Received March 1, 1971

Syntheses and biological activities are reported for 24 of the title compds. The most active compds were 6-methoxy-3- $\{p-[2-(1-pyrrolidy])ethoxy]phenyl\}-2-phenylbenzo[b]thiophene (3m) and 3,4-dihydro-7-methoxy-3-phenyl-4-hydroxy-4-<math>\{p-[2-(1-pyrrolidy])ethoxy]phenyl\}-1H-2-benzothiapyran (11a)$. In addition to the title compds, a dibenzo[b,e]thiepin (20) containing some of the structural features of 11a is reported; this structural modification resulted in loss of activity. Both 3m and 11a afford complete protection against pregnancy in rats at doses of 0.1 mg/kg. The compds exhibit a rapidly plateauing uterotropic activity in the rat which does not approach the maxima seen with known potent estrogens.

A number of triaryl ethylene derivatives of the general structure I are potent antifertility agents in rodents

owing to their estrogenic and/or estrogen antagonist activities. Among these are derivatives in which X is H, alkyl, halo, CN, and NO₂.^{2,3} A similar type of activity, often with increased potency, has been demonstrated with compounds of structural type II, which may be viewed as "cyclized" triaryl ethylenes.³ For example, Lednicer and associates have reported a series of variously substituted 2,3-diarylindenes (IIa)⁴ and 1,2-diaryl-3,4-dihydronaphthalenes (IIb)⁵ as potent antifertility agents. Showing similar biological activities, but with lowered potency, have been 2,3-diarylindoles (IIc)⁶ and 3,4-diarylchromenes (IId) and derivatives.⁷ In a research program started several years ago in these laboratories, we sought structures of type II containing S and O (IIe–IIh).¹ We now report synthesis and biological properties of compounds of type IIe-IIh and related structures.

Some of these compds have been described in the following patents:
 (a) R. R. Crenshaw, U. S. Patent 3,413,305 (1968);
 (b) R. R. Crenshaw, U. S. Patent 3,394,125 (1968);
 (c) R. R. Crenshaw, U. S. Patent 3,332,956 (1967);
 (d) R. R. Crenshaw, U. S. Patent 3,321,483 (1967).

Chemistry.—The benzo[b]thiophene nucleus was formed for most of the compounds as outlined in Scheme I.⁸ The requisite α -bromo ketones 1 were prepared in

essentially quantitative yield using CuBr_2 with the corresponding deoxybenzoins according to King and Ostrum.⁹ Reaction of 1 with arylthiolate anions produced the α -arylthio-substituted ketones 2 which were cyclized in polyphosphoric acid to the benzo[b]-thiophenes 3a-3g (Table I). These then were elaborated further through alkylation, or demethylation followed by alkylation, to produce the substituted benzo[b]-thiophenes 3m-3q. No identifiable benzo[b]-thiophenes could be isolated from attempted cyclization of the ketones 2h-2j (Table II).

An alternative route was used for formation of the benzo[b]thiophene nucleus containing a 5-NO₂ substituent (Scheme II). The activated chloro group of 4 was displaced by α -toluenethiol to yield 5 which was cyclized with KO-tert-Bu to the 5-nitrobenzo[b]thiophene **3h**. The NO₂ group then was modified through reduction and subsequent acylation to yield benzo[b]thiophenes **3i-3j**. Scheme II is related to work by Middleton in which 2-carboxy-substituted benzo[b]thiophenes were prepared from the reaction of mercaptoacetic acid with 2-chloro-5-nitrobenzophenone followed by cyclization.¹⁰ It was hoped that the 5aminobenzo[b]thiophene **3i** might serve as a precursor to the 5-OH-substituted relative which had proved

inaccessible from cyclization of the ketone 2j. However, treatment of the diazonium salt of 3i with aq H₂SO₄ gave a mixture of unidentified products from which none of the desired 5-OH-substituted benzo[b]thiophene was isolated. A series of 2,3-diarylbenzo[b]furans has been reported by Grover, et al.,¹¹ to possess antifertility activity. A similar series of compounds was synthesized independently in these laboratories^{1b} using a synthetic approach (cf. Scheme III) different from that used by Grover. The most potent compound in our series was **8b**.

