CH<sub>3</sub>), 62.2 (6'-CH<sub>2</sub>), 65.5 (MeCH<sub>2</sub>), 66.8 (3-C), 68.6, 71.2, 72.1 and 72.6 (2'-, 3'-, 4'- and 5'-CH), 100.8 (1'-CH), 104.9 (4-CH), 169.4, 169.6, 170.3 and 170.5 (4 × MeCO) and 200.2 (2-CO); m/z (FAB) 331 (C<sub>14</sub>H<sub>19</sub>O<sub>9</sub><sup>+</sup>, 80%), 209 and 207 (C<sub>7</sub>H<sub>12</sub>BrO<sub>2</sub><sup>+</sup>, each 50), and 169 (100).

(b) The reaction of the butenone **10** (4.30 g, 10.0 mmol) in ethanol (50 cm<sup>3</sup>) for 15 h deposited a solid. The mixture was cooled (-30 °C) and the solid collected by filtration. After having been washed with a small volume of cold ethanol and dried, the solid (3.57 g, 64%) was identified as the bromo(ethoxy) adduct **11b**.

Reaction involving the butenone 10 and propan-1-ol. (a) The reaction of the butenone 10 (2.00 g, 4.7 mmol) in propan-1-ol (40 cm<sup>3</sup>) for 1 h gave rise to a product comprising mainly an 86:14 mixture of the bromo(propoxy) adducts 11c and 12c [the ratio was estimated from the integrals of the singlets at  $\delta$  2.31 and 2.37 (ascribed to the 1-H<sub>3</sub> signals of 11c and 12c)]; ≈10% of succinimide was also present.

Two crystallisations of the mixture from chloroform-diethyl ether-light petroleum gave (3R,4R)-3-bromo-3-methyl-4 $propoxy-4-(2',3',4',6'-tetra-O-acetyl-\beta-D-glucopyranosyloxy)$ butan-2-one 11c (1.51 g, 57%); mp 134–136 °C; [a]<sub>D</sub> –28 (c 1.2, CH2Cl2) (Found: C, 46.3; H, 6.0; Br, 14.1. C22H33BrO12 requires C, 46.4; H, 5.8; Br, 14.0%);  $\lambda_{\rm max}$  (EtOH)/nm 294 ( $\varepsilon$ 90);  $\nu_{\rm max}$ (KBr)/cm<sup>-1</sup> 1760 (ester C=O) and 1730 (ketone C=O);  $\delta_{\rm H}$  (300 MHz; CDCl<sub>3</sub>) 0.82 (3 H, t, J 7.5, MeCH<sub>2</sub>), 1.44–1.56 (2 H, m, MeCH<sub>2</sub>), 1.77 (3 H, s, 3-Me), 2.01, 2.04, 2.06 and 2.07 (each 3 H, s,  $4 \times MeCO_2$ ), 2.31 (3 H, s, 1-H<sub>3</sub>), 3.33 and 3.87 (each 1 H, dt, J 9.5 and 6.5, EtCH<sub>2</sub>O), 3.76 (1 H, ddd, J 2.5, 5 and 10, 5'-H), 4.15 and 4.23 [each 1 H, dd (J 5 and 12) and dd (J 2.5 and 12), 6'-H<sub>2</sub>], 4.84 (1 H, d, J 8, 1'-H), 5.03 (1 H, s, 4-H), 5.06 (1 H, t, J 10, 4'-H), 5.11 (1 H, dd, J 8 and 9.5, 2'-H) and 5.26 (1 H, t, J 9.5, 3'-H);  $\delta_{\rm C}$  (100 MHz; CDCl<sub>3</sub>) 10.2 (CH<sub>3</sub>CH<sub>2</sub>), 19.2 (CH<sub>3</sub>C), 20.4, 20.5 and 20.7 (4 × CH<sub>3</sub>CO<sub>2</sub>), 22.3 (MeCH<sub>2</sub>), 24.7 (1-CH<sub>3</sub>), 61.8 (6'-CH<sub>2</sub>), 66.4 (3-C), 68.3, 70.9, 71.7 and 72.3 (2'-, 3'-, 4'- and 5'-CH), 71.3 (EtCH2), 100.5 (1'-CH), 104.7 (4-CH), 169.1, 169.2, 170.0 and 170.2 (4 × MeCO) and 199.8 (2-CO); m/z (FAB) 331 (C<sub>14</sub>H<sub>19</sub>O<sub>9</sub><sup>+</sup>, 70%), 223 and 221 (C<sub>8</sub>H<sub>14</sub>BrO<sub>2</sub><sup>+</sup>, each 40), 181 and 179 (C<sub>5</sub>H<sub>8</sub>BrO<sub>2</sub><sup>+</sup>, each 20), and 169 (100).

(b) The reaction of the butenone **10** (0.430 g, 1.00 mmol) in propan-1-ol (50 cm<sup>3</sup>) was left for 1 h at 38 °C and 60 h at  $\approx 20$  °C. After concentration to  $\approx 50\%$  of its volume, the mixture was allowed to crystallise (first at  $\approx 20$  °C and then at -30 °C); filtration gave the bromo(propoxy) adduct **11c** (0.298 g, 52%).

Reaction involving the butenone 10 and butan-1-ol.—The reaction of the butenone 10 (0.225 mmol, 0.52 mmol) in butan-1-ol (18 cm<sup>3</sup>) for 1 h gave rise to a product comprising mainly an 86:14 mixture of the bromo(butoxy) adducts 11d and 12d [the ratio was estimated from the integrals of the singlets at  $\delta$  2.32 and 2.39 (ascribed to the 1-H<sub>3</sub> signals of 11d and 12d)].

Crystallisation of the mixture from chloroform-diethyl ether-light petroleum gave (3R,4R)-3-bromo-4-butoxy-3methyl-4-(2',3',4',6'-tetra-O-acetyl-β-D-glucopyranosyloxy)*butan-2-one* **11d** (0.125 g, 41%); mp 75–77 °C; [*a*]<sub>D</sub> –12 (*c* 0.08, CH<sub>2</sub>Cl<sub>2</sub>) (Found: C, 47.4; H, 6.1; Br, 13.8. C<sub>23</sub>H<sub>35</sub>BrO<sub>12</sub> requires C, 47.3; H, 6.0; Br, 13.7%);  $\lambda_{\rm max}$  (EtOH)/nm 294 ( $\varepsilon$  110);  $\nu_{\rm max}$ (KBr)/cm<sup>-1</sup> 1760 (ester C=O) and 1730 (ketone C=O);  $\delta_{\rm H}$  (300 MHz; CDCl<sub>3</sub>) 0.86 (3 H, t, J 7.5, MeCH<sub>2</sub>), 1.19-1.33 and 1.35-1.52 (each 2 H, m, MeCH<sub>2</sub>CH<sub>2</sub>), 1.78 (3 H, s, 3-Me), 2.02, 2.04, 2.06 and 2.08 (each 3 H, s,  $4 \times MeCO_2$ ), 2.32 (3 H, s, 1-H<sub>3</sub>), 3.37 and 3.92 (each 1 H, dt, J 9.5 and 6.5, PrCH<sub>2</sub>O), 3.76 (1 H, ddd, J 3, 5 and 10, 5'-H), 4.16 and 4.23 [each 1 H, dd (J 5 and 12) and dd (J 3 and 12), 6'-H<sub>2</sub>], 4.84 (1 H, d, J 8, 1'-H), 5.03 (1 H, s, 4-H), 5.07 (1 H, t, J 9.5, 4'-H), 5.12 (1 H, dd, J 8 and 9.5, 2'-H) and 5.27 (1 H, t, J 9.5, 3'-H);  $\delta_{\rm C}$  (100 MHz; CDCl<sub>3</sub>) 13.8 (CH<sub>3</sub>CH<sub>2</sub>), 19.2 (MeCH<sub>2</sub>), 19.4 (CH<sub>3</sub>C), 20.7 and 21.0  $(4 \times CH_3CO_2)$ , 25.0 (1-CH<sub>3</sub>), 31.4 (EtCH<sub>2</sub>), 62.1 (6'-CH<sub>2</sub>), 66.7 (3-C), 68.5, 71.1, 72.0 and 72.6 (2'-, 3'-, 4'- and 5'-CH), 69.7 (PrCH<sub>2</sub>), 100.7 (1'-CH), 105.0 (4-CH), 169.4, 169.5, 170.3

and 170.5 ( $4 \times MeCO$ ) and 200.1 (2-CO); m/z (FAB) 331 ( $C_{14}H_{19}O_{9}^{+}$ , 50%), 237 and 235 ( $C_{9}H_{16}BrO_{2}^{+}$ , each 20), 181 and 179 ( $C_{5}H_{8}BrO_{2}^{+}$ , each 15) and 169 (100); m/z (CI) 602 and 600 (MNH<sub>4</sub><sup>+</sup>, 15 and 10%), 331 ( $C_{14}H_{19}O_{9}^{+}$ , 20) and 157 (100).