The 1*H*-2 and 2*H*-1 benzothiapyran derivatives were prepared as outlined in Schemes IV and V, resp. The biologically active alcohol derivatives **11** and **16** appear to be homogeneous (tlc, free bases; mp unchanged by repeated recrystallizations) and, if so, represent only one of two possible diastereoisomeric forms.

The alcohols 11 and 16 in both series were formed in low yields. For 11 the low yield was shown to result

 ^{(11) (}a) P. K. Grover, H. P. S. Chawla, N. Anand, V. P. Kamboj, and A. B. Kar, J. Med. Chem., 8, 720 (1965); (b) H. P. S. Chawla, P. K. Grover, N. Anand, V. P. Kamboj, and A. B. Kar, *ibid.*, 13, 54 (1970).

from acidity of the ketone 10, rather than from steric hindrance, on the basis of an experiment in which the Grignard adduct of 10 was decomposed with D_2O . Nmr analysis of the unreacted ketone 10 which was recovered showed 75% incorporation of D α to C==O; additionally, N-(2-phenoxyethyl)pyrrolidine which was isolated showed no evidence (nmr) for p-D incorporation.

Dehydration of the 2H-1 benzothiapyran derivative 16 with HCl in EtOH yielded the expected product 17. In contrast, treatment of the 1H-2 derivative 11a under the same conditions gave a product 12 which has not been unequivocally established as having structure 12a.

Although elemental analyses, ir, uv, and mass spectral data were consistent for 12a, 100-MHz nmr spectra showed anomalies (cf. Experimental Section). However, an nmr spectrum of the product 12 in F_3CCO_2D is consistent for the cationic structure 12b which could be expected to arise from treatment of a structure such as 12a with strong acid.^{12,13} The uv spectrum of 12 after treatment with F_3CCO_2H is likewise consistent for a transformation of 12a to 12b with absorption extending into the visible region.¹³

The potent antifertility activity shown by 11a suggested synthesis of the dibenzothiepin 20 which has some structural similarities with 11a. Synthesis of 20 proceeded without difficulty (Scheme VI), but the

compound proved devoid of activity.

Biological Activity.—All of the compounds reported herein were initially screened for antifertility activity

in mice. The dosing regimen entailed oral administration of the drug for 9 days over an 11-day period. The dosing schedule involved both pre- and postcoital administration. All antifertility doses reported represent daily doses. Estrogenic and antiestrogenic activities were determined by uterine weight responses in immature 21-day-old mice and rats. The animals were dosed orally for 3 days and were autopsied on day 4. In the antiestrogenic assays, the dosing regimen was the same with the exception that the compounds were given together with ethyinyl estradiol (EE). For both the estrogenic and antiestrogenic assays, the doses reported represent the total amount of drug per animal for the 3-day period. Gonadotropin inhibition was determined by oral administration of the compounds to 28-day-old male rats for 7 days. The weights of the testes, ventral prostate, and seminal vesicles were used as the end points for gonadotropin inhibition. Hypocholesteremic activity was ascertained in mature male rats after a 4-day or 30-day oral dosing schedule. It is our intent to present data for the representative compounds.

Estrogenic and Antiestrogenic Activities.-In the mouse, **3a** and **3d** exhibit doubling of uterine weight at 1000 μ g/animal. Compound **3h** appears to be inactive. In the rat these compounds are less estrogenic than in the mouse. In the same series addition of the basic side chain (3m) produces a compound that exhibits potent uterotropic activity in the mouse. At 1 $\mu g/$ mouse **3m** has activity approximating that of 1 μ g of EE. At 0.1 μ g, **3m** is less potent than 0.1 μ g of EE. At higher doses (10 and 100 μ g), **3m** exhibits autoinhibitory properties, with lower uterine weights seen at these higher doses than with lower doses of 3m. In the mouse the compound has definite antiestrogenic properties with resultant uterine weights following concomitant **3m** (100 μ g) and EE (1 μ g) administration being lower than one observes with the same dose of **3m** alone. In the immature female rat, doubling of uterine weight is seen at 10 μ g/animal of **3m**. No further increases in uterine weight are seen at doses 200-fold higher. This compound is also a potent antiestrogen in rats. Unlike the situation observed in the mouse, in the rat concomitant dosing of EE and 3m gave no inhibition of uterine weight below that produced by the antagonist **3m** alone.