Reaction involving the butenone 10 and propan-2-ol. The reaction of the butenone 10 (0.215 g, 0.50 mmol) in propan-2-ol (60 cm<sup>3</sup>) for 2 h gave rise to a product comprising mainly the tetraacetylglucose 13 as a 1:1 mixture of  $\alpha$ - and  $\beta$ -anomer [on the basis of the triplets (*J* 10) at  $\delta$  5.22 and 5.52 (attributable to the 3-H signals of the  $\beta$ - and  $\alpha$ -anomer]; there was also evidence for the presence of  $\approx 25\%$  of the dibromide 14 as an 80:20 mixture of diastereomers [on the basis of the singlets at  $\delta$  6.35 and 6.50 (attributed to the 4-H signals of the minor and major dibromides)].

Reaction involving the butenone 10 and 2-methylpropan-2ol. The reaction of the butenone 10 (0.215 g, 0.50 mmol) in 2-methylpropan-2-ol (30 cm<sup>3</sup>) at  $\approx$ 30 °C for 2 h gave rise to a product containing largely the tetraacetylglucose 13 as a 2:1 mixture of  $\alpha$ - and  $\beta$ -anomer; there was also evidence for the presence of  $\approx$ 10% of the dibromide 14 as an 80:20 mixture of diastereomers.

Reaction involving the butenone 10 and benzyl alcohol. The reaction of the butenone 10 (0.225 g, 0.52 mmol) in benzyl alcohol (2 cm<sup>3</sup>) for 1 h gave rise (after removal of PhCH<sub>2</sub>OH by azeotropic distillation with water) to a product comprising mainly an 89:11 mixture of the bromo(benzyloxy) adducts 11e and 12e [the ratio was estimated from the integrals of the singlets at  $\delta$  2.20 and 2.38 (attributed to the 1-H<sub>3</sub> signals of 11e and 12e)];  $\approx 2\%$  of succinimide was also present.

Crystallisation of the mixture from diethyl ether-hexanes (3R,4R)-4-benzyloxy-3-bromo-3-methyl-4-(2',3',4',6'gave tetra-O-acetyl-β-D-glucopyranosyloxy)butan-2-one **11e** (0.139 g, 43%); mp 118-120 °C; [a]<sub>D</sub> -41 (c 0.57, CH<sub>2</sub>Cl<sub>2</sub>) (Found: C, 50.8; H, 5.3; Br, 12.9. C<sub>26</sub>H<sub>33</sub>BrO<sub>12</sub> requires C, 50.6; H, 5.4; Br, 13.0%);  $\lambda_{max}$  (EtOH)/nm 206 ( $\varepsilon$  9700), 251 (210), 257 (230), 263 (180), 267 (120) and 294 (65);  $v_{max}$  (KBr)/cm<sup>-1</sup> 1755 (ester C=O) and 1725 (ketone C=O);  $\delta_{\rm H}$  (300 MHz; CDCl<sub>3</sub>) 1.81 (3 H, s, 3-Me), 2.00, 2.03, 2.06 and 2.10 (each 3 H, s,  $4 \times MeCO_2$ ), 2.20 (3 H, s, 1-H<sub>3</sub>), 3.83 (1 H, ddd, J 2.5, 5 and 10, 5'-H), 4.20 and 4.28 [each 1 H, dd (J 5 and 12.5) and dd (J 2.5 and 12.5), 6'-H<sub>2</sub>], 4.53 and 4.91 (each 1 H, d, J 11.5, PhCH<sub>2</sub>), 4.93 (1 H, d, J 8, 1'-H), 5.11 (1 H, t, J 10, 4'-H), 5.17 (1 H, dd, J 8 and 9.5, 2'-H), 5.19 (1 H, s, 4-H), 5.30 (1 H, t, J 9.5, 3'-H) and 7.22–7.35 (m,  $C_6H_5$  and  $CHCl_3$ );  $\delta_C$  (100 MHz;  $CDCl_3$ ) 19.5 ( $CH_3C$ ), 20.6, 20.7 and 20.9 ( $4 \times CH_3CO_2$ ), 24.9 (1-CH<sub>3</sub>), 62.0 (6'-CH<sub>2</sub>), 66.8 (3-C), 68.4, 71.1, 72.1 and 72.6 (2'-, 3'-, 4'- and 5'-CH), 71.1 (PhCH2), 100.7 (1'-CH), 104.2 (4-CH), 127.9, 128.0 and 128.4 (5 × phenyl CH), 136.9 (phenyl C), 169.3, 169.4, 170.2 and 170.4 (4 × MeCO) and 200.0 (2-CO); m/z (FAB) 331  $(C_{14}H_{19}O_{9}^{+}, 60\%)$ , 169 (70), 109 (70) and 91  $(C_{7}H_{7}^{+}, 100)$ .

Reaction involving the butenone 10 and 2-methylpropan-1ol. The reaction of the butenone 10 (0.225 g, 0.52 mmol) in 2-methylpropan-1-ol (10 cm<sup>3</sup>) for 3 h gave rise to a product comprising mainly an 88:12 mixture of the bromo(methylpropoxy) adducts 11f and 12f [the ratio was estimated from the integrals of the singlets at  $\delta$  2.32 and 2.38 (attributed to the 1-H<sub>3</sub> signals of 11f and 12f)]; ≈11% of succinimide was also present.

Crystallisation of the mixture from chloroform–diethyl ether–light petroleum gave (3R,4R)-3-bromo-3-methyl-4-(2-methylpropoxy)-4-(2',3',4',6'-tetra-O-acetyl- $\beta$ -D-glucopyrano-syloxy)butan-2-one **11f** (0.167 g, 55%); mp 124–126 °C;  $[a]_{\rm D}$  –24 (c 0.5, CH<sub>2</sub>Cl<sub>2</sub>) (Found: C, 47.1; H, 5.9; Br, 14.0. C<sub>23</sub>H<sub>35</sub>BrO<sub>12</sub> requires C, 47.3; H, 6.0; Br, 13.7%);  $\lambda_{\rm max}$  (EtOH)/ nm 294 ( $\epsilon$  100);  $\nu_{\rm max}$  (KBr)/cm<sup>-1</sup> 1760 and 1740 (ester C=O) and 1730 (ketone C=O);  $\delta_{\rm H}$  (300 MHz; CDCl<sub>3</sub>) 0.80 and 0.81 (each 3 H, d, J 7, Me<sub>2</sub>CH), 1.72–1.82 (1 H, m, Me<sub>2</sub>CH), 1.78 (3 H, s, 3-Me), 2.02, 2.04, 2.07 and 2.08 (each 3 H, s, 4 × MeCO<sub>2</sub>), 2.32 (3 H, s, 1-H<sub>3</sub>), 3.08 and 3.72 (each 1 H, dd, J 7 and 9, Me<sub>2</sub>-CHCH<sub>2</sub>O), 3.73–3.79 (1 H, m, 5'-H), 4.16 and 4.24 [each 1 H,

dd (J 5 and 12.5) and dd (J 2.5 and 12.5), 6'-H<sub>2</sub>], 4.84 (1 H, d, J 8, 1'-H), 5.02 (1 H, s, 4-H), 5.08 (1 H, t, J 10, 4'-H), 5.11 (1 H, dd, J 8 and 10, 2'-H) and 5.26 (1 H, t, J 9.5, 3'-H);  $\delta_{\rm C}$  (100 MHz; CDCl<sub>3</sub>) 19.1, 19.2 and 19.3 [(CH<sub>3</sub>)<sub>2</sub>CH and CH<sub>3</sub>C], 20.6, 20.7 and 20.9 (4 × CH<sub>3</sub>CO<sub>2</sub>), 24.9 (1-CH<sub>3</sub>), 28.2 (Me<sub>2</sub>CH), 62.0 (6'-CH<sub>2</sub>), 66.6 (3-C), 68.4, 71.1, 71.9 and 72.6 (2'-, 3'-, 4'- and 5'-CH), 76.4 (CH<sub>2</sub>O), 100.6 (1'-CH), 104.9 (4-CH), 169.3, 169.4, 170.2 and 170.4 (4 × MeCO) and 200.0 (2-CO); *m/z* (FAB) 331 (C<sub>14</sub>H<sub>19</sub>O<sub>9</sub><sup>+</sup>, 90), 235 and 233 (C<sub>9</sub>H<sub>16</sub>BrO<sub>2</sub><sup>+</sup>, each 30), and 169 (100).