In the mouse uterine weight assay, **11a** administered at 10 μ g produces weights equivalent to 1 μ g of EE. Its antiestrogenic activity in the mouse is similar to that of **3m**. In the rat estrogenic and antiestrogenic assays, activity of **11a** parallels that of **3m**. Product **12** in the mouse is only weakly estrogenic and produces doubling of uterine weight at 100 μ g.

Compound **8b** is weakly uterotropic in both mice and rats, significant increases in the mouse occurring at 100 μ g and in the rat at 1000 μ g. Compared to **3m** and **11a**, it does not exhibit antiestrogenic activity in the rat.

Compound 16 doubles mouse uterine weight at 10 μ g/mouse. In the rat doubling of uterine weight occurs at 100 μ g. Chemical dehydration to yield 17 lowered estrogenicity considerably both in the mouse and the rat. Compound 20 was not estrogenic in either mice or rats up to 1000 μ g.

Antifertility Activity.—The antifertility activity of compounds in this series closely parallels their estro-

genicity with the exception of **3h.** Compounds **3a**, **3d**, **3h**, **3l**, **3n**, and **3q** were active in mice at 50 mg/kg but not at lower doses. The two most active compounds were **3m** and **11a**. In mice, the MED₁₀₀ for **3m** was 0.1 mg/kg and for **11a** was 0.25 mg/kg. These doses are essentially the same for a postcoital dosing schedule (days 1-5 of pregnancy). In the rat both of these compounds are effective at 0.1 mg/kg in postcoital assays.

In mice, an MED_{100} of 10 mg/kg was seen with 8b and 16. Compounds 12, 17, and 20 gave incomplete protection in mice at 10 mg/kg.

Gonadotropin Inhibition.-Compound 3m was tested for its gonadotropin inhibitory activity in immature (28-day-old) male rats. At 5 mg/kg and a dosing schedule of 7 days there was a nonsignificant reduction in testes weights, whereas the ventral prostate and seminal vesicles were significantly reduced in weight. No dose-response could be established because toxicity was encountered at 20 mg/kg. In our assays, the gonadotropin inhibition and toxicity of this compound are of the same order as that of the corresponding 3,4dihydronaphthalene (nafoxidine · HCl).¹⁴ Compound 11a produced a nonsignificant depression of testes, ventral prostate, and seminal vesicles weights. In doses of up to and including 40 mg/kg, no dose-response relationship could be established. No toxicity was observed at the doses employed.

Hypocholesteremic Activity.—Serum cholesterol values were determined in mature male rats dosed with **3m** for 4 or 30 days. Rats dosed for 4 days exhibited a significant depression (-46% p < 0.001) of serum cholesterol levels at 2.5 mg/kg. This depression was not accompanied by changes in weight of the testes or the accessory sexual organs. In the 30-day study no significant effect was observed at the dose of 5.0 mg/kg. These data suggest a possible biphasic effect of **3m** on serum cholesterol that has been previously reported by Uchida, *et al.*,¹⁵ for a number of estrogens.

Experimental Section¹⁶

A. Benzo[b]thiophenes. 4-Hydroxyphenyl α -Bromobenzyl Ketone (1, $\mathbb{R}^2 = OH$; $\mathbb{R}^3 = H$).—A mixt of 4-hydroxyphenyl benzyl ketone (22.0 g, 0.104 mole) and CuBr₂ (46.6 g, 0.208 mole) in CHCl₃ (105 ml) and EtOAc (130 ml) was stirred under reflux for 2 hr.^o The mixt was filtered and the filtrate was evapd. Trituration of the residue under Skellysolve B gave the title compd, 27.9 g (93%), mp 162–163.5°; the nmr spectrum (CDCl₃, DMSO-d₆) exhibited a singlet (1 H) for CHBr at δ 6.7 with no evidence for nuclear bromination, α -dibromination, or unchanged starting material.

4-Hydroxyphenyl α -(3-Methoxyphenylthio)benzyl Ketone (2a).—A soln of 4-hydroxyphenyl α -bromobenzyl ketone (15.0 g, 0.052 mole) in CHCl₃ (50 ml) and THF (35 ml) was added to a soln of *m*-methoxythiophenol (7.6 g, 0.054 mole) in abs EtOH (25 ml) contg NaOEt (0.054 mole). The mixt was heated at reflux for 3 hr. The solvent was replaced by Et₂O and the resultant soln washed with aq NaOH and H₂O. Evapn yielded

^{(14) 3,4-}Dihydro-6-methoxy-2-phenyl-1-{p-[2-(1-pyrrolidyl)ethoxy]phenyl}naphthalene+HCl; cf. ref 5b.

⁽¹⁵⁾ K. Uchida, M. Kadowaki, K. Miyata, and T. Miyake, Endocrinol. Jap., 16, 211 (1969).

⁽¹⁶⁾ Melting points are capillary and are uncorrected. All compds had consistent ir and nmr spectra for assigned structures. Routine nmr spectral data were obtained using a Varian A-60 spectrometer. Nmr data reported for **11a** and **12** were obtd on a Varian HA-100 spectrometer. Mass spectral data was obtd on a LKB 9000 mass spectrometer. Where elemental analyses are indicated by symbols of the elements, anal. results were within $\pm 0.4\%$ of the theor values.

2a: 15.2 g (84%); mp 142-143° after recrystn (aq EtOH). Anal. (C₂₁H₁₈O₃S) C, H.

6-Methoxy-3-(p-hydroxyphenyl)-2-phenylbenzo[b] thiophene (3a).—A mixt of the ketone 2a (12.3 g) and PPA¹⁷ (256 g) was heated at 90° for 1 hr. It was then poured onto ice and extd with CHCl₃. The exts were washed with H₂O, dried, and then evapd to give solid 3a (8.3 g, 71%). An anal. sample (C₆H₆) had mp 177-179°. Anal. (C₂₁H₁₆O₂S) C, H, S. Similarly prepared were 3b-3g; reaction condus in PPA: 3b (190°/3.5 hr); 3c, 3d, 3f (90-100°/1 hr); 3e (180°/3.5 hr); 3g (135-150°/2.5 hr).

6-Methoxy-3- {p-[2-(N-pyrrolidyl)ethoxy]phenyl}-2-phenylbenzo[b]thiophene HCl (3m).—NaH (0.21 mole) dispersion in oil was added to 3a (64.1 g, 0.19 mole) in DMF (720 ml) at 4°. The mixt was stirred at 34° for 2 hr, and then a soln of N-(β chloroethyl)pyrrolidine (32.4 g, 0.24 mole; freshly prepd from the HCl salt) in DMF (140 ml) was added. The resultant mixt was stirred at 55-60° for 1 hr, and then at 25° for 16 hr. A few ml of EtOH was added and the DMF was then removed at 5 mm. The solid obtained was triturated under 1 N HCl (245 ml). The mixt was then extd with CHCl₃ which was washed with H₂O and dried. Evapn of the CHCl₃ left a solid which was recrystd from CH₂Cl₂ (275 ml)-EtOAc (400 ml): yield of 3m, 64.0 g (71%); mp 204-207°. A second recrystn gave mp 207-208°. Anal. (C₂₇H₂₇NO₂S·HCl) C, H, N.

The same general method of alkylation was used for prepg 3n-3q. The pyrrolidone 3n was purified by chromatog on silica gel.

6-Hydroxy-3-(p-hydroxyphenyl)-2-phenylbenzo[b] thiophene (3k) was prepd from 3a (11.00 g, 0.033 mole) and BBr₃ (16.70 g, 0.066 mole) using the method of McOmie, *et al*.¹⁸ yield, 7.9 g (74%); mp 269-271° (*p*-dioxane). *Anal.* (C₂₀H₁₄O₂S) C, H, S. Compd 31 was prepd similarly from 3d.

2-Benzylthio-5-nitro-4'-methoxybenzophenone (5).—A mixt of 2-chloro-5-nitro-4'-methoxybenzophenone¹⁹ (16.40 g, 0.056 mole), α -toluenethiol (6.98 g, 0.56 mole), and KOH (3.15 g) in EtOH (140 ml) was refluxed 3 hr. The product obtained was chromatogd (alumina; elution with Skellysolve B-C₆H₆) to yield 8.05 g of 5; recrystn (EtOH) gave mp 123-125°. Anal. (C₂₁-H₁₇NO₄S) C, H, S.