Reaction involving the butenone 10 and 2,2-dimethylpropan-1ol. The reaction of the butenone 10 (0.157 g, 0.37 mmol) in 2,2-dimethylpropan-1-ol (3.0 cm<sup>3</sup>) at  $\approx$ 55 °C for 1 h gave rise to a product comprising mainly a 76:10:14 mixture of compounds 11g, 12g and 14 [the proportions were estimated from the integrals of the singlets at  $\delta$  2.32, 2.38 and 2.41 (attributed to the 1-H<sub>3</sub> signals of 11g, 12g and 14)].

Crystallisation of the material from dichloromethane–diethyl ether–light petroleum gave a 91:9 mixture of (3R,4R)-3-bromo-4-(2,2-dimethylpropoxy)-3-methyl-4-(2',3',4',6'-tetra-*O*-acetyl-β-D-glucopyranosyloxy)butan-2-one **11g** and 3,4-dibromo-3-methyl-4-(2',3',4',6'-tetra-*O*-acetyl-β-D-glucopyranosyloxy)butan-2-one **14** (as a single diastereomer) (0.043 g);  $\delta_{\rm H}$  (300 MHz; CDCl<sub>3</sub>) (for **11g**) 0.82 (9 H, s, Me<sub>3</sub>C), 1.78 (3 H, s, 3-Me), 2.02, 2.05, 2.07 and 2.08 (each 3 H, s, 4 × MeCO<sub>2</sub>), 2.32 (3 H, s, 1-H<sub>3</sub>), 2.95 and 3.63 (each 1 H, d, J 9, CH<sub>2</sub>O), 3.76 (1 H, ddd, J 2.5, 5 and 10, 5'-H), 4.16 and 4.25 [each 1 H, dd (J 5 and 12.5) and dd (J 2.5 and 12.5), 6'-H<sub>2</sub>], 4.83 (1 H, d, J 8, 1'-H), 5.01 (1 H, s, 4-H), 5.06–5.14 (2 H, m, 2'- and 4'-H) and 5.27 (1 H, t, J 9.5, 3'-H).

Reaction involving the butenone 17b and propan-1-ol. The reaction of butenone 17b (0.225 g, 1.56 mmol) in propan-1-ol (18 cm<sup>3</sup>) for 1 h gave rise to a product that was mainly the bromo(propoxy) adduct 18. Column chromatography [hexanes-EtOAc (9.1) as eluent] provided  $(3R^*, 4R^*)$ -3-bromo-4-methoxymethoxy-3-methyl-4-propoxybutan-2-one 18 (0.250 g, 57%) as a clear oil (Found: C, 42.1; H, 7.0; Br, 28.5. C<sub>10</sub>H<sub>19</sub>BrO<sub>4</sub> requires C, 42.4; H, 6.8; Br, 28.2%); λ<sub>max</sub> (EtOH)/nm 291 (ε 95);  $v_{\text{max}}$  (film)/cm<sup>-1</sup> 1725 (ketone C=O);  $\delta_{\text{H}}$  (300 MHz; CDCl<sub>3</sub>) 0.86 (3 H, t, J 7.5, MeCH<sub>2</sub>), 1.54 (2 H, sextet, separation 7, MeCH<sub>2</sub>), 1.81 (3 H, s, 3-Me), 2.35 (3 H, s, 1-H<sub>3</sub>), 3.43 (3 H, s, MeO), 3.46 and 3.74 (each 1 H, dt, J 9 and 6.5, EtCH<sub>2</sub>O), 4.81 (2 H, AB q, J 7, separation of inner lines 3, OCH<sub>2</sub>O) and 4.98 (1 H, s, 4-H);  $\delta_{\rm C}$  (100 MHz; CDCl<sub>3</sub>) 10.6 (CH<sub>3</sub>CH<sub>2</sub>), 20.6 (CH<sub>3</sub>C), 23.0 (MeCH<sub>2</sub>), 25.6 (1-CH<sub>3</sub>), 56.3 (CH<sub>3</sub>O), 67.6 (3-C), 72.2 (EtCH<sub>2</sub>O), 96.1 (OCH<sub>2</sub>O), 103.7 (4-CH) and 200.9 (2-CO); m/z (CI) 302 and 300 (MNH<sub>4</sub><sup>+</sup>, each 100%), 240 and 238  $(C_7H_{11}BrO_4^+, each 25)$ , 180 and 178  $(C_5H_7BrO_2^{++}, each 35)$ , 160 (45) and 143 (95).

*Reaction involving the butenone* **21** *and ethanol.* The reaction of the butenone **21**<sup>7</sup> (0.217 g, 0.52 mmol) in ethanol (3 cm<sup>3</sup>) for 0.5 h gave rise to a product comprising mainly a 71:29 mixture of the bromo(ethoxy) adducts **22a** and **23a** [the ratio was estimated from the integrals of the singlets at  $\delta$  2.32 and 2.35 (attributed to the 1-H<sub>3</sub> signals of **22a** and **23a**)]; ≈20% of the tetraacetylglucose **13** was also present.

Subjection of the mixture to column chromatography (CHCl<sub>3</sub> as eluent) gave an orange oil (0.211 g) comprising mainly a 75:25 mixture of the bromo(ethoxy) adducts **22a** and **23a**. Three crystallisations of the material from ethyl acetate–light petroleum gave a 97:3 mixture of (3R,4R)-3-bromo-4-ethoxy-4-(2',3',4',6'-tetra-O-acetyl- $\beta$ -D-glucopyranosyloxy)-butan-2-one **22a** and its (3S,4S)-diastereomer **23a** (0.020 g, 7%); mp 90–93 °C;  $[a]_D - 9 (c 0.27, CH_2Cl_2)$  (Found: C, 44.2; H, 5.4; Br, 15.2. C<sub>20</sub>H<sub>29</sub>BrO<sub>12</sub> requires C, 44.4; H, 5.4; Br, 14.8%);  $\lambda_{max}$  (EtOH)/nm 294 ( $\varepsilon$  90);  $\nu_{max}$ (KBr)/cm<sup>-1</sup> 1755 (ester C=O) and 1745 (ester and ketone C=O);  $\delta_H$  (300 MHz; CDCl<sub>3</sub>) (for **22a**) 1.14 (3 H, t, J 7, MeCH<sub>2</sub>), 2.01, 2.04, 2.06 and 2.07 (each 3 H, s, 4 × MeCO<sub>2</sub>), 2.32 (3 H, s, 1-H<sub>3</sub>), 3.54 and 3.87 (each 1 H, dq, J 9.5 and 7, MeCH<sub>2</sub>O), 3.74 (1 H, ddd, J 3, 5.5 and 10,

5'-H), 4.15 and 4.22 [each 1 H, dd, (J 5.5 and 12) and dd (J 3 and 12), 6'-H<sub>2</sub>], 4.29 (1 H, d, J 7.5, 3-H), 4.81 (1 H, d, J 8, 1'-H), 4.95 (1 H, d, J 7.5, 4-H), 5.06 (1 H, t, J 10, 4'-H), 5.07 (1 H, dd, J 8 and 9.5, 2'-H) and 5.24 (1 H, t, J 9.5, 3'-H); m/z (FAB) 565 and 563 (MNa<sup>+</sup>, each 1%), 543 and 541 (MH<sup>+</sup>, each 1), 331 (C<sub>14</sub>H<sub>19</sub>O<sub>9</sub><sup>+</sup>, 100), 195 and 193 (C<sub>6</sub>H<sub>10</sub>BrO<sub>2</sub><sup>+</sup>, each 60) and 169 (90).

Reaction involving the butenone 21 and propan-1-ol. The reaction of the butenone 21 (0.279 g, 0.67 mmol) in propan-1-ol (3 cm<sup>3</sup>) gave rise to a product comprising mainly a 72:28 mixture of the bromo(propoxy) adducts 22b and 23b [the ratio was estimated from the integrals of the singlets at  $\delta$  2.31 and 2.35 (attributed to the 1-H<sub>3</sub> signals of 22b and 23b)];  $\approx$ 25% of the tetraacetylglucose 13 was also present.

Subjection of the mixture to column chromatography (CHCl<sub>3</sub> as eluent) gave an orange oil (0.238 g) comprising mainly a 75:25 mixture of the bromo(propoxy) adducts 22b and **23b**. Crystallisation of the material from ethyl acetate–light petroleum gave a 50:50 mixture of the bromo(propoxy) adducts 22b and 23b (0.044 g, 12%) as an off-white solid; evaporation of the mother liquor gave a residue (0.140 g, 38%) comprising a 80:20 mixture of the bromo(propoxy) adducts 22b and 23b. A further crystallisation of the 80:20 mixture failed to provide pure material; on storage, however, the filtrate deposited another crop of crystals (0.016 g, 4%) comprising a 94:6 mixture of (3R,4R)-3-bromo-4-propoxy-4-(2',3',4',6'tetra-O-acetyl-β-D-glucopyranosyloxy)butan-2-one **22b** and its (3S,4S)-diastereomer **23b**; mp 62–73 °C;  $[a]_D$  –6 (c 0.33, CH<sub>2</sub>Cl<sub>2</sub>) (Found: C, 45.7; H, 5.9; Br, 14.1. C<sub>21</sub>H<sub>31</sub>BrO<sub>12</sub> requires C, 45.5; H, 5.6; Br, 14.4%);  $\lambda_{max}$  (EtOH)/nm 291 ( $\varepsilon$  150);  $v_{max}$ (KBr)/cm<sup>-1</sup> 1755 (ester C=O) and 1740sh (ketone C=O);  $\delta_{\rm H}$  (300 MHz; CDCl<sub>3</sub>) (for **22b**) 0.86 (3 H, t, J 7.5, MeCH<sub>2</sub>), 1.47-1.57 (2 H, m, MeCH<sub>2</sub>), 2.01, 2.04, 2.06 and 2.08 (each 3 H, s, 4 × MeCO<sub>2</sub>), 2.31 (3 H, s, 1-H<sub>3</sub>), 3.40 (1 H, dt, J 9.5 and 7, EtCHHO), 3.71-3.82 (2 H, m, 5'-H and EtCHHO), 4.16 and 4.21 [each 1 H, dd (J 5.5 and 12.5) and dd (J 3 and 12.5), 6'-H<sub>2</sub>], 4.29 (1 H, d, J 7.5, 3-H), 4.81 (1 H, d, J 8, 1'-H), 4.94 (1 H, d, J 7.5, 4-H), 5.06 (1 H, t, J 10, 4'-H), 5.07 (1 H, dd, J 8 and 9.5, 2'-H) and 5.23 (1 H, t, J 9.5, 3'-H); m/z (FAB) 579 and 577 (MNa<sup>+</sup>, each 2%), 331 (C<sub>14</sub>H<sub>19</sub>O<sub>9</sub><sup>+</sup>, 60), 209 and 207 ( $C_7H_{12}BrO_2^+$ , each 50) and 169 (100).

Reaction involving the butenone 21 and benzyl alcohol. The reaction of the butenone 21 (0.635 g, 1.53 mmol) in benzyl alcohol (16 cm<sup>3</sup>) for 40 min gave (after removal of PhCH<sub>2</sub>OH by azeotropic distillation with water) a product comprising mainly an 80:20 mixture of the bromo(benzyloxy) adducts 22c and 23c [the ratio was estimated from the integrals of the singlets at  $\delta$  2.25 and 2.31 (attributed to the 1-H<sub>3</sub> signals of 22c and 23c)];  $\approx 10\%$  of the tetraacetylglucose 13 was also present.

Subjection of the mixture to column chromatography (CHCl<sub>3</sub> as eluent) and crystallisation of the product from methanol gave an 84:16 mixture of (3R,4R)-4-benzyloxy-3bromo-4-(2',3',4',6'-tetra-O-acetyl-β-D-glucopyranosyloxy)butan-2-one 22c and its (3S,4S)-diastereomer 23c (0.411 g, 45%); mp 84–86 °C; [*a*]<sub>D</sub> –5 (*c* 0.35, CH<sub>2</sub>Cl<sub>2</sub>) (Found: C, 49.8; H, 5.2; Br, 13.3. C<sub>25</sub>H<sub>31</sub>BrO<sub>12</sub> requires C, 49.8; H, 5.1; Br, 13.1%);  $\lambda_{\rm max}$  (EtOH)/nm 205 (<br/>  $\varepsilon$ 9100), 252 (250), 257 (280), 263 (230), 267 (170) and 294 (90);  $v_{max}$  (KBr)/cm<sup>-1</sup> 1760 (ester C=O) and 1740 (ester and ketone C=O);  $\delta_{\rm H}$  (300 MHz; CDCl<sub>3</sub>) (for **22c**) 2.01, 2.02, 2.04 and 2.08 (each 3 H, s, 4 × MeCO<sub>2</sub>), 2.25 (3 H, s, 1-H<sub>3</sub>), 3.75 (1 H, dt, J 10 and 4, 5'-H), 4.19 (2 H, d, separation 4, 6'-H<sub>2</sub>), 4.33 (1 H, d, J 7.5, 3-H), 4.55 and 4.85 (each 1 H, d, J 11.5, PhCH<sub>2</sub>O), 4.86 (1 H, d, J 8, 1'-H), 5.07-5.15 (3 H, m, 4-, 2'- and 4'-H), 5.25 (1 H, t, J 9.5, 3'-H) and 7.24–7.39 (m,  $C_6H_5$  and  $CHCl_3$ ); m/z (FAB) 331 ( $C_{14}H_{19}O_9^+$ , 60%), 169 (75) and 91 (C<sub>7</sub>H<sub>7</sub><sup>+</sup>, 100).

Reaction involving the pentenone 24 and propan-1-ol. (a) The reaction of the pentenone  $24^6$  (0.225 g, 0.51 mmol) in propan-1-ol (15 cm<sup>3</sup>) for 5 h gave rise to a product comprising mainly an 87:13 mixture of the bromo(propoxy) adducts 28

and **29** [the ratio was estimated from the heights of the singlets at  $\delta$  203.3 and 204.9 (attributed to the 3-CO groups of **28** and **29**)].

Crystallisation of the mixture from methanol afforded (1R,2R)-2-bromo-2-methyl-1-propoxy-1-(2',3',4',6'-tetra-O-

acetyl- $\beta$ -D-glucopyranosyloxy)pentan-3-one 28 (0.150 g, 51%); mp 174–175 °C;  $[a]_{D}$  –24 (c 0.9, CH<sub>2</sub>Cl<sub>2</sub>) (Found: C, 47.4; H, 6.0; Br, 14.0. C<sub>23</sub>H<sub>35</sub>BrO<sub>12</sub> requires C, 47.4; H, 6.1; Br, 13.7%);  $\lambda_{max}$  (EtOH)/nm 295 ( $\epsilon$  80);  $\nu_{max}$ (KBr)/cm<sup>-1</sup> 1760 (ester C=O) and 1730 (ketone C=O);  $\delta_{\rm H}$  (300 MHz; CDCl<sub>3</sub>) 0.80 (3 H, t, J 7.5, MeCH<sub>2</sub>), 1.09 (3 H, t, J 7, 5-H<sub>3</sub>), 1.48 (2 H, sextet, separation 7, MeCH<sub>2</sub>), 1.79 (3 H, s, 2-Me), 2.01, 2.03, 2.05 and 2.06 (each 3 H, s,  $4 \times MeCO_2$ ), 2.52–2.81 (2 H, m, 4-H<sub>2</sub>), 3.31 and 3.85 (each 1 H, dt, J 9.5 and 7, EtCH<sub>2</sub>O), 3.76 (1 H, ddd, J 2.5, 5 and 10, 5'-H), 4.15 and 4.23 [each 1 H, dd (J 5 and 12.5) and dd (J 2.5 and 12.5), 6'-H<sub>2</sub>], 4.83 (1 H, d, J 8, 1'-H), 5.02–5.14 (2 H, m, 2'- and 4'-H), 5.06 (1 H, s, 1-H) and 5.26 (1 H, t, J 9.5, 3'-H);  $\delta_{\rm C}$  (100 MHz; CDCl<sub>3</sub>) 8.1 (5-CH<sub>3</sub>), 10.4 (CH<sub>3</sub>CH<sub>2</sub>), 19.3 (CH<sub>3</sub>C), 20.6, 20.7 and 21.0 (4 × CH<sub>3</sub>CO<sub>2</sub>), 22.5 (MeCH<sub>2</sub>), 30.3 (4-CH<sub>2</sub>), 62.1 (6'-CH<sub>2</sub>), 66.5 (2-C), 68.5, 71.1, 71.9 and 72.6 (2'-, 3'-, 4'- and 5'-CH), 71.5 (EtCH<sub>2</sub>), 100.7 (1'-CH), 105.0 (1-CH), 169.3, 169.5, 170.2 and 170.4 (4 × MeCO) and 203.3 (3-CO); *m/z* (FAB) 331 (C<sub>14</sub>H<sub>19</sub>O<sub>9</sub><sup>+</sup>, 100%), 237 and 235  $(C_9H_{16}BrO_2^+, each 25)$ , and 169 (70).

(b) The reaction of the pentenone **24** (1.54 g, 3.5 mmol) in propan-1-ol (170 cm<sup>3</sup>) was left for 6 h at 30 °C and overnight at -30 °C. Filtration and recrystallisation of the product from hot propan-1-ol gave the bromo(propoxy) adduct **28a** (1.11 g, 55%).