3-(p-Methoxyphenyl)-5-nitro-2-phenylbenzo[b]thiophene (3h). —KO-tert-Bu (4.30 g) was added to a refluxing soln (3.75 g) in dry tert-BuOH (140 ml). The mixt was heated under reflux for 25 min, and then was stirred at 25° for 12 hr. Dilution with H₂O gave 2.70 g. (79%) of **3h** which was recrystd (*i*-PrOH) to const mp 146–148°. Anal. (C₂₁H₁₅NO₃S) C, H, N, S.

5-Amino-3-(p-methoxyphenyl)-2-phenylbenzo[b] thiophene HCl (3i).—A suspension of 3h (1.54 g) and Raney Ni (2 g) in *i*-PrOH (55 ml) contg 85% hydrazine hydrate (2 ml) was refluxed 1 hr. The hot soln was filtered, and the filtrate was acidified with 1 N HCl and evapt to leave 3i (1.00 g); recrystn (MeOH-Et₂O) gave mp 244° dec. Anal. (C₂₁H₁₇NOS·HCl) C, H, Cl, N, S.²⁰

B. Benzo[b] furans. Benzyl p-(2-Chloroethoxy) phenyl Ketone (6).—A mixt of NaOH (3.46 g), benzyl p-hydroxyphenyl ketone (15.93 g), and 2-chloroethyl p-toluenesulfonate (20.3 g) in PhMe (150 ml) was stirred under reflux for 15 hr with provision for removal of H₂O. The cooled mixt was washed in succession with aq caustic, H₂O, and satd brine soln. Evapn left 14.70 g of 6 (71%), mp 105–107.5° (PhMe). Anal. (C_{1e}-H₁₅ClO₂) Cl.

p-(2-Chloroethoxy)phenyl α -(m-Methoxyphenoxy)benzyl Ketone (7).—A soln of m-methoxyphenol (4.05 g) in DMF (50 ml) was added to NaH dispersion (1 equiv) in DMF (50 ml). When H₂ evoln had ceased, a soln of α -bromobenzyl p-(2-chloroethoxy)phenyl ketone (11.50 g; from 6 and CuBr₂) in C₆H₆ (100 ml) was added and the mixt was heated under reflux for 16 hr. The solvent was removed, and the residue was dissolved in a mixt of C₆H₆ and Et₂O. The soln was washed with aq caustic and H₂O, and then was dried. Evapn, followed by removal of mineral oil by extn with Skellysolve B, yielded 7 as an oil, 12.90 g (99%). Anal. (C₂₃H₂₁ClO₄) Cl.

3-[p-(2-Chloroethoxy)phenyl]-6-methoxy-2-phenylbenzo[b]furan (8a).—A mixt of 7 (10.1 g) and PPA¹⁵ (563 g) was stirred at 94-108° for 4 hr. The cooled mixt was poured onto ice and then was extd with C_6H_6 . The C_6H_6 was washed with H_2O_1 , dried, and evapd to yield **8a** monohydrate (7.6 g, 80%), mp 97.5-100° (MeCN). Anal. (C₂₃H₁₉ClO₃·H₂O) Calcd: C, 69.61; H, 5.34; Cl, 8.93. Found: C, 69.28; H, 4.89; Cl, 8.48.

6-Methoxy-3- {p-[2-(N-pyrrolidyl)ethoxy]phenyl}-2-phenylbenzo[b]furan HCl (8b).—A soln of 8a (1.25 g) in pyrrolidine (10 ml) was heated under reflux for 3 hr. Excess pyrrolidine was removed and the residue was dissolved in C₆H₆. The C₆H₆ soln was extd with 1 N HCl, and the acid exts then were extd with CHCl₃. Drying and evapn of CHCl₃ left 8b (1.12 g, 75%): mp 210–213° (*i*-PrOH); reported^{11s} 209–210°. Anal. (C₂₇-H₂₇NO₈·HCl) C, H, N.

C. Isothiapyrans. α -(m-Methoxybenzylthio)phenylacetic Acid (9).—A soln of α -bromophenylacetic acid (54.8 g) and mmethoxy- α -toluenethiol (39.2 g) in EtOH (185 ml) contg 1 N aq NaOH (508 ml) was kept at 22° for 17 hr to yield 9 (68.8 g, 94%) as an oil. The product gave a cryst hydrated Na salt, mp 93–95° (dioxane-Et₂O). Anal. (C₁₆H₁₅NaO₅S·H₂O) C, H.