Reaction involving the methylenecyclopentanone 25a and propan-ol. The reaction of the cyclopentanone  $25a^4$  (0.442 g, 1.00 mmol) in propan-1-ol (50 cm<sup>3</sup>) for 2 h gave rise to a product comprising mainly an 87:13 mixture of the bromo-(propoxy) adducts 30a and 31a [the ratio was estimated from the heights of the singlets at  $\delta$  22.4 and 22.8 (attributed to the MeCH<sub>2</sub> signals of 30a and 31a)].

Crystallisation of the material from ethyl acetate-hexanes gave (2R)-2-bromo-2-[(R)-propoxy-(2,3,4,6-tetra-O-acetyl- $\beta$ -*D*-glucopyranosyloxy)methyl]cyclopentanone **30a** (0.304 g, 52%); mp 112 °C; [a]<sub>D</sub> -12 (c 0.63, CH<sub>2</sub>Cl<sub>2</sub>) (Found: C, 47.2; H, 5.5; Br, 13.4. C23H33BrO12 requires C, 47.5; H, 5.7; Br, 13.7%); v<sub>max</sub>(KBr)/cm<sup>-1</sup> 1760 (easter C=O) and 1750 (ester and ketone C=O); δ<sub>H</sub> (300 MHz; CDCl<sub>3</sub>) 0.82 (3 H, t, J 7.5, MeCH<sub>2</sub>), 1.50 (2 H, sextet, separation 7, MeCH<sub>2</sub>), 2.04, 2.06, 2.08 and 2.09 (each 3 H, s, 4 × MeCO<sub>2</sub>), 2.41–2.53 and 2.58–2.71 (each 1 H, m, 5-H<sub>2</sub>), 3.38 and 3.87 (each 1 H, dt, J 9 and 6.5, EtCH<sub>2</sub>O), 3.77 (1 H, ddd, J 2.5, 5.5 and 10, 5'-H), 4.17 and 4.23 [each 1 H, dd (J 5.5 and 12.5) and dd (J 2.5 and 12.5), 6'-H<sub>2</sub>], 4.86 (1 H, d, J 8, 1'-H), 4.98 (OCHO), 5.07 (1 H, t, J 9.5, 4'-H), 5.12 (1 H, dd, J 8 and 10, 2'-H) and 5.29 (1 H, t, J 10, 3'-H) (the 3- and 4-H<sub>2</sub> signals appeared in the  $\delta$  1.97–2.21 region and were partly obscured by the MeCO<sub>2</sub> signals);  $\delta_{\rm C}$  (100 MHz; CDCl<sub>3</sub>) 10.3  $(CH_3CH_2)$ , 18.7 (4-CH<sub>2</sub>), 20.5 and 20.9 (4 × CH<sub>3</sub>CO<sub>2</sub>), 22.4 (MeCH<sub>2</sub>), 32.6 (3-CH<sub>2</sub>), 36.5 (5-CH<sub>2</sub>), 62.1 (6'-CH<sub>2</sub>), 66.0 (2-C), 68.4, 71.0, 71.8 and 72.4 (2'-, 3'-, 4'- and 5'-CH), 71.9 (EtCH<sub>2</sub>), 100.7 (1'-CH), 105.1 (OCHO), 169.1, 169.4, 170.0 and 170.3 (4 × MeCO) and 209.7 (1-CO); m/z (FAB) 331  $(C_{14}H_{19}O_9^+, 100\%)$ , 235 and 233  $(C_9H_{14}BrO_2^+, each 25)$ , 193 and 191 ( $C_6H_8BrO_2^+$ , each 65) and 169 (95) [(after addition of KI) 621 and 619 (MK<sup>+</sup>, each 100%)].

Reaction involving the methylenecyclohexanone 25b and propan-1-ol. (a) The reaction of the cyclohexanone  $25b^4$ (0.456 g, 1.00 mmol) in propan-1-ol (50 cm<sup>3</sup>) for 2 h gave rise to a product comprising mainly an 87:13 mixture of the bromo-(propoxy) adducts 30b and 31b [the ratio was estimated from the integrals of the singlets at  $\delta$  202.4 and 202.8 (attributed to the 1-CO signals of 30b and 31b)];  $\approx$ 20% of the tetraacetylglucose 13 was also present.

Crystallisation of the material from ethanol gave (2R)-2-bromo-2-[(R)-propoxy-(2',3',4',6'-tetra-O-acetyl- $\beta$ -D-glucopyranosyloxy)methyl]cyclohexanone **30b** (0.120 g, 20%); mp 110 °C; [a]<sub>D</sub> +70 (c 0.44, CH<sub>2</sub>Cl<sub>2</sub>) (Found: C, 48.3; H, 5.9; Br, 13.2. C<sub>24</sub>H<sub>35</sub>BrO<sub>12</sub> requires C, 48.4; H, 5.9; Br, 13.4%); v<sub>max</sub> (KBr)/cm<sup>-1</sup> 1760 and 1745sh (ester C=O) and 1720 (ketone C=O);  $\delta_{\rm H}$  (400 MHz; CDCl<sub>3</sub>) 0.84 (3 H, t, J 7.5, MeCH<sub>2</sub>), 1.45– 1.61 (2 H, m, MeCH<sub>2</sub>), 1.80-2.40 (≈7 H, m, 3-, 4- and 5-H<sub>2</sub> and 6-Hea), 2.03, 2.06, 2.07 and 2.08 (each 3 H, s, 4 × MeCO<sub>2</sub>), 2.96 (1 H, ddd, J 6.5, 14 and 16, 6-H<sub>ax</sub>), 3.50 and 3.93 (each 1 H, dt, J 9 and 6.5, EtCH<sub>2</sub>O), 3.78 (1 H, ddd, J 2.5, 5.5 and 10, 5'-H), 4.18 and 4.24 [each 1 H, dd (J 5.5 and 12) and dd (J 2.5 and 12), 6'-H<sub>2</sub>], 4.82 (1 H, d, J 8, 1'-H), 5.06 (1 H, t, J 9.5, 4'-H), 5.13 (1 H, dd, J 8 and 9.5, 2'-H), 5.15 (1 H, s, OCHO) and 5.28 (1 H, t, J 9.5, 3'-H); δ<sub>C</sub> (100 MHz; CDCl<sub>3</sub>) 10.5 (CH<sub>3</sub>CH<sub>2</sub>), 20.3 (4- or 5-CH<sub>2</sub>), 20.7 and 21.1 (4 × CH<sub>3</sub>CO<sub>2</sub>), 22.7 (MeCH<sub>2</sub>), 24.8 (5- or 4-CH<sub>2</sub>), 31.7 (3-CH<sub>2</sub>), 36.8 (6-CH<sub>2</sub>), 62.3 (6'-CH<sub>2</sub>), 68.6, 71.2, 72.0 and 72.6 (2'-, 3'-, 4'- and 5'-CH), 68.7 (2-C), 71.9 (EtCH<sub>2</sub>), 101.0 (1'-CH), 105.2 (OCHO), 169.3, 169.5, 170.2 and 170.5  $(4 \times \text{MeCO})$  and 202.4 (1-CO); m/z (FAB) 331 (C<sub>14</sub>H<sub>19</sub>O<sub>9</sub><sup>+</sup>, 65), 249 and 247 ( $C_{10}H_{16}BrO_2^+$ , each 35), 207 and 205 ( $C_7H_{10}BrO_2^+$ each 45), 179 and 177 (C<sub>6</sub>H<sub>10</sub>BrO<sup>+</sup>, each 30) and 169 (100) [(after addition of KI) 635 and 633 ( $MK^+$ , each 90%)].

(b) The aforecited reaction of the cyclohexanone **25b** (2.53 g, 5.5 mmol) was repeated but, additionally, the solution was washed with 5% aq. sodium hydroxide. Evaporation left a brown residue (containing no tetraacetate **13** by <sup>1</sup>H NMR spectroscopy), which was dissolved in boiling ethanol, treated with charcoal and filtered. On cooling, the filtrate deposited compound **30b** (0.670 g, 20%). The filtrate was evaporated and the residue crystallised from ethyl acetate–light petroleum to give a further quantity (0.640 g, 19%) of compound **30b**.

Reaction involving the propenoate 32a and propan-1-ol. The reaction of the propenoate  $32a^4$  (0.500 g, 1.12 mmol) in propan-1-ol (20 cm<sup>3</sup>) for 1 h gave rise to a residue comprising mainly an 85:15 mixture of the bromo(propoxy) adducts 33a and 34a [the ratio was estimated from the heights of the singlets at  $\delta$  22.4 and 23.0 (attributed to the MeCH<sub>2</sub> signals of 33a and 34a)].

Crystallisation of the material from diethyl ether gave methyl (2R,3R)-2-bromo-2-methyl-3-propoxy-3-(2',3',4',6'-tetra-Oacetyl- $\beta$ -D-glucopyranosyloxy)propanoate **33a** (0.343 g, 52%); mp 155–157 °C; [a]<sub>D</sub> –16 (c 0.1, CH<sub>2</sub>Cl<sub>2</sub>) (Found: C, 45.4; H, 5.8; Br, 14.2.  $C_{22}H_{33}BrO_{13}$  requires C, 45.1; H, 5.7; Br, 13.7%);  $v_{max}(KBr)/cm^{-1}$  1760 and 1730 (ester C=O);  $\delta_H$  (300 MHz; CDCl<sub>3</sub>) 0.82 (3 H, t, J 7, MeCH<sub>2</sub>), 1.40–1.60 (2 H, m, MeCH<sub>2</sub>), 1.80 (3 H, s, 2-Me), 2.02, 2.04, 2.06 and 2.08 (each 3 H, s,  $4 \times MeCO_2$ ), 3.35 and 3.87 [each 1 H, dt (J 9.5 and 7) and dt (J 9.5 and 6), EtCH<sub>2</sub>O], 3.73–3.81 (1 H, m, 5'-H), 3.79 (3 H, s, MeO), 4.16 and 4.24 [each 1 H, dd (J 5 and 12.5) and dd (J 5 and 12.5), 6'-H<sub>2</sub>], 4.85 (1 H, d, J 8, 1'-H), 5.06 (1 H, t, J 10, 4'-H), 5.08 (1 H, s, 3-H), 5.13 (1 H, dd, J 8 and 10, 2'-H) and 5.28 (1 H, t, J 9.5, 3'-H);  $\delta_{\rm C}$  (100 MHz; CDCl<sub>3</sub>) 10.3 (CH<sub>3</sub>CH<sub>2</sub>), 19.4 (CH<sub>3</sub>C), 20.5, 20.6 and 20.9 (4 × CH<sub>3</sub>CO<sub>2</sub>), 22.4 (MeCH<sub>2</sub>), 52.9 (CH<sub>3</sub>O), 60.0 (2-C), 62.0 (6'-CH<sub>2</sub>), 68.5, 71.0, 71.8 and 72.4 (2'-, 3'-, 4'- and 5'-CH), 71.6 (EtCH<sub>2</sub>), 100.8 (1'-CH), 105.0 (3-CH) and 169.2, 169.3, 169.4, 170.0 and 170.2 (1-CO and  $4 \times MeCO$ ; m/z (FAB) 331 (C<sub>14</sub>H<sub>19</sub>O<sub>9</sub><sup>+</sup>, 80), 239 and 237  $(C_8H_{14}BrO_3^+, each 90)$ , 197 and 195  $(C_5H_8BrO_3^+, each 90)$  and 169 (100).

Reaction involving the propenoate **32b** and propan-1-ol. (With P. M. Cowley.) The reaction of the propenoate **32b** (0.500 g, 1.16 mmol) in propan-1-ol (70 cm<sup>3</sup>) for 3 h gave rise to a residue comprising mainly a 78:22 mixture of the bromo-(propoxy) adducts **33b** and **34b** [the ratio was estimated from the heights of the singlets at  $\delta$  22.8 and 23.1 (attributed to the MeCH<sub>2</sub> signals of **33b** and **34b**].

Subjection of the product to column chromatography [Et<sub>2</sub>O– light petroleum (2:1) as eluent] and crystallisation of the chromatographed material (from Et<sub>2</sub>O–light petroleum) gave *methyl* (2R,3R)-2-bromo-3-propoxy-3-(2',3',4',6'-tetra-Oacetyl- $\beta$ -D-glucopyranosyloxy)propanoate **33b** (0.118 g, 18%); mp 67–68 °C; [a]<sub>D</sub> = 27 (c 0.2, CH<sub>2</sub>Cl<sub>2</sub>) (Found: C, 44.1; H, 5.4; Br, 14.4.  $C_{21}H_{31}BrO_{13}$  requires C, 44.1; H, 5.5; Br, 14.0);  $\nu_{max}$  (KBr)/cm<sup>-1</sup> 1750 (ester C=O);  $\delta_{H}$  (300 MHz; CDCl<sub>3</sub>) 0.86 (3 H, t, *J* 7.5, *Me*CH<sub>2</sub>), 1.40–1.60 (2 H, m, MeCH<sub>2</sub>), 2.01, 2.04, 2.06 and 2.09 (each 3 H, s, 4 × MeCO<sub>2</sub>), 3.43 (1 H, dt, *J* 9.5 and 7, EtC*H*HO), 3.72–3.83 (2 H, m, 5'-H and EtCH*HO*), 3.78 (3 H, s, MeO), 4.15 and 4.21 [each 1 H, dd (*J* 6 and 12.5) and dd (*J* 3 and 12.5), 6'-H<sub>2</sub>], 4.27 (1 H, d, *J* 8, 2-H), 4.86 (1 H, d, *J* 8, 1'-H), 4.97–5.12 (3 H, m, 2'-, 3- and 4'-H) and 5.24 (1 H, t, *J* 9.5, 3'-H);  $\delta_{C}$  (100 MHz; CDCl<sub>3</sub>) 10.7 (CH<sub>3</sub>CH<sub>2</sub>), 20.9 and 21.1 (4 × CH<sub>3</sub>CO<sub>2</sub>), 22.8 (MeCH<sub>2</sub>), 45.6 (2-CH), 53.3 (CH<sub>3</sub>O), 62.5 (6'-CH<sub>2</sub>), 68.9, 71.4, 72.4 and 73.1 (2'-, 3'-, 4'- and 5'-CH), 71.8 (EtCH<sub>2</sub>), 98.6 (1'-CH), 103.1 (3-CH) and 168.3, 169.5, 169.8, 170.6 and 170.8 (1-CO and 4 × MeCO); *m/z* (FAB) 331 (C<sub>14</sub>H<sub>19</sub>O<sub>9</sub><sup>+</sup>, 80%), 225 and 223 (C<sub>7</sub>H<sub>12</sub>BrO<sub>3</sub><sup>+</sup>, each 50), 183 and 181 (C<sub>4</sub>H<sub>6</sub>BrO<sub>3</sub><sup>+</sup>, each 100) and 169 (100).

Reaction involving the propenoate 32c and propan-1-ol. The reaction of the propenoate  $32c^4$  (2.30 g, 5.0 mmol) in propan-1-ol (25 cm<sup>3</sup>) for 18 h gave rise to a residue comprising mainly an 85:15 mixture of the bromo(propoxy) adducts 33c and 34c [the ratio was estimated from the heights of the singlets at  $\delta$  22.6 and 23.2 (attributed to the MeCH<sub>2</sub>CH<sub>2</sub> signals of 33c and 34c)].

Crystallisation of the material from propan-2-ol gave *ethyl* (2R,3R)-2-bromo-2-methyl-3-propoxy-3-(2',3',4',6'-tetra-O-

acetyl-β-D-glucopyranosyloxy)propanoate **33c** (2.18 g, 73%); mp 127 °C; [a]<sub>D</sub> -15 (c 0.9, CH<sub>2</sub>Cl<sub>2</sub>) (Found: C, 46.0; H, 6.2; Br, 13.4. C<sub>23</sub>H<sub>35</sub>BrO<sub>13</sub> requires C, 46.1; H, 5.9; Br, 13.3%); v<sub>max</sub> (KBr)/cm<sup>-1</sup> 1760, 1740 and 1730 (ester C=O);  $\delta_{\rm H}$  (300 MHz; CDCl<sub>3</sub>) 0.82 (3 H, t, J 7.5, MeCH<sub>2</sub>CH<sub>2</sub>), 1.30 (3 H, t, J 7, MeCH<sub>2</sub>O), 1.43-1.58 (2 H, m, MeCH<sub>2</sub>CH<sub>2</sub>), 1.79 (3 H, s, 2-Me), 2.02, 2.04, 2.06 and 2.08 (each 3 H, s, 4 × MeCO<sub>2</sub>), 3.34 and 3.88 (each 1 H, dt, J 9 and 6.5, EtCH<sub>2</sub>O), 3.77 (1 H, ddd, J 2.5, 5 and 10, 5'-H), 4.13-4.27 (4 H, m, 6'-H<sub>2</sub> and MeCH<sub>2</sub>O), 4.85 (1 H, d, J 7.5, 1'-H), 5.03-5.15 (2 H, m, 2'- and 4'-H), 5.07 (1H, s, 3-H) and 5.27 (1 H, t, J 9.5, 3'-H);  $\delta_{\rm C}$  (100 MHz; CDCl<sub>3</sub>) 10.5 (CH<sub>3</sub>CH<sub>2</sub>CH<sub>2</sub>), 14.0 (CH<sub>3</sub>CH<sub>2</sub>O), 19.5 (CH<sub>3</sub>C), 20.7 and 21.1 (4 × CH<sub>3</sub>CO<sub>2</sub>), 22.6 (MeCH<sub>2</sub>CH<sub>2</sub>), 60.5 (2-C), 62.2 (6'-CH<sub>2</sub>), 68.6, 71.2, 72.0 and 72.6 (2'-, 3'-, 4'- and 5'-CH), 71.7 (2×CH<sub>2</sub>O), 100.9 (1'-CH), 105.2 (3-CH) and 169.1, 169.4, 169.5, 170.3 and 170.5 (1-CO and 4 × MeCO); m/z (FAB) 623 and 621 (MNa<sup>+</sup>, each 30%), 331 ( $C_{14}H_{19}O_{9}^{+}$ , 100), 253 and 251  $(C_9H_{16}BrO_3^+, each 70)$ , 211 and 209  $(C_6H_{10}BrO_3^+, each 95)$  and 169 (55).