7-Methoxy-3-phenyl-4-isothiochromanone (10).—A soln of SnCl₄ (18.8 ml) in C₆H₆ (48 ml) was added over 15 min to a soln at 0-5° of α -(*m*-methoxybenzylthio)phenylacetyl chloride (from 31.7 g of 9 and SOCl₂) in C₆H₆ (100 ml). The mixt was stirred at 0° an addnl 10 min, then was poured onto 36% HCl (165 ml) and ice. It was extd into Et₂O and the Et₂O was washed with aq NaHCO₃ and H₂O. The soln was dried, treated with charcoal, and evapd to an oil which was triturated under Skellysolve B to yield 10 (22.5 g, 76%), mp 70-73°. Recrystns (6:1 cyclohexane-Me₂CO) gave mp 85-86°. Anal. (C₁₆H₁₄O₂S) C, H, S.

3,4-Dihydro-7-methoxy-3-phenyl-4-hydroxy-4-{p-[2-(1-pyrrolidyl)ethoxy]phenyl}-1H-2-benzothiapyran HCl (11a).—A mixt of Mg turnings (9.0 g, 0.37 g-atom) and N-[2-(p-bromophenoxy)ethyl]pyrrolidine (100.0 g, 0.37 mole) in THF (1 l.) was stirred under reflux until all Mg had reacted (1 hr). A soln of the ketone 10 (100.0 g, 0.37 mole) in THF (1 l.) was added rapidly, and the resultant soln was heated under reflux for 16 hr. H_2O (37 ml) was added slowly at 0°, and the salts were removed by filtration. The filtrate was coned at 15 mm to remove most of the THF, and then was dild with Et₂O. The Et₂O was extd with aq 0.5 N HCl (3 \times 375 ml). The combined acid exts were extd with CH2Cl2. Drying and evapn of the CH₂Cl₂ gave a gum (40.0 g); recrystd from Me₂CO (200 ml) to yield 11a (23.6 g, 13%), mp 170-172° dec. Further recrystn (CH₂Cl₂-EtOAc) gave mp 176-177° dec; uv max (EtOH) 228 nm (sh) (log e 4.35), 275 (3.46), 282 (sh) (3.40); ir (Nujol)

3260 cm⁻¹ (OH); nmr (Pyr- d_5) δ 1.85 (m, 4, NCH₂(CH₂)₂CH₂),

3.24 (m, 4, $NCH_2(CH_2)_2CH_2$), 3.45 (t, 2, J = 5 Hz, CH_2N), 3.66 (s, 3, CH_3O), 3.78 (d, 1, J = 16 Hz, 0.5 CH_2S), 4.44 (d, 1, J = 16 Hz, 0.5 CH_2S), 4.51 (t, 2, J = 5 Hz, OCH_2CH_2), 4.90 (s, 1, C_6H_5CH), 5.75 (br, $OH + H_4O$ from Pyr), 6.8–7.6 (m, 12, arom; integral cor for undeuterated Pyr). A spectrum run in $CDCl_3$ showed resonance at δ 3.19 (s, 1, OH) exchangeable with D_2O ; mass spect (70 eV) m/e (rel intensity) 461 (M⁺) (2), 443 (2), 339 (11), 241 (25), 98 (24), 84 (100). Anal. ($C_{28}H_{31}NO_3S$ · HCl) C, H, N, S.

Similarly prepared using the ketone 10 and the appropriate Grignard reagent were the salts 11b (mp 186.5-187.5° dec) and 11c (mp 167-169° dec). Anal. for 11b ($C_{28}H_{33}NO_3S \cdot HCl$) C, H, Cl, N, S. Anal. for 11c $\cdot H_2O$ ($C_{26}H_{29}NO_3S \cdot HCl \cdot H_2O$) N, S.

Preparation of 12.—A suspension of **11a** (1.30 g) in abs EtOH (13 ml) was satd with HCl gas. The resultant soln was stored at 25° overnight and then was refluxed for 3 hr. Filtration of the cooled mixt gave **12** (0.28 g, 22%), mp 279–281° dec. Recrystn (aq *i*-PrOH) gave mp 285° dec; uv max (EtOH) 256 nm (log ϵ 4.19), 350 (3.76); ir (Nujol) shows no OH absorption;

nmr (Pyr- d_5 , D₂O) δ 1.98 (m, 4, NCH₂(CH₂)₂CH₂), 3.38 (m, 4,

 $NCH_2(CH_2)_2CH_2$, 3.52 (s, 3, CH₃O), 3.68 (t, 2, J = 5 Hz, OCH₂-CH₂N), 4.51 (t, 2, J = 5 Hz, OCH₂CH₂), 4.66 (s, 1, unknown), 6.8-7.6 (m, 12, arom; integral corrected for undeuterated Pyr); nmr (F₃CCO₂D) δ 2.30 (m, 4), 3.2-4.1 (m, 6), 4.17 (s, 3), 4.44 (t, 2), 6.9-8.2 (m, 12), 10.5 (s, 1, CH=S⁺).

Dissoln of 1.8 mg of 12 in a few ml of F_3CCO_2H , followed by diln with MeCN gave the following uv spectrum: 228 (log ϵ 5.85), 284 (5.77), 322 (sh) (5.12), 445 (4.69) nm. Essentially the same spectrum was seen upon dissoln of 12 in 70% HClO₄ and diln with MeCN.¹³ Anal. for 12 (C₂₈H₂₉NO₂S·HCl) Calcd: C, 70.05; H, 6.30; Cl, 7.39; N, 2.92; S, 6.68. Found: C, 69.90; H, 6.36; Cl, 7.17; N, 2.92; S, 6.88.

Treatment of 12 with aq NaOH gave the free base: mp 246-

250°; nmr (CDCl₃) § 1.83 (m, 4, NCH₂(CH₂)₂CH₂), 2.24 (s, 1,

OH?; exchanged with D₂O), 2.65 (m, 4, $NCH_2(CH_2)_2CH_2$), 2.90 (t, 2, OCH_2CH_2N), 3.27 (s, 3, CH_3O ?), 4.08 (t, 2, OCH_2CH_2), 4.14 (s, 1, unknown), 6.5–7.3 (m, 12, arom); mass spect (70 eV) m/e (rel intensity) 443 (M⁺) (43), 442 (98), 345 (32), 98 (41), 84 (100). A mol wt detd in soln (DMF; Mechrolab osmometer) indicated that the free base was monomeric; tlc in several solvents indicated homogeneity. Anal. (C₂₈H₂₉NO₂S) calcd mol wt: 443. Found: 540 (osmometer).

D. Thiapyrans. 3-(m-Methoxyphenylthio)-2-phenylpropionic Acid (13).—A mixt of atropic acid (10.45 g, 0.07 mole) and m-methoxythiophenol (9.88 g, 0.07 mole) was heated under N_2 at 125° for 20 hr.

The product was dissolved in Et_2O and the resultant soln was washed with 0.1 N I₂-KI soln and then was extd with NaOH. Acidification of the basic exts gave an oil which was extd into Et_2O . Washing, drying, and subsequent evapn of the Et_2O gave the acid 13 (15.59 g, 77%) as an oil; nmr indicated the addn to have occurred on the β -C; the product was used directly in the next step without further characterization.

7-Methoxy-3-phenyl-4-thiochromanone (14) and 5-methoxy-3phenyl-4-thiochromanone (15).—A mixt of the acid 13 (39.9 g) and PPA¹⁵ (798 g) was heated at 80-86° for 1 hr. The mixt was poured onto ice and then was extd with CHCl₃. The CHCl₃ exts were washed with aq NaHCO₃. Drying and evapn left an oil; recrystn (THF-Skellysolve B) gave 14 (11.0 g), mp 147-150°; further recrystn (EtOAc-Skellysolve B) gave mp 151-152.5°; nmr (DMSO-d₆) shows a downfield ortho-coupled doublet (δ 7.7, J = 7 Hz), consistent for the C-5 H deshielded by the adjacent C=O in support of the structural assignment 14. Anal. (C₁₆H₁₄O₂S) C, H; S: calcd, 11.86; found, 11.18.