Reaction involving the methylenebutyrolactone 37a and propan-1-ol. The reaction of the butyrolactone  $37a^4$  (0.500 g, 1.13 mmol) in propan-1-ol (20 cm<sup>3</sup>) for 2 h gave rise to a product comprising mainly an 85:15 mixture of the bromo-(propoxy) adducts **38a** and **39a** [the ratio was estimated from the heights of the singlets at  $\delta$  22.6 and 23.1 (attributed to the MeCH<sub>2</sub> signals of **38a** and **39a**)];  $\approx$ 11% of succinimide was also present.

Crystallisation of the mixture from cold methanol gave (aR)a-bromo-a-[(R)-propoxy-(2',3',4',6'-tetra-O-acetyl-β-D-glucopyranosyloxy)methyl]-y-butyrolactone 38a (0.357 g, 54%); mp 145–148 °C;  $[a]_{\rm D}$  –17 (c 0.5, CH<sub>2</sub>Cl<sub>2</sub>) (Found: C, 45.0; H, 5.3; Br, 13.8. C<sub>22</sub>H<sub>31</sub>BrO<sub>13</sub> requires C, 45.3; H, 5.4; Br, 13.7%);  $v_{max}$ (KBr)/cm<sup>-1</sup> 1775 ( $\gamma$ -lactone C=O) and 1755 and 1745 (ester C=O); δ<sub>H</sub> (300 MHz; CDCl<sub>3</sub>) 0.84 (3 H, t, J 7.5, MeCH<sub>2</sub>), 1.53 (2 H, sextet, separation 7, MeCH<sub>2</sub>), 2.02, 2.05 and 2.06 (3, 3 and 6 H, each s,  $4 \times \text{MeCO}_2$ ), 2.31 and 3.07 [each 1 H, ddd (J 2.5, 5.5 and 15) and dt (J 15 and 9), β-H<sub>2</sub>], 3.47 and 3.89 [each 1 H, dt (J 9 and 7) and dt (J 9 and 6.5), EtCH<sub>2</sub>O], 3.77 (1 H, ddd, J 2.5, 5.5 and 10, 5'-H), 4.15 and 4.22 [each 1 H, dd (J 5.5 and 12.5) and dd (J 2.5 and 12.5), 6'-H<sub>2</sub>], 4.32–4.47 (2 H, m, γ-H<sub>2</sub>), 4.85 (1 H, d, J 8, 1'-H), 5.03 (1 H, s, OCHO), 5.05 (1 H, t, J 9.5, 4'-H), 5.10 (1 H, dd, J 8 and 9.5, 2'-H) and 5.27 (1 H, t, J 9.5, 3'-H);  $\delta_{\rm C}$  (100 MHz; CDCl<sub>3</sub>) 10.4 (CH<sub>3</sub>CH<sub>2</sub>), 20.7 and 21.1  $(4 \times CH_3CO_2)$ , 22.6 (MeCH<sub>2</sub>), 32.7 ( $\beta$ -CH<sub>2</sub>), 58.0 ( $\alpha$ -C), 62.2 (6'-CH<sub>2</sub>), 66.2 (γ-CH<sub>2</sub>), 68.5, 71.3, 72.2 and 72.5 (2'-, 3'-, 4'- and 5'-CH), 72.5 (EtCH<sub>2</sub>), 100.9 (1'-CH), 104.4 (OCHO),

169.2, 169.5, 170.2 and 170.5 (4 × MeCO) and 172.4 ( $\gamma$ -lactone CO); m/z (FAB) 331 ( $C_{14}H_{19}O_{9}^{+}$ , 90%), 237 and 235 ( $C_{8}H_{12}BrO_{3}^{+}$ , each 20), 195 and 193 ( $C_{5}H_{6}BrO_{3}^{+}$ , each 50) and 169 (100).

Reaction involving the methylenevalerolactone **37b** and propan-*1-ol.* The reaction of valerolactone **37b**<sup>4</sup> (0.450 g, 0.98 mmol) in propan-1-ol (20 cm<sup>3</sup>) for 2 h gave rise to a product comprising mainly a 90:10 mixture of the bromo(propoxy) adducts **38b** and **39b** [the ratio was estimated from the heights of the singlets at  $\delta$  22.6 and 23.1 (attributed to the MeCH<sub>2</sub> signals of **38b** and **39b**)].

Crystallisation of the mixture from dichloromethane-diethyl ether-hexanes gave (aR)-a-bromo-a-[(R)-propoxy-(2',3',4',6'*tetra-O-acetyl-β-D-glucopyranosyloxy*)*methyl*]-δ-valerolactone **38b** (0.390 g, 66%); mp 155 °C; [a]<sub>D</sub> -35 (c 0.8, CH<sub>2</sub>Cl<sub>2</sub>) (Found: C, 46.3; H, 5.5; Br, 13.1. ### Auxiliary-detachment studies

**General procedure.** A mixture of the bromo(alkoxy) compound (1 mmol), ethane-1,2-diol (0.62 g, 10 mmol) and TFA (5 cm<sup>3</sup>) was stirred for 2 h and then partitioned between dichloromethane and water. The organic phase was washed successively with aq. sodium hydrogen carbonate and water, dried (MgSO<sub>4</sub>) and concentrated to leave mainly a 50:50 mixture of the ethylene glycol acetal and the tetraacetate 13 by <sup>1</sup>H NMR spectroscopy. A solution of the product in methanol (20 cm<sup>3</sup>) containing toluene-*p*-sulfonic acid monohydrate (0.200 g) was left overnight and concentrated. The residue was then partitioned between dichloromethane and water. Evaporation of the dried (MgSO<sub>4</sub>) organic phase gave the ethylene glycol acetal.

(3R)-3-Bromo-3-(1',3'-dioxolan-2'-yl)butan-2-one **40a**. (a) The reaction involving the bromo(propoxy) compound **11c** (0.500 g, 0.88 mmol) gave rise to the *title compound* **40a** (0.123 g, 63%) as a near-pure oil. A chromatographed sample showed [a]<sub>D</sub> -33 (c 0.85, CH<sub>2</sub>Cl<sub>2</sub>) (Found: C, 37.7; H, 5.0; Br, 36.0. C<sub>7</sub>H<sub>11</sub>BrO<sub>3</sub> requires C, 37.7; H, 5.0; Br, 35.8%);  $\lambda_{max}$  (EtOH)/nm 296 ( $\epsilon$  90);  $\nu_{max}$  (film)/cm<sup>-1</sup> 1720 (ketone C=O);  $\delta_{H}$  (300 MHz; CDCl<sub>3</sub>) 1.77 (3 H, s, 4-H<sub>3</sub>), 2.44 (3 H, s, 1-H<sub>3</sub>), 3.96–4.13 (4 H, m, 4'- and 5'-H<sub>2</sub>) and 5.30 (1 H, s, 2'-H);  $\delta_{C}$  (100 MHz; CDCl<sub>3</sub>) 20.9 (4-CH<sub>3</sub>), 26.3 (1-CH<sub>3</sub>), 66.1 and 66.4 (4'- and 5'-CH<sub>2</sub>), 67.2 (3-C), 105.0 (2'-CH) and 201.6 (2-CO); m/z (CI) 242 and 240 (MNH<sub>4</sub><sup>+</sup>, each 100%).

By HPLC analysis, the sample possessed an ee of 98% [hexanes–Me<sub>2</sub>CHOH (99:1) as eluent with a flow rate of 0.75 cm<sup>3</sup> min<sup>-1</sup>; retention times: 9.0 min for **40a** and 10.0 min for *ent*-**40a**].