Concn of the mother liquors yielded an addl 9 g of 14 (contaminated by 15 and other impurities). The product from the remaining mother liquors was chromatog (alumina; elution with PhMe) to yield a semisolid (6.2 g); recrystd several times (MeCN) to yield 15 (2.0 g), mp 128.5–132°; nmr arom multiplicity and absence of a downfield doublet in 7.5–8.0 region support the structural assignment 15. Anal. ($C_{16}H_{14}O_2S$) C, H, S.

3,4-Dihydro-7-methoxy-3-phenyl-4-hydroxy-4- {p-[2-(1-pyr-rolidyl)ethoxy]phenyl}-2H-1-benzothiapyran HCl (16).—Prepd from 14 (9.35 g) and N-[2-(p-bromophenoxy)ethyl]pyrrolidine (9.35 g) as described above for 11a: yield of 16, 2.11 g (12%); mp 172–173° dec (CH₃OH-Et₂O); uv max (EtOH), 222 (log e 4.62), 258 (4.21), 280 (sh) (3.92), 296 (sh) (3.63); ir (Nujol) 3320 cm⁻¹ (OH). Anal. (C₂₈H₃₁NO₃S·HCl) C, H, N, S.

7-Methoxy-3-phenyl-4-{p-[2-(1-pyrrolidyl)ethoxy]phenyl}-2H-1-benzothiapyran·HCl (17).—The alcohol 16 (1.70 g) was dehydrated by the procedure used for 12: yield of 17, 1.05 g (64%); mp 224-226° (CH₂Cl₂-EtOAc); uv max (EtOH), 250 (log ϵ 4.49), 262 (sh) (4.46), 319 (4.10); ir (Nujol) shows no OH absorption. Anal. (C₂₈H₂₉NO₂S·HCl) C, H, Cl, N, S.

E. Dibenzothiepins.—2-(*m*-Methoxybenzylthio)benzoic acid (18) was obtained from equimolar amts of *m*-methoxybenzylchloride and *o*-mercaptobenzoic acid in refluxing aq EtOH contg 2 equiv of NaHCO₃; mp 199-201° (Me₂CO-Skellysolve B). Anal. ($C_{15}H_{14}O_{3}S$) C, H, S.

8-Methoxydibenzo[b,e] thiepin-11(6H)-one (19) was prepd from the acid 18 (18.3 g) following the procedure described above for the isothiochromanone 10: yield, 12.2 g (72%); mp 110-111°. Anal. ($C_{15}H_{12}O_2S$) C, H, S.

8-Methoxy-11-hydroxy-11-{p-[2-(1-pyrrolidyl)ethoxy]phenyl}-6,11-dihydrodibenzo[b,e]thiepin HCl (20) was prepd from the ketone 19 (4.80 g) and N-[2-(p-bromophenoxy)ethyl]pyrrolidine (5.05 g) as described above for 11a: yield of 20, 3.10 g (34%); mp 183° dec. Anal. ($C_{27}H_{29}NO_3S \cdot HCl$) C, H, Cl, S.

Received February 17, 1971

The synthesis of a series of 17α -propadienyl (allenyl) steroids in the 19-nortestosterone and estradiol series is described. 17β -Hydroxy- 17α -propadienylestr-4-en-3-one (**3a**) and its 18-Me homolog (**3c**), the most active compounds of the former group, show oral progestational potencies 10 and 12 times 17α -ethynyl-19-nortestosterone, respectively.

The 17α -ethynyl-19-norsteroids are the first progestationally active compounds to receive widespread acceptance as oral contraceptive agents.³ Replacement of the 17α -ethynyl group in the 19-nortestosterone series by vinyl or allyl substituents leads to compounds with progestational activities comparable to their 17α -ethynyl counterparts. However, these latter substances also show androgenic and anabolic activity in experimental animals.⁴ A number of other 17α -baloethynyl,⁶

 17α -trihalovinyl,⁶ and 17α -butadiynyl⁷ have been incorporated into the 19-nortestosterone molecule. The chloroethynyl grouping showed the greatest activity enhancement relative to the 17α -ethynyl substituent, the progestational potency of 17α -chloroethynyl-19nortestosterone being 2–3 times the parent 17α -ethynyl-19-nortestosterone (norethindrone).⁶ This paper describes the synthesis and biological activity of a variety of 17α -propadienyl steroids in the estradiol and 19nortestosterone series.⁸ The 17α -propadienyl-19-nor-