(b) The aforecited reaction was repeated but the mixture was partitioned between dichloromethane and 5% aq. sodium

hydroxide. After having been washed with water  $(2 \times)$ , the organic phase was dried (MgSO<sub>4</sub>) and concentrated to leave compound **40a** (0.102 g, 52%) with an ee of 95%.

(2*R*)-2-Bromo-2-(1',3'-dioxolan-2'-yl)pentan-3-one **40b**. The reaction involving the bromo(propoxy) compound **28** (1.24 g, 2.1 mmol) gave rise to the *title compound* **40b** (0.290 g, 58%) as a near-pure oil. A chromatographed sample showed  $[a]_D$  –18 (*c* 0.5, CH<sub>2</sub>Cl<sub>2</sub>) (Found: C, 40.8; H, 5.6; Br, 33.4. C<sub>8</sub>H<sub>13</sub>BrO<sub>3</sub> requires C, 40.5; H, 5.5; Br, 33.7%);  $\lambda_{max}$  (EtOH)/nm 295 (*e* 100);  $\nu_{max}$  (film)/cm<sup>-1</sup> 1720 (ketone C=O);  $\delta_H$  (300 MHz; CDCl<sub>3</sub>) 1.10 (3 H, t, *J* 7, 5-H<sub>3</sub>), 1.79 (3 H, s, 1-H<sub>3</sub>), 2.70–2.98 (2 H, m, 4-H<sub>2</sub>), 3.95–4.13 (4 H, m, 4'- and 5'-H<sub>2</sub>) and 5.31 (1 H, s, 2'-H);  $\delta_C$  (100 MHz; CDCl<sub>3</sub>) 8.4 (5-CH<sub>3</sub>), 21.2 (1-CH<sub>3</sub>), 31.8 (4-CH<sub>2</sub>), 66.2 and 66.5 (4'- and 5'-CH<sub>2</sub>), 67.6 (3-C), 105.1 (2'-CH) and 204.9 (3-CO); *m*/*z* (FAB) 239 and 237 (MH<sup>+</sup>, each 100%) and 157 (C<sub>8</sub>H<sub>13</sub>O<sub>3</sub><sup>+</sup>, 90).

By HPLC analysis, the sample possessed an ee of 94% [hexanes–Me<sub>2</sub>CHOH (99:1) as eluent with a flow rate of 0.75 cm<sup>3</sup> min<sup>-1</sup>; retention times: 7.9 min for **40b** and 8.7 min for *ent*-**40b**].

### (2R)-2-Bromo-2-(1',3'-dioxolan-2'-yl)cyclohexan-1-one

41. TFA (2.75 cm<sup>3</sup>) was added to the bromo(propoxy) compound 30b (0.549 g, 0.92 mmol) followed, after 20 min, by ethane-1,2-diol (0.544 g, 8.8 mmol). After 15 min, the mixture was diluted with dichloromethane and washed successively with water  $(3 \times)$  and aq. sodium hydrogen carbonate. Evaporation of the dried (MgSO<sub>4</sub>) organic phase and subjection of the product to column chromatography [light petroleum-EtOAc (1:1) as eluent] gave the title compound 41 (0.128 g, 56%) as an oil that solidified; mp 33 °C;  $[a]_D$  +225 (c 0.75, CH<sub>2</sub>Cl<sub>2</sub>) (Found: C, 43.3; H, 5.3; Br, 31.9. C<sub>9</sub>H<sub>13</sub>BrO<sub>3</sub> requires C, 43.4; H, 5.3; Br, 32.1%);  $v_{\text{max}}$  (film)/cm<sup>-1</sup> 1720 (ketone C=O);  $\delta_{\text{H}}$  (300 MHz; CDCl<sub>3</sub>) 1.59–1.77, 1.82–1.92, 1.98–2.14 and 2.27–2.45 (1, 1, 3 and 2 H, each m, 3-, 4- and 5-H\_2 and 6-H\_{eq}), 3.14 (1 H, dt, J 6.5 and 14.5, 6-H<sub>ax</sub>), 3.96-4.15 (4 H, m, 4'- and 5'-H<sub>2</sub>) and 5.45 (1 H, s, 2'-H);  $\delta_{\rm C}$  (100 MHz; CDCl<sub>3</sub>) 21.3, 26.3, 33.6 and 37.6 (3-, 4-, 5- and 6-CH<sub>2</sub>), 66.3 and 66.9 (4'and 5'-CH<sub>2</sub>), 68.2 (2-C), 104.2 (2'-CH) and 203.7 (1-CO); m/z (FAB) 251, 249 and 247 (MH<sup>+</sup> and M – H<sup>+</sup>, 6, 12 and 6%) and 73 (100) [(after addition of KI) 289 and 287 (MK<sup>+</sup>, 100 and 70%)].

By HPLC analysis, the sample possessed an ee of 96% [hexanes–Me<sub>2</sub>CHOH (98:2) as eluent with a flow rate of 1 cm<sup>3</sup> min<sup>-1</sup>; retention times: 11.2 min for **41** and 10.8 min for *ent*-**41**].

*Ethyl* (2*R*)-2-bromo-2-(1',3'-dioxolan-2'-yl)propanoate 40c. The reaction involving the bromo(propoxy) compound 33c (0.599 g, 1.00 mmol) gave rise to the *title compound* 40c (0.169 g, 67%) as a near-pure oil. A chromatographed sample showed  $[a]_{\rm D}$  +9 (c 1.67, CH<sub>2</sub>Cl<sub>2</sub>) (Found: C, 38.1; H, 5.0; Br, 32.0. C<sub>8</sub>H<sub>13</sub>BrO<sub>4</sub> requires C, 38.0; H, 5.2; Br, 31.6%);  $\nu_{\rm max}$  (film)/ cm<sup>-1</sup> 1740 (ester C=O);  $\delta_{\rm H}$  (300 MHz; CDCl<sub>3</sub>) 1.31 (3 H, t, J 7, MeCH<sub>2</sub>), 1.82 (3 H, s, 3-H<sub>3</sub>), 3.97–4.14 (4 H, m, 4'- and 5'-H<sub>2</sub>), 4.27 (2 H, q, J 7, MeCH<sub>2</sub>O) and 5.45 (1 H, s, 2'-H);  $\delta_{\rm C}$  (100 MHz; CDCl<sub>3</sub>) 14.0 (*C*H<sub>3</sub>CH<sub>2</sub>), 21.0 (3-CH<sub>3</sub>), 60.0 (2-C), 62.5 (MeCH<sub>2</sub>), 66.4 and 66.8 (4'- and 5'-CH<sub>2</sub>), 105.2 (2'-CH) and 169.4 (1-CO); *m*/*z* (CI) 272 and 270 (MNH<sub>4</sub><sup>+</sup>, each 100%), 255 and 253 (MH<sup>+</sup>, each 20), 192 (80) and 175 (50).

By HPLC analysis, the sample possessed an ee of 98% [hexanes–Me<sub>2</sub>CHOH (99:1) as eluent with a flow rate of 0.75 cm<sup>3</sup> min<sup>-1</sup>; retention times: 8.7 min for **40c** and 10.0 min for *ent*-**40c**].

### Crystal structure determination of compound 11c

**Crystal data.**  $C_{22}H_{33}BrO_{12}$ , M = 569.39, orthorhombic, a = 11.952(2), b = 13.551(2), c = 17.076(3) Å, V = 2765.8(8) Å<sup>3</sup>, T = 293(2) K, space group  $P2_12_12_1$ , Z = 4,  $\mu$ (Mo-K $\alpha$ ) = 1.542 mm<sup>-1</sup>, 1879 reflections measured, 1824 unique ( $R_{int} = 0.043$ ) which were used in all calculations. The final  $wR(F^2)$  was 0.144 (all data). CCDC reference number 207/435. See http:// www.rsc.org/suppdata/p1/b0/b002749i/ for crystallographic files in .cif format.

# Acknowledgements

We thank the SERC for a research grant (GR/E/70238) and a research studentship (to P. D. T.), the EPSRC for research grants (GR/L/52246 to assist in the purchase of a 400 MHz NMR spectrometer and GR/L/34391 to assist in the purchase of HPLC equipment), and the Universiti Teknologi, Malaysia, for providing sabbatical leave (to M. S. I.). We are also grateful to Dr R. Perry for the elemental analyses, Mr K. Walkling for recording the UV and IR spectra, Mr C. Evans for measuring the NMR spectra, Mr R. Perkins for the mass spectral determinations and Dr C. M. Raynor and Mr G. Hughes for the chiral HPLC analyses.
